PREFACE

CONSIDERED in its entirety, with full regard for its record, the year 1933 was a year of achievement in the face of discouraging odds. The road to recovery, paved with common sense, was trodden with confidence. Most noteworthy among the elements that produced this condition in the United States was the vigor with which the Administration pressed drastic reforms. Supported by Congress, extraordinary powers were given to the Executive to cope with problems that the outgoing Administration had conceded threatened the country with virtual collapse.

Whereas a few years before, the attention of the world was fixed on the Five-Year Plan of the Union of Soviet Socialist Republics, in 1933 that attention was centred on the United States, and it is watching, not by any means uninterestedly, the progress of that nation. Viewed as a whole, the year was a period of trial tempered with triumph. In the loom of life, the shuttle wove its fabric with mixed yarn—with enough black in it to provoke pessimism in those pessimistically minded, but also with enough white to justify optimism in minds less morbid—a gray year in total blend of hues. As the months passed the sun of recovery appeared between the clouds to brighten that gray in places. Confidence was restored, spread rapidly, and the popular feeling was one of distinct faith in the future. With the return of that faith business gradually began to improve, and daily more people were employed. In the United States the new President won the confidence of the people by handling the financial situation promptly and resolutely, and later, by the introduction of measure after measure to relieve unemployment. In the face of defaulted obligations the United States suffered from the economic depression more severely than any other nation in the world; the country went through a grueling time. It was face to face with a national crisis that seemed in a fair way to become a catastrophe.

As presented in the accompanying pages the history of the year marks the turning point toward greater things. Prosperity, long proclaimed to be "just around the corner," did not reach that corner until urged forward vigorously by drastic reforms. The urgency of the situation called for emergency measures, and these emergency measures proved that honesty in business was a guarantee to the restoration of confidence. The one heartening lesson of this daring is its demonstration that enterprise has fully measured up with the obstacles that it faced. The rebound from depression not only inspired but caused actual achievement.

MR. PHILIP COAN, contributor of the articles on the UNITED STATES and the forty-eight STATES of the Union, summarized domestic developments as follows:

A dozen Acts, each greatly affecting the economic status of all the American population or a great part of it, became part of the law of the land; each is summarized for brief reference in the article on the *United States*. The inaugural-day crisis of 1933 compared in gravity with that of 1861; its course and solution are chronicled in that article. Therein are recorded also the Federal Administration's assumption of unprecedented powers, its sweeping alterations in the monetary system, its creation of a great group of organizations to regulate or succor every important branch of industry, and the means that it took to support, at public expense, millions of destitute victims of depression. The great majority of States passed laws of an exceptional nature and of great import to those affected, which are treated in articles on the several States. Also there are given data on the efforts made to cope with the difficulties of the leading cities and of public education. The United States have been covered with a view to meeting the need for a compact, readily consultable, permanent record of factual matter of prime importance, correlated by a single hand.

Overseas, as well as in lands to the south of us, the spirit of restlessness led to appeals to arms and brought about revolutions of which the end is not yet. Fighting continued during the year in China, Bolivia, and Paraguay. In Cuba, internecine disturbances brought about changes in administration. In India and in the Irish Free State disturbances of the public peace were caused by clashes of different races and factions. In Germany, the eccentricities of a virtual dictatorship helped to alienate the good will of those nations that held out the hand of fellowship. Almost daily charges of aggression were made by the Union of Soviet Socialist Republics against Japan. Spain continued in a state of ferment.

MR. RONALD S. KAIN, Associate Editor in charge of INTERNATIONAL RELATIONS AND FOREIGN AFFAIRS, reported developments of special interest in this field during 1933 as follows:

1. *Failure of the World Economic Conference*. Conflict between gold-standard and non-gold-standard countries over currency stabilization. President Roosevelt's decisive message, rejecting stabilization. The subsequent increase in economic nationalism.

2. *The Disarmament Impasse*. The MacDonald Plan won support of the United States and a majority of powers. Decision of France, Italy, Great Britain and United States to amend the MacDonald Plan so as to equalize armaments in from five to eight years precipitated Germany's withdrawal from the Disarmament Conference.

3. *Partial Disintegration of League of Nations*. Japan's withdrawal after being censured for aggression in Manchuria. Germany's withdrawal and Italy's demand for revision of the League Covenant and methods. The League's efforts to settle the Leticia and Chaco disputes in South America.

4. *Pan American Conference's Unexpected Success*. The "good-neighbor" policies of President Roosevelt and Secretary of State Hull inaugurated a new era of Pan-American political and economic cooperation.

5. *The Growing Instability in Europe*. Adolf Hitler's triumph in Germany, accompanied by the "liquidation" of all non-Nazi groups, anti-Semitism, and economic reorganization. The sweep of Fascism into other European states. The far-reaching political realignments among the European powers produced by Hitler's accession to power in Germany. Austria's struggle against absorption by Germany, and the Dollfuss dictatorship. Consolidation of the Little Entente to oppose the German drive for treaty revision. Negotiations for a Balkan peace pact and economic union. Mussolini's steps toward reform of the capitalist system in Italy; signing of the Four-Power Pact in Rome; the lessening of Italian-French hostility and Mussolini's growing opposition to Hitler's Austrian policy. The collapse of three Radical Socialist cabinets in France; the growth of unrest in France, marked by taxpayers' demonstrations, strikes, and disorders. Great Britain's noteworthy economic recovery; continuation of the Anglo-Irish tariff war; heavy gains by Labor in British municipal and by-elections. The reaction against radicalism in Spain, causing the downfall of the Azafia Ministry.

6. *Soviet Union*. The triumph of collectivism on the farms. Inauguration of second Five-Year Plan. Trial of British engineers and the British anti-Soviet embargo. Recognition by the United States. Growing friction with Japan. The safeguarding of Soviet western and southern frontiers by a series of non-aggression pacts.

7. *The Far East*. Extension of Japanese hegemony over Eastern Asia by the conquest of Jehol, the demilitarization of North China, and the Tanguku truce. The Nanking government's fifth anti-Communist campaign, interrupted by the Fukien revolt. The Siamese rebellions. Rejection of Hawes-Cutting bill by Philippine Legislature.

8. *Latin America*. War between Bolivia and Paraguay in the Chaco temporarily suspended, following a great Paraguayan victory. Assassination of President Sánchez Cerro of Peru paved way for termination of hostilities with Colombia over Leticia. The Cuban revolutions and the refusal of the United States to intervene. Establish-

PREFACE

ment of a dictatorship in Uruguay by President Terra. Meeting of the constitutional convention in Brazil. Withdrawal of last United States marines from Nicaragua and the negotiation of an agreement for early evacuation of Haiti. Mexico's adoption of Six-Year Plan, with socialism as the goal.

9. *War Debts.* Great Britain, Italy, Czechoslovakia, Latvia, and Lithuania made "token payments" to the United States in place of full war-debt installments. Finland paid in full, while France, Belgium, Poland, and Estonia defaulted. Anglo-American negotiations for a war-debt adjustment proved fruitless.

Indeed, the year 1933 was a strenuous one, but one on which the world can look back with satisfaction as a whole for its achievements, and for the sense of security that the progress already made toward complete recovery in the face of nearly five years of economic blizzard, now assures.

MISS MARY CLAPP, Associate Editor in charge of the department of BIOGRAPHY, reports that the year has taken a heavy mortality toll of eminent men and women. From the 675 obituaries contained in the YEAR BOOK, there may be mentioned:

In the field of *Statesmanship*, Calvin Coolidge, Viscount Grey of Fallodon, Count Apponyi, Daniel Sánchez de Bustamante, Viscount Chelmsford, Ion Duca, King Feisal of Iraq, Georges Leygues, Francisco Macías y Llussa, and Paul Painlevé; in *Literature and Letters*, Augustine Birrell, John Galsworthy, Stefan George, George Moore, the Comtesse de Noailles, Sara Teasdale, and Henry van Dyke; in *Art*, Pierre Carrier-Belleuse, Charles H. Davis, and George Luks; in *Drama and the Stage*, Firmin Gémier, Edward H. Sothorn, and Louise Closser Hale; in *Music*, Robert Kajanus; in *Religion*, Felix Adler, Annie Besant, and the Dalai Lama of Tibet; in *Science*, Leon Calmette, Edmund Fournier d'Albe, Emile Roux, and Sir Arthur Thomson; in *Philosophy*, Irving Babbitt; and in the *Humanities*, James Loeb. Also, in *Exploration*, the Duke of the Abruzzi, and Knud Rasmussen; in *Aeronautics and Aviation*, Herbert J. L. Hinkler, Rear Admiral William A. Moffett, and the Marquis de Pinedo; in *Sport*, James J. Corbett, in *Law*, Thomas Watt Gregory; in *Medicine*, Alfred Hess and Sir Robert Jones; in *Engineering*, Sir Ernest Moir, Maj.-Gen. William M. Black, and Arthur P. Davis, in *Journalism*, Viscount Burnham and Cyrus H. K. Curtis; in *Education*, John Grier Hibben and Anatol Lunacharsky; in *Industry*, Wilhelm Cuno, Edward N. Hurley, and Alexander Legge; in *Finance*, Carl Joseph Melchior and Richard B. Mellon; in *Military Science*, Gen. Sir Arthur Currie and Field Marshal Sir William Robertson; in *Naval Science*, Admiral Sir Henry Campbell; in *Shipping*, Sir John Reeves Ellerman; and in *Civic and Political Reform*, Charles H. Parkhurst and Richard Rogers Bowker.

While Science is frequently blamed for the economic and social ills from which we suffer it is to Science alone that we must turn for their cure. It cannot be stayed in application or research, and one of the tasks that the future faces is the necessity to so modify economic and political systems that the people may enjoy to the full the fruits of scientific endeavor. THE NEW INTERNATIONAL YEAR BOOK's record shows not only what has happened during the year that has passed, but points to what is happening, and also, by deduction from stated facts or premises, what is likely to happen during the years to come. Whether or not the conclusions arrived at through such deductions are warranted may well rest on the axiom, "The thing that hath been, it is that which shall be: and that which is done is that which shall be done."

MR. LOUIS M. HACKER, contributor of articles on ECONOMIC, SOCIAL, and POLITICAL SCIENCE subjects, summed up developments in his fields as follows:

Significant among the events of the year in the fields of economics and governmental action were the legalization of beer and the repeal of the Prohibition Amendment; renewed interest among the States in the Child Labor Amendment; the passage of Minimum Wage Laws by a number of States, and greater Federal preoccupation with unemployment through the creation of the Civilian Conservation Corps, the Civil Works Administration, and Civil Works Service Bureau. The articles on LYNCHING and JEWS show the revival of mass terror in the United States and Germany during the year, those on UNEMPLOYMENT and CHILD LABOR show general improvement of employment conditions throughout the world, and betterment of conditions of work for children in the United States due to operations of industrial codes under the N. R. A. The article on STRIKES AND LOCKOUTS indicates that revival of industrial activity in the United States was accompanied by industrial unrest and labor struggles.

MR. CHARLES E. FUNK, Associate Editor in charge of the MINERAL DEPARTMENT, has reported that in general there was a slight cause for optimism by producers.

Though in most instances the net figures for output were lower than in 1932 or within a few per cent of the 1932 production, these were occasioned rather by the abnormal declines in the early months of the year than by a persistent lessening of activity. Tremendous declines in construction activities affected unfavorably those minerals directly dependent; but with the projects under the National Recovery Administration taking shape and this assured outlet for material of construction, the production of such minerals showed marked gains during the closing months of the year.

The Reader's attention is invited particularly to the Maps to be found distributed throughout this volume. The Economic Map of Asia brings to light for the first time in a work of this kind the distribution of various products over the Continent. Another map unique in character is the chart of World Radio Inter-communication.

It is a pleasure to welcome to the NEW INTERNATIONAL YEAR BOOK's body of specialists, DR. GORDON A. ALLPORT, of Harvard University, who ably presents the year's work in PSYCHOLOGY; DR. WILLIAM FOSTER, Professor of Chemistry at Princeton University, whose articles on CHEMISTRY present, with characteristic clarity and excellence, the strides that have been made throughout the year; and MR. RICHMOND T. ZOECH of the United States Weather Bureau, whose articles on ASTRONOMY, METEOROLOGY, EARTHQUAKES, FLOODS, and SEISMOLOGY cover the events of the year in those sciences.

Appreciative thanks for obligations incurred and courtesies received are offered to the Officers of the various Departments of the United States Government and their allied Bureaus; also, to the Officers of those other Governments who have supplied much information concerning their respective countries; to the Committee of "A Century of Progress" Exposition, Chicago; to MR. WILLIAM P. BANNING, of the American Telephone and Telegraph Company; and to each and every Association, Company, Corporation, or other Institution that has contributed material which will serve to maintain the high degree of accuracy required of this work.

It becomes my pleasant duty to acknowledge here the assiduous labors and painstaking care that have been exercised by the EDITORS and CONTRIBUTORS who have collaborated with me, and my Associate in editorial direction, HELEN READY BIRD, to whose unselfish devotion to an arduous task may be attributed, in no small measure, the merits of this work.

FRANK H. VIZETELLY

EDITOR
FRANK H. VIZETELLY, LITT.D., LL.D.

ASSOCIATE EDITORS AND CONTRIBUTORS

AERONAUTICS; MINERALS

CHARLES EARLE FUNK, C.E.,
ASSOCIATE EDITOR.

AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; COTTON; TOBACCO

HENRY M. STEECE, B.S. (Agr.), A.M.,
SPECIALIST IN AGRONOMY, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

AGRICULTURAL EXTENSION WORK

REUBEN BRIGHAM, B.S. (Agr.),
SENIOR AGRICULTURALIST, IN CHARGE OF VISUAL INSTRUCTION AND EDITORIAL WORK, EXTENSION SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE.

ANTHROPOLOGY (WITH ETHNOLOGY)

LESLIE SPIER, PH.D.,
RESEARCH ASSOCIATE IN ANTHROPOLOGY, YALE UNIVERSITY; EDITOR, *The American Anthropologist*.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

TALBOT F. HAMLIN,
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS

ASTRONOMY; METEOROLOGY; FLOODS; EARTHQUAKES; SEISMOLOGY

RICHMOND T. ZOCH, A.M.,
UNITED STATES WEATHER BUREAU.

AUTOMOBILES

HENRY R. COBLEIGH, M.E.,
MEMBER OF STAFF, NATIONAL AUTOMOBILE CHAMBER OF COMMERCE.

BIOGRAPHY

MARY CLAPP, ASSOCIATE EDITOR.

BOTANY

CHARLES L. POLLARD, A.M.,
THE STATEN ISLAND PUBLIC MUSEUM.

CHEMISTRY

WILLIAM FOSTER, A.M., PH.D.
RUSSELL WELLMAN MOORE PROFESSOR OF CHEMISTRY, PRINCETON UNIVERSITY.

CIVIL ENGINEERING

JAMES K. FINCH, C.E., A.M.,
BENWICK PROFESSOR OF CIVIL ENGINEERING, COLUMBIA UNIVERSITY.

CORRELATION AND CROSS-REFERENCES

HELEN READY BIRD,
ASSOCIATE IN EDITORIAL DIRECTION.

CROP PRODUCTION; UNITED STATES DEPARTMENT OF AGRICULTURE

JOHN I. SCHULTE, B. (Agr.),
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

DAIRYING; LIVESTOCK; WOOL

GEORGE HAINES, B.S., M.S., PH.D.,
SENIOR ANIMAL HUSBANDMAN, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

DRAMA

RALPH W. CAREY,
NEW YORK DRAMATIC CORRESPONDENT, *The Hartford Courant*.

ECONOMIC ENTOMOLOGY; VETERINARY MEDICINE

WILLIAM A. HOOKER, B.Sc., LL.M., D.V.M.,
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

ECONOMIC, SOCIAL, AND POLITICAL SCIENCE SUBJECTS

LOUIS M. HACKER, A.M.,
EDITORIAL STAFF, *Encyclopædia of the Social Sciences*; CO-AUTHOR, *United States Since 1865*.

EDUCATION; UNIVERSITIES

MILO B. HILLEGAS, PH.D., LL.D.,
PROFESSOR OF EDUCATION, TEACHERS COLLEGE, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING

WALTER I. SLICHTER, E.E.,
PROFESSOR OF ELECTRICAL ENGINEERING, COLUMBIA UNIVERSITY.

FERTILIZERS AND SOILS

ROBERT W. TRULLINGER, B.S., C.E., A.E.,
ASSISTANT IN EXPERIMENT STATION ADMINISTRATION, SENIOR AGRICULTURAL ENGINEER, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

FINANCE; BANKING; BUSINESS REVIEW; TAXATION

H. PARKER WILLIS, PH.D.,
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

FIRE PROTECTION

ROBERT S. MOULTON,
NATIONAL FIRE PROTECTION ASSOCIATION.

FORESTRY AND HORTICULTURE

JOSEPH W. WELLINGTON, M.Sc.,
HORTICULTURIST, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

FRENCH LITERATURE

ALBERT SCHINZ, PH.D.,
PROFESSOR OF ROMANIC LANGUAGES AND LITERATURE, UNIVERSITY OF PENNSYLVANIA.

GEOLOGY

WILLIAM M. AGAR, PH.D.,
ASSISTANT PROFESSOR OF GEOLOGY, COLUMBIA UNIVERSITY.

GERMAN LITERATURE

GEORGE N. SHUSTER, A.M.,
MANAGING EDITOR, *The Commonwealth*; AUTHOR, *The Germans*.

ILLUSTRATIONS

KEY TO PRONUNCIATION

ä	as in ale, fate. Also see ø, below.	ð	as in the Spanish Almodovar, pulgada, where it is nearly like th in English then, this.
ä	" " senate, chaotic.	g	" " go, get.
ä	" " glare, care, and as e in there. See ø, below.	g	" " the German Landtag, and ch in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
ä	" " am, at.	h	" j in the Spanish Jijona, g in the Spanish gila; where it is a fricative somewhat resembling the sound of h in English hue or y in yet, but stronger.
ä	" " arm, father.	hw	" wh in which.
ä	" " ant, and final a in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short u (ü).	κ	" ch in the German ich, Albrecht, and g in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of h in hue, or y in yet; or the sound made by beginning to pronounce a k, but not completing the stoppage of the breath. The character κ is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of kh in the word Khan.
æ	" " final, regal, where it is of a neutral or obscure quality.	ñ	" " in sinker, longer.
æ	" " all, fall.	ng	" " sing, long.
æ	" " eve.	n	" " the French bon, Bourbon, and m in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by n, as in the case of São Antão.
æ	" " elate, evade.	sh	" " shine, shut.
æ	" " end, pet. The characters æ, ä, and å are used for ä, ae in German, as in Baedeker, Grafe, Handel, to the values of which they are the nearest English vowel sounds. The sound of Swedish ä is also sometimes indicated by æ, sometimes by å or å.	th	" " thrust, thin.
æ	" " fern, her, and as i in sir. Also for ø, oe, in German, as in Göthe, Goethe, Ortel, Oertel, and for eu and oeu in French, as in Neufchâtel, Crèvecœur; to which it is the nearest English vowel sound.	th	" " then, this.
e	" " agency, judgment, where it is of a neutral or obscure quality, æ.	zh	" z in azure, and s in pleasure.
i	" " ice, quiet.	An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kāz'm (chasm).	
i	" " quiescent.	Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.	
i	" " ill, fit.	When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in THE NEW INTERNATIONAL ENCYCLOPÆDIA and in the NEW STANDARD DICTIONARY.	
o	" " old, sober.		
ö	" " obey, sobriety.		
ö	" " orb, nor.		
ö	" " odd, forest, not.		
o	" " atom, carol, where it has a neutral or obscure quality.		
oi	" " oil, boil, and for eu in German, as in Feuerbach.		
oo	" " food, fool, and as u in rude, rule.		
oo	" " foot, wool.		
ou	" " house, mouse.		
u	" " use, mule.		
ü	" " unite.		
ü	" " cut, but.		
u	" " full, put, or as oo in foot, book. Also for u in German, as in München, Muller, and u in French, as in Buchez, Budé; to which it approximates in English.		
u	" " urn, burn.		
y	" " yet, yield.		
h	" " the Spanish Habana, Córdoba, where it is like a v made with the lips alone, instead of with the teeth and lips.		
ch	" " chair, cheese.		

THE NEW INTERNATIONAL YEAR BOOK

ABBOTT, LAWRENCE FRASER. An American editor, publisher, and writer, died in New York City, Feb. 7, 1933. He was born in Brooklyn, N. Y., June 25, 1859, the son of Lyman Abbott, and was graduated from Amherst College in 1881, later receiving the Litt.D. degree from Bowdoin College and from the University of Vermont. Until 1891, when he succeeded his father as president of the Outlook Co., publishers of the periodical previously known as the *Christian Union*, he was engaged as a reporter on the San Francisco *Chronicle* and as assistant editor of *Outing*. He served as secretary to Theodore Roosevelt on his game-hunting expedition to Africa and tour of Europe after his retirement from the presidency and subsequently edited his *African and European Addresses* (1910). From his *Impressions of Theodore Roosevelt* (1919) and the biographical sketch of the ex-president which he wrote as a foreword to the *Letters of Archie Butt* (1924) he gained the sobriquet of "Roosevelt's Boswell."

Shortly after the death of his father in 1922 Dr. Abbott sold his interest in the *Outlook* but continued to serve as director and contributing editor under his brother, Ernest Hamlin Abbott, who held the position of editor-in-chief from 1923 until the merger of the *Outlook* with the *Independent* in 1928. He also served from 1918 to 1931 as a trustee of the New York Life Insurance Co. and after 1931 as its secretary. Among his other books are *Twelve Great Modernists* (1927) and *The Story of Nylic* (1930).

ABRUZZI, PRINCE LUIGI AMEDEO GIUSEPPE MARIA FERDINANDO FRANCESCO, DUKE OF THE. An Italian explorer and prince of the House of Savoy, died at Abruzzi City, near Mogadiscio, Italian Somaliland, Mar. 18, 1933. He was born in Madrid, Jan. 29, 1873, the third son of Amedeo, Duke of Aosta, then King of Spain. Two weeks after his birth his father abdicated the Spanish throne and retired to Italy. Always a lover of adventure, at the age of 16 he cruised the shores of South America; at 20 he led a punitive expedition against insurrecting natives in Italian Somaliland; at 21 he scaled the Matterhorn; and at 24 was the first white man to reach the summit of Mt. St. Elias in Alaska, 18,092 ft. above sea level. He related the latter incident in *The Ascent of Mt. St. Elias* (1900).

In 1899, with a crew of Italian and Norwegian explorers, on the *Stella Polare*, a 60-ft. whaling vessel, Abruzzi commanded an expedition into the Arctic, determined to achieve, if possible, what Nansen four years earlier had barely failed in—the discovery of the North Pole. After a year of intense hardship the expedition withdrew but not until one of the sledge parties under Capt. Umberto Cagni had penetrated to a latitude of 80° 33', 229.15 statute miles from the Pole and almost 20 nautical miles farther north than any explorer had yet reached. He had, moreover, determined the northern coast of Franz-Josef Land and the non-existence of Petermann Land. He told the story of this expedition in *On the "Polar Star" in the Arctic Sea* (1903).

In 1906 the Duke carried his explorations into central Africa and made the first exhaustive survey of the Ruwenzori range, climbing, measuring and naming the 16 highest peaks and charting the physical characteristics of the region. His report of the expedition was published in *Ruwenzori* (1908). In 1908 rumors of the engagement of the Duke to Miss Katherine Elkins, daughter of Senator Stephen B. Elkins of West Virginia, were widely circulated. His uncle, King Humbert of Italy, and the royal family, resolutely opposed any fulfillment of the engagement, and the Duke remained a bachelor for the rest of his life.

It was presumed that the young duke sought forgetfulness in 1909 by risking his life in a series of mountain-climbing expeditions in the Himalayas, exploring the Baltoro and Godwin-Austen glaciers in the Karakoram Himalayas, and scaling the latter peak to a new record of 24,600 feet. In 1910 he joined the Italian Navy, and a year later, with the rank of captain, commanded a squadron during the war against Turkey. Upon the entry of Italy into the World War in 1915 Abruzzi was appointed commander-in-chief of the Italian Navy, resigning that post in 1917.

After the war the Duke became interested in the colonization of Italian Somaliland and, largely through his own efforts, converted this region into one of the most prosperous of Italy's colonies. In 1932, upon the merger of three of the largest Italian shipping companies into the Italia Line, he was elected president of the enlarged company. For his scientific achievements he received the honorary degree of LL.D. from Harvard University, and in 1930 was elected a member of the Italian Royal Academy.

ACADEMIES IN SOUTH AMERICA. See SPANISH-AMERICAN LITERATURE.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).

The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635, reorganized in 1816. The membership is limited to 40. The list of the Immortals at the beginning of 1933, in order of their election, was as follows: Paul Bourget; Gabriel Hanotaux; Henri Lavedan; Maurice Donnay; Raymond Poincaré; René Doumic; Marcel Prévost; Henri de Régnier; le maréchal Louis Lyautey; Pierre de la Gorce; Henri Bergson; Louis Barthou; Mgr. Alfred Baudrillard; Jules Cambon; Henri Bordeaux; Joseph Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Henri Brémont (q.v.); Edouard Estaunié; Henri Robert; Camille Jullian (q.v.); Georges Lecomte; Émile Picard; Albert Besnard; Louis Bertrand; Auguste de Caumont, duc de la Force; Paul Valéry; Abel Hermant; Émile Mâle; Louis Madelin; Maurice Paléologue; le maréchal Henri Pétain; André Chaulmeix; Gen. Max Weygand; Pierre Benoit; Abel Bonnard; and Lenôtre (L. L. T. Gosselin). At the June meeting François Mauriac, the novelist, was elected to succeed the late Eugène Brieux.

ACADEMY OF ARTS AND LETTERS.

AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters for the purpose of furthering and representing the interests of literature, painting, sculpture, architecture, and music. Its membership is limited to 50 chairs, vacancies caused by death being filled by election from the membership of the Institute.

The membership of the academy as of Nov. 9, 1933, consisted of the following in the order of their election: Robert Underwood Johnson, Edwin Howland Blashfield, George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Owen Wister, Herbert Adams, Augustus Thomas, Cass Gilbert, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Elihu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Archer Milton Huntington, Childe Hassam, Lorado Taft, Newton Booth Tarkington, Charles Dana Gibson, Royal Cortissoz, Henry Hadley, Charles Downer Hazen, George Pierce Baker, Wilbur L. Cross, Herman A. MacNeil, John Russell Pope, Edwin Arlington Robinson, James Earle Fraser, John Huston Finley, William Mitchell Kendall, Edwin Markham, Robert Frost, James Truslow Adams, Edith Wharton, George Grey Barnard, Charles Martin Loeffler, William Lyon Phelps, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, and Paul Manship.

At the annual meeting on Nov. 9, 1933, the following new members were elected: Cecilia Beaux, Eugene O'Neill, William James Henderson, and Henry Dwight Sedgwick. There were presented to Lawrence Tibbett, the Metropolitan Opera Company's baritone, the academy's medal for good diction on the stage and to James Wallington of the National Broadcasting Company its medal for good diction on the radio. Prof. Chauncey Brewster Tinker of Yale University, a member of the institute, made the fourteenth address on the Evangeline Wilbour Blashfield Foundation, entitled "Stedman as a Poet." This address was in celebration of the 100th anniversary of the birth of Edmund Clarence Stedman, one of the founders of the institute in 1898, its third presi-

dent, and one of the original seven members chosen to constitute the academy. A Stedman Centenary Exhibition was also opened.

The officers of the academy in 1933 were: President, Nicholas Murray Butler; chancellor and treasurer, Wilbur L. Cross; secretary, Robert Underwood Johnson; directors, Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, Cass Gilbert, Archer Milton Huntington. Administrative offices are at 633 West 155th Street, New York City.

ACADEMY OF INTERNATIONAL LAW.

ACCIDENTS. See RAILWAY ACCIDENTS; SAFETY AT SEA; WORKMEN'S COMPENSATION.

ACETAMIDE. See CHEMISTRY, INDUSTRIAL OR APPLIED, under *A Powerful Solvent*.

ADAMS, THOMAS SEWALL. An American economist and educator, died in New Haven, Conn., Feb. 8, 1933. Born in Baltimore, Md., Dec. 29, 1873, he attended the Baltimore City College and was graduated from Johns Hopkins University with the A.B. degree in 1896 and the Ph.D. degree in 1899. After serving as assistant to the Treasurer of Puerto Rico, he accepted in 1901 the position of associate professor of political economy at the University of Wisconsin, becoming full professor in 1908. While at Wisconsin he served also as Tax Commissioner of the State during 1911-15. In 1916 he was called to the chair of political economy at Yale University.

Appointed special adviser to the Federal Treasury Department in 1917, Adams rendered an indispensable service to Congress in his analyses of proposed measures of taxation. He was elected president of the National Tax Association in 1922 and of the American Economic Association in 1927, and after 1929 was a member of the fiscal committee of the League of Nations. Among his works were *Taxation in Maryland* (1900); *Labor Problems* (with Helen L. Sumner, 1905); *Mortgage Taxation in Wisconsin and Neighboring States* (1907); and *Outlines of Economics* (with Richard T. Ely, 1908).

ADELPHI COLLEGE. A nonsectarian college of liberal arts and sciences for women, located in Garden City, New York, incorporated in 1896. Adelphi was located in Brooklyn, New York, until the autumn of 1929 when it was transferred to its new home in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1933 was 456 students. The faculty numbered 44. The endowment was \$892,799, while the income for 1932-33 was \$206,935. The library contained 33,220 volumes. President, Frank Dickinson Blodgett, LL.D.

ADEN, ä'dën or ä'dën. A fortified British seaport and peninsula near the southern entrance of the Red Sea about 100 miles east of the Strait of Rab-el-Mandeb. Area of the peninsula 75 square miles; including the Aden Protectorate and the Hadramaut (under loose British control) 42,000 square miles; Perim (an island in the Strait of Rab-el-Mandeb) 5 square miles. Population of Aden and Perim, in 1931, 48,338. Aden is primarily a transshipment port and produces little itself—its chief industries are the manufacture of salt, cigarettes, and dhow building. It is the chief commercial centre for the Arabian peninsula and the chief commodities of trade are coal, cotton piece goods, fuel oil, gasoline, grain, hides and skins, tobacco, and pro-

visions. For 1931-32 the total imports amounted to 56,294,814 rupees; total exports, 37,662,839 rupees; total government receipts amounted to 979,642 rupees; total expenditure was 516,203 rupees (the rupee averaged \$0.2635 for 1932). Merchant vessels entering the port of Aden in 1931-32 numbered 1483 and aggregated 5,813,623 tons; at Perim 298 vessels entered.

Aden is a separate province under a Chief Commissioner who is under the direct control of the government of India. The Aden Protectorate, which is not administered directly, is controlled for the Colonial Office by the Resident and Commander-in-Chief of Aden. Chief Commissioner and Resident and Commander-in-Chief in 1933, Lieut.-Col. B. R. Reilly.

ADJAR AUTONOMOUS REPUBLIC. See TRANSCAUCASIAN SOCIALIST FEDERATED SOVIET REPUBLIC.

ADLER, FELIX. An American educator and reformer, died in New York City, Apr. 24, 1933. He was born at Alzey, Germany, Aug. 13, 1851, and at the age of six was brought to the United States, his father, Dr. Samuel Adler, having been called to the ministry of Temple Emanu-El in New York City. After graduating from Columbia College in 1870, he studied philosophy and economics at the Universities of Berlin and Heidelberg, receiving the Ph.D. degree from the latter in 1873. On his return to the United States, however, he forewent the opportunity to succeed his father in the rabbinate, accepting instead the professorship of Hebrew and Oriental literature at Cornell University. During this period he was formulating the tenets of the Society for Ethical Culture, which he founded on his return to New York City in 1876 and with which his name was thereafter identified as senior leader. The purpose of this non-sectarian movement was to promote the moral development of the individual and society by teaching that the ethical factor is supreme above all other factors of life, that the authority of the moral law, while fundamental to, is not dependent upon religious beliefs or philosophical theories, and that all human beings are morally equal in their responsibility for the creation of an ideal society. The movement later spread throughout the United States, societies being established in Chicago, Philadelphia, St. Louis, San Francisco, and other leading cities. It also met with special response in England, Germany, Austria, Italy, and Japan.

In 1902 Dr. Adler was called to the chair of social and political ethics, created especially for him at Columbia University. He was also Roosevelt exchange professor at the University of Berlin for the year 1908-09. Setting forth by personal example his belief in the individual's responsibility to society, he took a conspicuous part in the agitation against child labor, white slavery, tenement congestion, and other evils, and in 1904 became first chairman of the National Child Labor Committee. His principal works were *Creed and Deed* (1877); *The Ethics of the Political Situation* (1884); *The Moral Instruction of Children* (1892); *Marriage and Divorce* (1905); *Life and Destiny* (1905); *Essentials of Spirituality* (1905); *Religion of Duty* (1905); *The World Crisis and Its Meaning* (1915); and *An Ethical Philosophy of Life* (1918). In 1923 he delivered the Hibbert lectures at Oxford, published later in that year as *The Reconstruction of the Spiritual Ideal*. He also served as a mem-

ber of the editorial board of the *International Journal of Ethics*.

ADMIRALTY ISLANDS. See NEW GUINEA.

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. An organization founded in 1926 to serve as a national clearing house of information concerning adult education activities. See THE NEW INTERNATIONAL YEAR BOOK, 1932, for further details of aims and objects.

Discussions initiated by the Association in 1930 led to the conclusion that many central problems of adult education revolved about some solution of occupational difficulties. During 1933, two major enterprises were addressed toward this end. The first was the Adjustment Service of New York, sponsored by the Association and financed by a grant made by the Carnegie Corporation of New York, through allocation, to the Emergency Unemployment Relief Committee with supplementary services provided by the Committee's Emergency Work Bureau. The primary purpose of the Adjustment Service was to assist the individual in discovering his peculiar abilities and limitations, to point out reasons for failure to the maladjusted, and to assist in the formulation of sound programmes for re-education and recreation. Each individual was assigned to a counselor, who might requisition the assistance of experts for medical and psychiatric examination and for administering psychological tests. The more complex and puzzling cases were considered by a board of experts. It was estimated that about 14,000 individuals would have received the benefit of the Service before its termination in the spring of 1934.

A second attack on the problem of occupational difficulties led to the formation of the National Occupational Conference, financed by grants made to the Association for this purpose by the Carnegie Corporation of New York. The National Occupational Conference was intended to serve as a clearing house for occupational information, its central programme being threefold: to gather information, to distribute information, and to stimulate research. A programme of publication was undertaken with the issuance of *Occupations*, merged at the outset with the *Vocational Guidance Magazine*, the official organ of the National Vocational Guidance Association. The membership of the conference consisted of 67 men and women engaged in central fields of general and vocational education, personnel administration in government and industry, etc. Franklin J. Keller was appointed director. Headquarters offices are at 522 Fifth Avenue, New York City.

The first attempt at a community-wide experiment in adult education, based upon an entire school system and conducted by school authorities, was inaugurated in 1933 at Des Moines, Iowa. The plan contemplated the establishment of public forums for a five-year period. Grants were made by the Carnegie Corporation of New York upon recommendation of the Association. Forums were provided in all sections of the city for the discussion of current social, political, and economic problems. There were no textbooks, fees, enrollments, assignments, tests. The leaders were men of recognized scholarship, with a record of active participation in public affairs. They were expected to present information on all sides of a question, define the issues as clearly as possible, and guide the discussion so that opposing points of view might be accorded free expression.

Two studies were completed and published by

the Association in 1933: *Rural Adult Education* by Benson Y. Landis and John D. Willard, the first attempt to analyze and to set down in cross section those educational activities open to rural residents of this country; and *University Teaching by Mail* by W. S. Bittner and H. F. Mallory, a careful review and analysis of correspondence instruction as conducted by American universities.

The Association's eighth annual meeting was held at Amherst, Mass., in May, 1933. The following officers were elected: Dorothy Canfield Fisher, president; James E. Russell, chairman; Charles A. Beard, W. W. Bishop, Harvey N. Davis, John Hope, James A. Moyer, William A. Neilson, and George E. Vincent, vice-presidents; Jennie M. Flexner, secretary; Chauncey J. Hamlin, Treasurer. Headquarters are at 60 East Forty-Second Street, New York City.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. An organization founded in 1848 to advance science, to give a stronger and more general impulse and systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. On Sept. 30, 1933, its membership included 18,549 cooperating individuals. As a general association of the numerous American societies for the advancement of the special sciences, it consisted of 140 autonomous and independent associated scientific societies, of which 102 were officially affiliated with the association, 28 being local academies of science.

By invitation of Harvard University and the Massachusetts Institute of Technology the association's ninety-third meeting was held in Boston, Dec. 27, 1933, to Jan. 2, 1934, with an attendance of about 3000 scientists from all parts of the United States and Canada. The address of the retiring president, Dr. John Jacob Abel, professor of pharmacology at the Johns Hopkins University, was entitled "Poisons and Disease." William Morris Davis delivered the second Hector Maiben lecture on "The Faith of Reverent Science," while Henry Fairfield Osborn as Sedgwick Memorial lecturer spoke on "Aristogenesis, the Creative Principle in the Origin of Species." At the general sessions the Rumford Medal for distinguished research in physics was presented jointly by the association and the American Academy of Arts and Sciences to Harlow Shapley, director of the Harvard Observatory. Dr. Shapley addressed the meeting on "The Anatomy of a Disordered Universe."

More than 1500 papers were presented at the meetings of the association's various sections which represent the main current subdivisions of science: mathematics, physics, chemistry, astronomy, geology and geography, zoological sciences, botanical sciences, anthropology, psychology, social and economic sciences, historical and philological sciences, engineering, medical sciences, agriculture, and education. The eleventh prize of \$1000 for a paper read at the meeting describing a noteworthy contribution to science was awarded to R. L. Kahn of the University of Michigan for "Tissue Reactions in Immunity." There was also held a special conference of the Committee on the Place of Science in Education, at which the relations between teaching and the advancement of science were discussed.

Meeting with the association were 33 scientific organizations, of which the more important were the American Society of Zoologists, Botanical Society of America, American Society of Natural-

ists, American Society of Agronomy, Entomological Society of America, American Physical Society, American Astronomical Society, American Mathematical Society. The science exhibition was well developed, with exhibits by commercial firms, individuals, scientific organizations, educational institutions, and government bureaus.

The national summer meeting in 1933 was held in Chicago June 19 to 30. The next winter meeting was to be held in Pittsburgh, Pa., Dec. 27, 1934, to Jan. 2, 1935. There were also held under the auspices of the association the usual annual and other meetings of the Pacific division, which includes the Pacific States, Alaska, and the Hawaiian Islands, and the Southwestern division, which includes Arizona, New Mexico, Colorado, western Texas, and northern Mexico.

The official organ of the association is a weekly journal, *Science*. In addition the association issues the *Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science, and publishes at four-year intervals a volume of *Summarized Proceedings*, including a directory of members. The permanent endowment of the association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1933, to about \$203,000.

The president of the association for 1933 was Henry Norris Russell, director of the Princeton University observatory, who assumed office at the opening session of the Boston meeting. The president-elect for 1934 was Edward L. Thorndike, professor of educational psychology at Teachers College, Columbia University. The other officers were: Permanent secretary, Henry B. Ward; general secretary, Burton E. Livingston; and treasurer, John L. Wirt. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

ADVENT CHRISTIAN CHURCH. See ADVENTISTS.

ADVENTISTS. In America the Advent Movement owed its origin to William Miller (1782-1849), a religious leader (q.v. *NEW INTERNATIONAL ENCYCLOPEDIA*, vol. xv), who from 1831 taught not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. In England it began under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving. For the early history of the Advent Movement see *THE NEW INTERNATIONAL YEAR BOOK* for 1932 and *THE NEW INTERNATIONAL ENCYCLOPEDIA*, vol. i, p. 158 ff.

ADVENT CHRISTIAN CHURCH. This church holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. Statistics reported at the biennial general conference held at Plainville, Conn., in June, 1932, showed 43 conferences, 469 churches, 485 ordained ministers, 81 licensed ministers, and 27,490 church members. There were also 332 Sunday schools with 19,102 members, 93 senior Young People's Societies of Loyal Workers with 2181 members, and 19 junior Young People's Societies with 325 members. The denomination maintains Aurora College at Aurora, Ill., and the New England School of Theology in Boston. Among its philanthropic institutions are the American Advent Christian Home and Orphanage at Dowling Park, Fla., and the Vernon Home for ministers and missionaries at South Vernon, Mass. Periodicals include *The World's Crisis* (Boston), *Messiah's Advocate* (Oakland, Calif.), and *Present*

Truth Messenger (Live Oak, Fla.). The officers in 1933 were Irving F. Barnes, D.D., president; T. P. Stevens, Burr A. L. Bixler, Lee E. Baker, H. J. Wilson, vice-presidents; C. H. Hewitt, secretary, and F. C. Webster, treasurer. Headquarters of the general conference are at 160 Warren Street, Boston, Mass.

SEVENTH-DAY ADVENTISTS. This denomination, which is the largest of the Adventist group, embraces nine union conferences in the United States and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, although under the general supervision of the conference. The statistical report of the denomination for 1932 indicated 2285 churches in the North American division, 981 ordained ministers, and 135,837 church members; Sabbath schools which numbered 2857 had a membership of 134,278.

The foreign divisions, including the Australasian, Central European, Chinese, Far Eastern, Inter-American, Northern European, Southern African, South American, Southern Asia, Southern European, and Union of Soviet Socialist Republics divisions, consisted of 5037 churches, 1194 ordained ministers, 226,264 church members, and 8283 Sabbath schools with an enrollment of 296,840. Throughout the world there was an increase in membership of 26,055 over 1931. The work was conducted in 275 countries and islands by 70 union conferences, 144 local conferences, and 289 mission field organizations, employing 20,715 evangelistic and institutional laborers.

The movement maintains in the United States and Canada 107 educational institutions, which in 1932 had an enrollment of 13,537 students. There are also maintained in foreign countries 97 educational institutions with an enrollment of 10,019 students. The denomination has 17 publishing houses in North America and 51 in other countries. During 1932 denominational literature was issued in 157 languages, and evangelistic work was conducted in 275 countries and islands where there were used, both printed and orally, 485 languages and dialects. Total contributions from all sources amounted to \$5,876,962 for the North American division, and \$3,380,

074 for the other divisions. The headquarters of the General Conference of Seventh-day Adventists are at Takoma Park, Washington, D. C.

AERIAL PHOTOGRAPHY. See **PHOTOGRAPHY**.

AERONAUTICS. The year 1933 witnessed a further approach to the stabilization of aeronautics upon a commercial basis. Whereas heretofore the average man has generally regarded all aircraft as a valuable ally in times of war or as playthings for the foolhardy in times of peace, it has been gradually forced upon his conservatism that transport by air is now scarcely more risky than transport upon the highway. Just as the automobile eventually emerged from the hectic days of "stunt" performance and death-dealing speed contests of thirty years ago, so is aviation taking a place as a normal agency of transportation. The outstanding spectacular flights of the year—the armada of Italian planes from Rome to Chicago and return, Wiley Post's circumnavigation of the globe, the Lindbergh reconnaissance circle of the Atlantic, the U. S. Navy squadron flight from Norfolk, Va., to Panama, thence to San Diego, Calif.—all practically without discordant incident, contributed heavily toward increased confidence in the reliability of aerial navigation.

The first six months of the year showed several rays of encouragement to American transport officials. Despite a falling off in the number of passengers and a 16 per cent reduction in the volume of mail, as compared with the first six months of the previous year, in combined domestic and foreign operation, the volume of express business climbed about 60 per cent for the same comparative period, or from 712,638 lb., January-June, 1932, to 1,055,876 lb., January-June, 1933. Furthermore, though the number of passengers decreased in these comparative periods from 248,954 in 1932 to 235,139 in 1933, the length of the average journey was increased by more than 27 per cent, and by more than 14 per cent over the period July-December, 1932. In both domestic and foreign air-mail carried by American operators the volume in the comparative first six months of each year showed a great reduction in 1933, dropping from a grand total of 4,342,507 lb. during the period January-June, 1932, to 3,648,217 lb., January-June, 1933, and

SCHEDULED AMERICAN AIR-TRANSPORT OPERATIONS STATISTICS FOR 1932 AND 1933

	DOMESTIC			
	January-June 1933	July-December 1932	January-June 1933	July-December 1933
Miles flown	22,204,295	23,402,059	23,012,748	25,758,810

Mail payments ..	\$12,643,704.27	\$18,590,616.89	\$12,758,073.21	\$10,655,617.21
Passenger-miles flown	63,529,588	83,023,049	76,642,393	122,157,686

only a slight improvement over the volume, 3,566,216 lb. carried in the period July-December, 1932.

Although air-travel is necessarily seasonal to a large extent in the United States, and the summer and autumn months can be expected to show heavier travel than in the early months, the closing six months of the year were beyond the expectations of careful prognostications. Travel to the Century of Progress Exposition at Chicago by air was greater than anticipated. This in turn encouraged greater use of this medium of transportation. The number of passengers carried by scheduled operators in continental United States during June reached 59,048 as compared with 38,543 in May, and was increased to 65,181 during August, beginning to show a seasonal decline during September. Detailed results of American-operated airlines with domestic and foreign extensions by six-month periods for the year 1933 as compared with the preceding year, according to the survey made by the Aëronautics Branch of the U. S. Department of Commerce, are shown in the table on page 5.

An important factor that tended toward an increase in passenger travel during the year was the attention given to physical comfort. Planes and engines had been so improved as to permit cruising speeds of greater than 150 m.p.h., and by the middle of the year scheduled trans-continental flights in twenty-one hours had been regularly achieved. The new planes operated by the leading transport companies indicated that speed was not the only desideratum. A liberal use of sound-deadening insulation, the adoption of three-blade propellers, and scientific arrangement of exhaust stacks, each contributed to reducing noise so successfully that conversation between passengers did not require raising the voice. The problems of temperature and ventilation were also solved. Safety in operation was maintained at a high level, fatalities among passengers during the year amounting to less than one in each 70,000 passengers carried.

A feature of interest in commercial transport during the year was the consolidation of groups of independent companies. Whereas at the beginning of the year, thirty-seven companies were operating scheduled services with domestic or foreign routes, by the end of the year, mergers had reduced the total of such companies to twenty-eight; although the mileage of American-operated routes, reduced by the elimination of competition, showed little loss by the end of the year. The following summary from *Air Commerce Bulletin*, covers the status of this transportation industry on Jan. 1, 1934.

EUROPEAN AIR COMMERCE. Competing with American mail, passenger, and express services to South American points, the most outstanding development of the year has been the preparation by Germany for direct service, especially to Rio de Janeiro. During the year the dirigible *Graf Zeppelin* continued its scheduled flights from Friedrichshafen to Pernambuco, with one side trip thence to Chicago; but to supplement this service, the *S.S. Westfalen* was equipped with landing and catapult facilities and was anchored in the South Atlantic at a point midway between the African and South American coasts. Experiments were conducted in the practical use of the steamer as an airdrome, but no regular service had been inaugurated by the close of the year. In a trial flight in November, the flying

boat *Monsoon* of the Lufthansa Lines, starting from British Gambia reached the steamship in 6 hr. 15 minutes. Alighting on the water it was attached to the canvas "train" which is dragged behind the steamer, and was hauled on deck. On the following day the *Monsoon* was shot by catapult from the deck of the steamer and completed its flight to Natal, Brazil. The total flying time was 15 hr. and five minutes. The announced intention by officials of the company is that service is to be limited to the carrying of mail. By this route Berlin is about 6700 miles from Rio de Janeiro, and mail service is reduced to five days.

British enterprise during the year has resulted in the extension of scheduled lines to Calcutta, India, incidental to an anticipated service in 1934 to Australia by way of Singapore. Reconnaissance surveys were made during the year for a new route extending from Lake Victoria down the east coast of Africa to Cape Town to supplement

SUMMARY OF UNITED STATES AIR TRANSPORT OPERATIONS

Miles of American-operated air transport routes.	
Domestic	27,812
Foreign	19,875
Total	47,687
Miles in operation with United States mail—	
Domestic	24,804
Foreign	19,861
Total	44,665
Miles in operation with passengers—	
Domestic	27,526

* Two companies operated both domestic and foreign services.

the present direct route from Cairo. Within the empire and on the Continent, the handling of mail, express, and passengers showed great increase. In mid-year the announcement was made that the total of such business had almost doubled in 1932 over the previous year.

CONSTRUCTION. The Collier Trophy for 1932 was presented to Glenn L. Martin by President Roosevelt on May 31, "for the development of an outstanding bi-engined, highspeed, weight-carrying airplane." The citation accompanying the award read further: "This airplane by reason of its high speed and ability to carry heavy loads, together with its rugged construction, high performance and ease of control establishes a new standard for airplanes of this class."

The first notable development for the year, in the field of transport planes, was the multi-engined Boeing low-winged monoplane. Twenty-one of a fleet of sixty were placed in transcontinental service about the middle of the year. The cruising speed of these 10-passenger planes is 165 m.p.h., with a top speed of 182 miles and a low landing speed of 55 m.p.h. Each plane is driven by two Wasp engines of 550 hp., each mounted in the leading edges of the wings. Sound-proofing, air-conditioning, and other conveniences for passengers were further features. The Curtiss-Wright *Condor*, a biplane carrying two 700-horse power Wright engines, was another type of transport placed in service during the year. These planes, accommodating fifteen passengers and built to provide for their comfort, have cruising ranges of 145 m.p.h., with a top speed of 170 miles. A third transport plane placed in service during the year was the Douglas *Airliner*, a low-wing cantilever monoplane, powered with two Wright Cyclone engines each developing 710 h.p. Cruising speed at 8000 ft., using 62.5 per cent power, is 177 m.p.h., and maximum speed at that elevation is 210 m.p.h.; landing speed, 60 miles.

In Europe, the outstanding development in transport planes during the year was the Fokker *F.XX*, produced in Holland. It is a tri-motored cantilever monoplane, designed for twelve passengers. The three Wright Cyclone engines, each developing 640 hp., give the plane a maximum speed of 186 m.p.h., and a cruising speed of 154 miles.

PRIVATE FLYING. The use of the airplane in other than commercial fields progressed favorably during the year, despite depleted incomes. Aviation schools throughout the country steadily turned out a mounting list of pilots who were absorbed to a considerable extent in private operations. Statistics are not available covering the operation of private planes, but they have become permanent adjuncts in the transportation needs of many people of wealth; have found great utility in such industries as logging, gold mining, ranching, and are employed in all parts of the world as the ideal solution of immediate transportation where older methods were long, difficult, or otherwise impracticable.

NOTABLE FLIGHTS. It is encouraging that flights having no object other than spectacular feats were less numerous during the year than in previous years. Some there were, and if the participants reached their goals successfully, they were duly acclaimed as heroes of the moment; if not, their follies were usually buried with them. Probably the most soundly conceived of the outstanding flights of the year were those of the Italian armada, the U. S. Navy squadron flight to Panama,

the Lindbergh flight, the Kingsford-Smith and the Ulm flights from England to Australia, and the Wiley Post round-the-world flight. These, and other memorable flights are given in the following chronological summary.

January 12. Twenty-two planes carrying 59 men of the Second Brigade, U. S. Marine Corps, completed a 2500-mile flight from Managua, Nicaragua, to Anacostia, Md.

January 16 Jean Mermoz, French aviator, flew the South Atlantic from St. Louis, Senegal, Africa, to Natal, Brazil, with a load of 31,305 lbs., including six passengers, in 14 hours. His trip, begun on January 12 at Istres, France, and concluded on January 22, at Buenos Aires, occupied a flying time of 54 hours, 33 minutes, and was made in a Coudinet tri-motored monoplane. (See entry for May 15)

February 8. O. R. Gayford and G. E. Nicholetts, of the British Air Force, completed a non-stop flight of 5341 miles from Cranwell, England, to Walvis Bay, South West Africa, in 57 hours, 25 minutes, beating the distance record previously held by Russell Boardman and John Polando by 328 miles

February 9 Capt. James A. Mollison, British flier, flew his Puss Moth monoplane from Senegal, Africa, to Natal, Brazil. Later he flew to Buenos Aires, completing a flight from England in seven days elapsed time.

April 3. Two planes carrying the Marquess of Douglas and Clydesdale, Col L. V. S. Blacker, D. F. McIntyre, and S. R. Bonnett flew over Mt. Everest, taking photographs and studying its impressive height. A similar trip over Mt. Kanchenjunga was made on the following day.

April 10. Fernando Rein Loring, Spanish aviator, completed a solo flight from Madrid to the Philippine Islands, begun on March 18

April 16 Maryse Hiltze, French aviator, completed a flight from Paris to Tokio. On May 14 he returned to Paris, with a 25,000-mile round-trip to his credit, having made the solo flight in a Farman monoplane.

May 8 Stanislaus Skarzynski, of Poland, flew from San Luis, Senegal, to Maccio, Brazil, 2140 miles, in 17 hours, 50 minutes, in a Gipsy Moth monoplane

May 15. Jean Mermoz, with five passengers, flew from Natal, Brazil, to Dakar, French West Africa, in the Coudinet monoplane used in his westward flight of January 16, he completed the round trip, arriving in Paris, May 21.

June 3 James J. Mattern, American, made a record flight from Floyd Bennett Field, N. Y., to Moscow, a distance of 4920 miles in 31 hours, 49 minutes, in an attempted round-the-world solo flight, crashed on June 14 near Anadyr, Siberia. The aviator was found safe on July 5. He was later taken to Nome, Alaska, in a Russian plane, and was thence brought by stages to New York, arriving July 29. On his transatlantic flight he covered the first hop, New York to southern Norway, a distance of 3670 miles, in 24 hours.

June 11. Mariano Barberan and Joaquin Collar, of the Spanish Army, completed a forty-hour non-stop flight in a Breguet XIX from Seville, Spain, to Camaguey, Cuba, a distance of 4906 miles, about 4500 of which were over water.

June 12 In exactly 24 hours, J. Errol Boyd, Robert G. Lyon, and H. P. Davis, in the rebuilt Bellanca monoplane, *Columbia*, made a non-stop flight from Floyd Bennett Field, New York, to St. Marc, Haiti, a distance of 2470 miles. Boyd and Lyon made a return trip to Washington in 23 hours, arriving July 6.

July 1. General Italo Balbo, leading a command of 24 planes of the Italian Army, started from Orbetello, Italy, on a flight to Chicago, Ill., where they arrived on July 15. Fuller description of the flight is given later in this article

July 9. Col. and Mrs. C. A. Lindbergh started on a survey transatlantic expedition from College Point, N. Y. See separate heading below.

July 15. Wiley Post started from Floyd Bennett Field, on a round-the-world flight. See separate heading below.

July 17. Stephen Darius and Stanley Girenas, Lithuanians, started from Brooklyn on a non-stop flight to Lithuania. Presumably storm-harassed and out of fuel, they crashed and were killed 400 miles from their destination.

July 22. James A. Mollison, accompanied by his wife, Amy Johnson Mollison, started a west-bound transatlantic non-stop flight from Wales to New York. In attempting an emergency landing at Stratford, Conn., their de Havilland Dragon Moth was wrecked in a marsh, with slight injuries to the fliers.

August 5 Lieuts. Paul Codos and Maurice Rossi, French aviators, started from Floyd Bennett Field and made a non-stop flight in their Bleriot monoplane of 5656 miles, landing 56 hours later near Beirut, Syria.

September 8. Six twin-motored seaplanes comprising Squadron 6-F of the U. S. Navy completed a non-stop formation flight of 2059 miles from Norfolk, Va., to Coco Solo, Canal Zone. The flight, except for one trailing plane, was made in 24 hours, 55 minutes, and is the longest non-stop formation flight on record. On October 9, five of the planes arrived at San Diego, after a one-stop flight from the Canal Zone, the stop being at Acapulco, Mex., where the sixth plane had been forced to abandon the trip.

October 11. Wing-Commander Sir Charles Kingsford-Smith completed a record-breaking solo flight in a Percival Gull monoplane from Lympe Airfield, England, to Wyndham, Western Australia, in an elapsed time of 7 days, 4 hours, 50 minutes, lopping more than 40 hours from the previous record established by O. W. A. Scott in 1932.

October 20. Charles T. P. Ulm, Australian aviator, with two assistant pilots and a navigator, broke the record established a week earlier by Kingsford-Smith, flying from England to Derby, Western Australia, in six days, 17 hours, 56 minutes. They flew a triple-motored Avro-10, with Wright-Whirlwind motors.

November 8. A French military squadron of 30 planes started a mass flight under Gen. Victor Vuillemin to French Africa. After a 16,000-mile flight, visiting all of the French possessions in Africa, 28 of the planes returned to their base on December 18, having lost one plane in a crash and another by engine trouble.

ITALIAN ARMADA. On July 1 a peaceful armada of twenty-five Savoia Marchetti twin-motored seaplanes of the Italian army, carrying 96 men, under the command of General Italo Balbo, left Orbetello, Italy bound for Chicago. The first hop of 870 miles over the Alps was completed without incident, but on landing at Amsterdam one of the planes capsized. This was the only accident to mar the entire expedition, for the commander took no unnecessary chances. The balance of the journey was made in the following stages: Amsterdam to Londonderry, 630 miles; Londonderry to Reykjavik, 930 miles; Reykjavik to Labrador, a flight of 1500 miles in 12 hours, 28 minutes; Labrador to Shediak, N. B., 800 miles; Shediak to Montreal, 500 miles, and Montreal to Chicago, 870 miles, arriving on July 15, a total distance of 6100 miles in a flying time of 47 hours and 52 minutes. On July 19 the armada flew to New York, and six days later flew to Shediak, where they were delayed by bad weather. Changing plans for returning as they had come, on August 8 the armada took off for the Azores, 1200 miles; thence 760 miles to Lisbon, and 1160 miles to Rome, where they arrived August 14, after a total trip of about 12,000 miles in 45 days elapsed time.

GLOBE-CIRCLING FLIGHT. Wiley Post, who with Harold Gatty, had circled the globe in 8 days, 15 hours, 51 minutes in 1931, set off on July 15 for a solo trip over the same route and in the same plane, a Wasp-powered Lockheed Vega. Starting from Floyd Bennett Field, N. Y., his first stop was made 25 hours and 45 minutes later at Berlin, a distance of 3942 miles. His several hops thereafter were: Koenigsberg, 340 miles; Moscow, 651 miles; Novosibirsk, 1579 miles; Irkutsk, 1055 miles; Rukhlovo, 750 miles; Khabarovsk, 650 miles; Flat, Alaska, 2800 miles; Fairbanks, 375 miles; Edmonton, 1450 miles; New York, 2004 miles; a total distance of 15,596 miles, in a flying time of 115 hours, 36 minutes, 30 seconds. The elapsed time was 7 days, 18 hours, 49½ minutes, beating the record established by himself and Gatty by 21 hours, 1½ minutes. The flyer utilized to great advantage the automatic pilot, a gyroscopic stabilizer connected to ailerons and rudder, for holding the plane on a true course while he rested.

LINDBERGH SURVEY. Because of his dramatic and unheralded solo flight to Paris six years ago, because of his modest behavior in the acclaim

that followed, because of his romantic courtship of the daughter of one of America's wealthiest men prominent in public life, because of their joint interest and enthusiasm over aviation and their many joint expeditions, and because of the tragedy attending the death of their first son, any expedition embarked upon by Colonel Lindbergh and his wife, Anne Morrow Lindbergh, no matter how humdrum, is lifted into eminence. But when they embark upon an exploratory survey with the expressed object of determining a feasible route for scheduled transport operation between the United States and Europe, the importance of the survey lifts it into eminence, regardless of the actors engaged upon it. Furthermore, Colonel Lindbergh has an established reputation as a safe and sure pilot; taking his wife upon a survey goes tremendously far toward establishing public confidence in the safety of the route that may be determined.

From the viewpoint of peril, their expedition, a circumnavigation of the Atlantic Ocean, was without adventure. The journey itself, involving some five months in covering approximately 30,000 miles, was leisurely, affording ample time at every stop for studying possible sites for stations. Much time was spent in Greenland, and, as the accompanying map indicates, the exploratory trips showed great thoroughness. The expedition started from New York on July 9, with Mrs. Lindbergh operating the radio and acting as navigator. The map shows the successive stops and the distances between stops. The flight into Russia was not connected with the survey. The longest hop of the entire expedition was 1834 miles from Dakar, Senegal, to Natal, Brazil, on December 6. On the northward trip home, instead of following the mapped airway from Para, Brazil, the Colonel headed westward up the Amazon River to Manaus, thence over jungles north to Port of Spain, eventually reaching New York on December 19.

The plane, a Lockheed Sirius monoplane fitted with pontoons, and powered with a Wight Cyclone 715-horsepower engine, was the same plane used by Colonel and Mrs. Lindbergh in their expedition in 1931 from Washington to China, via Alaska, Siberia, and Japan. Shortly after the conclusion of Atlantic circumnavigation it was announced that the plane with every part of the equipment that the flyers had taken, except their personal apparel, had been presented to the American Museum of Natural History, New York, where, early in 1934, it had been placed on exhibition in the Hall of Ocean Life.

AIR RACES. The first of the air races of the season was the fifth annual All-American at Miami, Fla., January 5-7. The winners of the leading events were: Free-for-all race, James Wedell with a speed of 205.295 m.p.h.; Texaco Trophy free-for-all, Eric Wood; Curtiss Trophy, Alton Sherman; Colonel Green Cup, Roy Liggett; Florida Year-Round Clubs Handicap, J. H. Crossman; Women's Race, Betty Lund.

The first event of the National Air Races, held in Los Angeles, July 1-4, was the Bendix Transcontinental Speed Dash. In this event, flying east to west, Roscoe Turner in his Wedell-Williams racer, powered with a supercharged Wasp Senior engine lowered the record from New York to Los Angeles to 11 hours and 30 minutes, making an average speed of 214.78 m.p.h., and later (October 16) being awarded the Harmon Trophy. Second in the event was James Wedell, also in a Wedell-Williams racer, whose average speed was 209.23

Map showing 30,000-mile flight of Col. and Mrs. Charles A. Lindbergh during summer of 1933 to explore future trans-atlantic air routes.

m.p.h. In the Thompson Trophy, Roscoe Turner with an average speed over the 10-mile course of 241.05 m.p.h. was disqualified for first place by failure to round the fourth pylon. James Wedell, with 237.95 m.p.h. to his credit, was therefore awarded first place. Winners of the other events were: Aërol Trophy, Mae Haizlip; Shell Speed Dash, 550 cu. in., Roy Minor; Shell Speed Dash, unlimited, Roscoe Turner; 550 cu. in. Sweepstakes, Roy Minor; 375 cu. in. Sweepstakes, S. J. Wittman.

On the same dates, July 1-5, the American Air Race Association held its meet in Chicago. No records were broken. John Livingston, in his Cessna plane, Warner motored, captured the two main events—the Baby Ruth Trophy and the Aëro Digest trophy, both 500 cu. in., free-for-alls—with average speeds of 201.42 and 204.54 m.p.h. respectively over the five-mile course.

In the International Air Meet, held in Chicago, September 1-4, in the main events, Mae Haizlip flying a Wedell-Williams plane, won the Women's International Free-for-all with an average speed of 191.11 m.p.h. James R. Wedell, who entered a new plane of his own design, won both the Frank Phillips Trophy and the Shell Straightaway Speed Dash, with average speeds of 245.95 and 305 m.p.h., the latter a record in landplane speeds. The James Gordon Bennett Balloon Race, held at the same time, is described later.

The King's Cup race in England, a handicap event, on July 8, was won by Captain G. de Havilland in a Leopard Moth with Gypsy Major engine, who flew the course of 830 miles at an average speed of 139.5 m.p.h.

RECORDS. Non-Stop. The world's non-stop distance record previously held by John Polando and Russell Boardman, was broken on February 8 by O. R. Gayford and G. E. Nicholetts, English aviators, who started from Cranwell, England, and flew to Walvis Bay, Southwest Africa, a distance of 5341 miles in 57 hours and 25 minutes. The flight was made in a special Fairey monoplane, powered with a Napier Lion water-cooled engine. This record was broken on August 7 by the flight of Lieuts. Paul Codos and Maurice Rossi, French aviators, who flew from Floyd Bennett Field, Brooklyn to Rayak, near Beirut, Syria, a distance of 5656 miles in about 56 hours. They flew in a Bleriot 110 monoplane, powered with an Hispano-Suiza engine.

Speed. The greatest officially recorded speed yet attained by man was made on April 10 by Francisco Agello of the Royal Italian Air Force in a Macchi-Castoldi 72 seaplane with a 2800-horsepower Fiat motor. The official speed was 423.77 m.p.h. An unofficial record of 434 m.p.h. was claimed to have been made by Col. Mario Bernasconi using the same plane later in April, and in June Agello made an unofficial record of 440 m.p.h. On November 19, James R. Wedell, made a non-stop flight in his Wedell-Williams monoplane from New York to Miami in five hours maintaining an average speed of better than 300 m.p.h. for the trip.

Transcontinental. On June 2, Lieut.-Commdr. Frank Hawks made a non-stop record transcontinental flight from Los Angeles to Floyd Bennett Field in a little less than 13½ hours, using a De Beeson automatic pilot during the flight. His plane was a Northrop Gamma and was powered by a twin-row Wright Whirlwind engine. On July 25 Hawks made a non-stop flight of 1620 miles

from New York to Regina, Sask., in 10 hours and 42 minutes, and a month later, August 26, flew from Vancouver to Quebec, a distance of 2800 miles in 17 hours and 10 minutes, but encountering storms and fog was forced to land at Kingston for fuel on the trip.

On July 1, Col. Roscoe Turner established a westbound transcontinental record from New York to Los Angeles, making the trip inclusive of stops in 11 hours, 30 minutes, flying a Wasp-powered Wedell-Williams monoplane. On September 25 he established an eastbound record between the same points by flying the distance in 10 hours and 4 minutes.

Amelia Earhart Putnam in a Wasp-powered Lockheed Vega broke the eastbound transcontinental speed record for women by making the flight in 17 hours, 7½ minutes on July 8.

Altitude. Alfred K. Hall, Jr., a 17-year-old pilot, set a new junior altitude record of 16,371 ft. in a Bird biplane over Floyd Bennett Field on July 2.

The women's altitude record in light planes was broken on August 2 by Helene Boucher, French pilot, who established a new height of 19,364 ft. The weight of her plane, empty, was less than 1000 pounds.

Amphibians. Under new rules, established by the Federation Aéronautique Internationale, by which the take-off and landing must be from water before and after the runs over the land, Maj. Alexander P. de Seversky made a new record for amphibians, in a monoplane of his own design, by maintaining an average speed of 177.78 m.p.h. at the National Air Pageant held at Roosevelt Field, L. I., on October 8. On the following day Major de Seversky reached a speed of 187.8 m.p.h.

Gliders. In Austria, on January 27, Robert Kronfeld piloted a glider and 200 lb. of mail a distance of 81 miles between Vienna and Semmering, in an hour and 40 minutes. A duration record of 36 hours and 35 minutes was established by Kurt Schmidt on August 5 in a sailplane near Koenigsberg, East Prussia. The American distance record was broken on September 21 by Richard C. du Pont who flew from Rockfish Gap, Va., to Frederick, Md., a distance of 122½ miles, in a Bowlus sailplane. On October 7, Jack O'Meara established a new record for looping in a glider by making 46 consecutive loops at the National Air Pageant on Long Island.

BALLOONS. There was little activity during the year among balloonists. Beyond the annual James Gordon Bennett Cup race, this year scheduled to be held at Chicago, and several ascensions for scientific purposes into the isothermal layer, the year was uneventful. In March, the Polish balloon *Polonia*, a contestant in the 1932 Gordon Bennett Cup race, made an ascension from Warsaw and was reported to have reached an altitude of 32,808 ft. An extreme low temperature of 72 degrees below zero, Fahrenheit, was reported.

On September 2, the twenty-first running of the international James Gordon Bennett Cup Race was held at Chicago. The contestants, in order of their take-off, were: American, the *Goodyear IX*, piloted by Ward T. Van Orman, winner of three previous Bennett races, with Frank A. Trotter, aide; second, the Belgian entry, piloted by Marcelle van Schelle, with Philippe Quersin; third, the U. S. Navy entry, piloted by Lieut.-Commdr. T. G. W. Settle, with Lieut. Charles A. Kendall; fourth, the German entry *Deutschland*, piloted by Richard Schuetze, with Dr. Erich Koerner;

fifth, the Polish balloon *Kosiuszko*, piloted by Capt. Francizek Hynek, with Lieut. Zbigniew Burzynski; sixth, the French entry *Verdun*, piloted by Georges Ravaine, with Georges Blanchet. A seventh entry, from Germany, broke from its moorings before the race and was destroyed. After official calibration of barographs and checking of landing certificates the winners and places were awarded as follows: First, the Polish entry, Captain Hynek, pilot, distance 846 miles, landing near Launier, Quebec; second, U. S. Navy, Lieutenant-Commander Settle, pilot, distance 776 miles, landing near Branford, Conn.; third, United States, Ward T. Van Orman, pilot, distance 494 miles, landing near Thor Lake, Sudbury, Ont.; fourth, Germany, Richard Schuetze, pilot, distance 251 miles, landing near Kingston, Mich.; fifth, Belgium, Marcelle van Schelle, pilot, distance 229 miles, landing near Rosecommon, Mich.; sixth, France, Georges Ravaine, pilot, distance 155 miles, landing in Homer Township, Mich. The aeronauts Van Orman and Trotter, carried into Canadian wilds were lost for more than a week after their balloon was grounded and destroyed by storm.

Stratosphere. Two expeditions into the isothermal layer were safely accomplished during the year. The first ascension was made at Moscow, Russia, on September 30 under the command of Georgi Prokofief in the U.S.S.R. army balloon *Stratosfat*. A height of 62,304 ft. (11.8 miles) was claimed, but as Russia is not a member of the Federation Aéronautique Internationale the height is not officially recognized. Scientific observations were taken, and a temperature of 89 below zero, Fahrenheit, was recorded.

On November 20, Lieut.-Commdr. T. G. W. Settle and Maj. Chester L. Fordney of the U. S. Marine Corps ascended from Akron, O., after an earlier and unsuccessful attempt to take off from Chicago. Their instruments after calibration recorded an altitude of 61,237 ft. (11.5 miles). The expedition was solely for scientific purposes and the various sealed instruments were turned over to the physicists Millikan and Compton for study, after the balloon was safely grounded in a marsh near Bridgeton, N. J.

DIRIGIBLES. The reliability and success attending another season of the *Graf Zeppelin* as a passenger-carrier and mail-liner between Germany and South American points gave greater assurance to the financial feasibility of the LZ-129 which, laid down in Friedrichshafen in 1932, was nearing completion at the end of 1933. It was announced that the new dirigible will be ready for service in the summer of 1934. It will be the largest airship yet constructed, 813 ft. long, with a maximum diameter of 134 ft.

The *Graf Zeppelin* continued its scheduled flights between Friedrichshafen, Germany, and Pernambuco, Brazil, making nine round trips during the year, as in the previous year. On May 11 it completed its fastest south-bound trip, making the run in 4½ days, but bettered this record in October by making the run in 72 hours, 40 minutes. Following its concluding run of the season, the *Graf* flew northward to Chicago, before returning to its winter base in Germany.

On April 21, the U. S. Naval dirigible *Macon* made its test flight at Akron, and was subsequently accepted. The airship is a sister ship of the *U. S. Akron* (see 1931 YEAR BOOK), and was christened on March 11 by the wife of Rear Admiral William A. Moffett, chief of the U. S. Navy Bureau of Aeronautics. Because of weight-

saving improvements, however, the constructors were able to cut down the overall weight of the *Macon* by about 8000 pounds under that of the *Akron*. The airship was formally placed in commission on June 23, and on October 12 left Lakehurst for her permanent base at Sunnyvale, Calif.

The U. S. dirigible *Akron*, after returning in March from a successful flight of twelve days to the Panama Canal Zone, left its hangar on the evening of April 3 for a two-day practice flight which was to have included a cruise along the coast of New England. In addition to its full complement of seventy-six officers and men, under the command of Commander Frank C. McCord, the ship was carrying Rear Admiral William A. Moffett, Chief of the Navy's Bureau of Aeronautics. While cruising off the New Jersey coast the airship encountered a violent storm and, a little after midnight, according to subsequent findings of the Naval Board of Inquiry, was struck by a down current of wind of such magnitude that the lower fin struck the water before the descent could be checked. The airship was broken up by the sea, and with the exception of Lieut.-Commdr. Herbert V. Wiley, and three men, one later dying from exposure, who were picked up by the German oil tanker *Phocbus*, all on board, including Admiral Moffett, were lost. Immediate search of the area by boat, planes, and the Navy non-rigid blimp J-3 was instigated for other possible survivors. In the search the blimp was blown into the water and two of its crew of seven were lost.

BIBLIOGRAPHY. Among the books published during the year may be mentioned the following: *Aeronautical Ground Engineers' A and B Licenses*, by S. L. Collins (London); *Simplified Aerial Navigation by Dead Reckoning*, by J. A. McMullen (Phila.); *Flying*, by Maj. Gen. J. E. Fechet (Balti.); *Mechanics of Flight*, by A. C. Kermock (London); *Book of the Sky*, revised edition, by M. Luckiesh (New York); *Flying*, by R. Mahachek (New York); *How to Become an Air Pilot*, by R. L. Preston (London); *Liability in the Law of Aviation*, by L. H. Cha (Univ. of Ill.); *Aircraft and the Law*, by H. L. Brown (New York); *Aeronautical Law*, with 1933 supplement, by W. J. Davis (Los Angeles); *Guide to Air Force Law*, by A. G. Somerhough (London); *Financial Policies in the Aviation Industry*, by P. A. Dodd (Phila.); *Aircraft Performance Testing*, by S. S. Hall and T. H. England (New York); *Stresses in Aeroplane Structures*, by H. B. Howard (New York); *Acro Engines*, by J. Frier (London); *Properties and Strength of Materials*, by J. D. Haddon (New York); *Airports and Established Landing Fields in the U. S.*, Airport Directory Co., (Hackensack, N. J.); *Airways of America*, by A. K. Lobeck (Columbia Univ.); *Aircraft Year Book for 1933* (New York).

AÉROPLANES. See AERONAUTICS.

AFGHANISTAN, af-gān'-stān'. A country of Asia between India and the Soviet Union. The area is estimated at 245,000 square miles and the population at 11,000,000; Kabul, the capital, had 80,000 inhabitants; Kandahar, with suburbs, 60,000; Herat 30,000; Mazar-i-Sharif 46,200. Persian and Pushtoo are the chief languages spoken but Turkish is spoken in Turkistan and parts of Badakhshan. There are eight primary and secondary schools in Kabul and all the elementary and secondary schools existing throughout the country are free.

The irrigated fertile plains and valleys of the country yield extensive crops of fruit, vegetables,

and cereals. Fruits, both fresh and preserved, form the staple food of a large part of the population and enormous quantities of preserved fruits are exported. The castor-oil plant, madder, and the asafetida plant grow abundantly. The principal domestic animal is the native fat-tailed sheep which forms the chief meat diet of the inhabitants, the grease from the tail is a substitute for butter. Coal, copper, lead, iron, lapis lazuli, and some gold, are found but there is little mining activity. In Kabul there are factories, owned and supervised by the state, for the manufacture of matches, buttons, leather, and boots; a factory where arms and ammunition, clothing and boots, are made for the army; and a mint.

The imports from India include cotton goods, indigo and other dyeing materials, sugar, leather, and silver treasure. No accurate registration of trade for Afghanistan has yet been made. Considerable trading is done with the Soviet Union. The two main trade routes to India are: Kabul to Peshawar by way of the Khyber Pass, and Kandahar to the railroad terminal at Chaman, India. Afghanistan has no railroads and merchandise is transported chiefly by camels and pony back. Many of the roads are open to motor traffic in dry weather. Kabul is in wireless communication with India and Eastern Europe.

GOVERNMENT. The new Constitution promulgated by King Nadir Shah and made public to the outside world in 1932 provided for an independent constitutional monarchy, with Islam as the state religion. It contained a bill of rights, made primary education compulsory, and forbade slavery and forced labor or the confiscation of personal property, except that of refugees from the country. Provision was made for a Council of State, composed of representatives elected for three years, and for a Chamber of Nobles appointed by the King. King Nadir Shah was assassinated in Kabul on Nov. 8, 1933 and his son Mohammed Zahir Shah (19 years of age) succeeded him to the throne.

HISTORY. The assassination of King Nadir Shah in 1933 eliminated a ruler who in his four-year reign had eradicated rebellion and disorder with a firm hand and started his country on the path of progress. He followed a neutral policy toward both India and Soviet Russia and secured the financial and material aid of Britain in the pacification of his unruly subjects, who were prone to make frequent raids across the Indian border. New automobile highways were constructed and telephone and telegraph communications extended. A Constitution abolishing slavery and making elementary education compulsory was proclaimed in 1932. In August, 1933, through the government's financial aid, Afghanistan's first bank was opened at Kabul.

Nadir's assassin was Abdul Khaliq, a member of the household of Ghulam Nabi Khan, a leading supporter of former King Amanullah. Ghulam had been executed for conspiring against King Nadir a year earlier. The youthful Mohammed Zahir Shah received the support of King Nadir's brothers, Premier Hashim Khan and Shah Wali Khan, the Afghan Minister to Paris, as well as that of the Moslem clergy. On December 16, the murderer and an accomplice were executed, along with 14 others accused of sedition. Two other conspirators were sentenced to life imprisonment.

The Afghan government on July 3, 1933, signed a convention for the definition of aggression pro-

posed on behalf of the Soviet government by Maxim Litvinov, Soviet representative to the World Economic Conference at London. This pact supplemented the non-aggression pact signed between the Soviet Union and Afghanistan in 1926.

AFRICA. The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including Ethiopia; Kenya; Egypt; Morocco; Tunis; South Africa, Union of; etc. See also the articles **ANTHROPOLOGY**; **ARCHAEOLOGY**; **PHILOLOGY, MODERN**; and **EXPLORATION**.

AGNES SCOTT COLLEGE. An institution for the higher education of women in Decatur (Atlanta), Georgia. The enrollment for 1933-1934 was 450. The faculty numbered 48 members, and the officers of administration, 15. The endowment was \$1,350,000, and the gross income for the year was approximately \$270,000. There were 28,600 volumes in the library. During 1933 there has been steady progress made on collecting funds for the carrying out of a development programme of \$1,500,000. President, James Ross McCain, Ph.D., LL.D.

AGRICULTURAL ADJUSTMENT ACT. See **AGRICULTURE**; **AGRICULTURE, U. S. DEPT. OF**; **AGRICULTURAL EXTENSION WORK**; **SOILS**; **LIVESTOCK**; **TOBACCO**.

AGRICULTURAL EXPERIMENT STATIONS. The experiment stations in the United States, its territories and insular possessions, continued to function actively and efficiently in spite of many unfavorable conditions due to the prolonged depression. The income of the stations for the fiscal year ended June 30, 1933, approximately \$15,576,600, was 9.6 per cent below that of 1932 and 13.7 per cent below 1931 when the station revenues were the highest of record. Of the total, the Federal government furnished \$4,359,000, which comprised \$90,000 for each State, \$15,000 for Alaska, and \$24,000 for Hawaii. The Federal station in Hawaii, coordinated with that of the University of Hawaii, received a special Federal appropriation of \$40,000, and the Puerto Rico station, the status of which remained the same as in previous years, had a total income of \$63,560.

Active research projects at the stations totaled approximately 7000, of which the Adams fund supported about 430 dealing primarily with fundamental research, and the Purnell fund nearly 1440 projects, somewhat broader in plan and purpose. About 1000 of the projects were in cooperation with the United States Department of Agriculture and dealt with national, regional, and special problems. Much attention was given during the year to revising research programmes and projects and adjusting them to reduced financial support and to emergency needs.

Many stations were faced with actual or prospective cuts in financial support from State and local sources and with increased demands for aid in dealing with local problems. Reduction in financial support ranged from 0.4 to 80 per cent, necessitating in some cases drastic cuts in salaries and maintenance, with loss of seasoned and experienced staff members, abandonment of important investigations and useful service, and curtailment of publications, but on the whole, more intensive work on major problems that were pressing for immediate attention.

The building programme of the stations was restricted to the more urgent needs of the work

in progress or called for under prevailing conditions. New structures erected in 1933 included a genetics research laboratory at the Iowa Station; a dairy barn and experimental laboratory at the Kansas Station and a crops and soils laboratory at its Fort Hays substation; a cold storage plant at the Highmoor, Maine, farm; and greenhouses at the Maine Station and at the Arkansas fruit and track substation. The new forest products laboratory, erected by the United States Department of Agriculture at the University of Wisconsin at a cost of \$800,000, provided numerous facilities for forestry research. The Florida Station established at Sanford a field laboratory for celery investigations. The University of Idaho was given 3646 acres of forest land to be known as the Moscow Mountain Experimental Forest.

The United States Department of Agriculture was building at the Alabama Station a farm tillage laboratory to determine the most economical implements for the soils of southeastern United States at a cost of \$110,000 obtained from Public Works Administration funds. One of the largest and best-equipped agricultural experiment stations in the world was being established at Beltsville, Maryland, with an allotment of \$1,145,000 from the Public Works Administration. Under the approved plan, the present department station at Beltsville was to be expanded greatly, new laboratories constructed and additional land purchased, and the Bethesda (Md.) Livestock Station, much of the experimental work of the Bureau of Entomology and ultimately other research units were to be transferred to Beltsville.

Recent contributions by the State stations were made toward the solution of certain major and more urgent practical problems in such fields as conserving and increasing soil fertility, introducing new and better crops and methods of farm management, reducing losses from plant and animal diseases and insect pests, improving methods of breeding and feeding animals, and otherwise reducing production costs; aiding marketing and increasing financial returns by improving quality of product; finding profitable means of utilizing surpluses, waste products, and by-products; and aiding rural people to make better use of their resources in improving living conditions. The *Experiment Station Record*, long an important agency in the promotion of agricultural research, continued in monthly issues, completing its sixty-ninth volume.

The Alabama and Wisconsin Stations celebrated their fiftieth anniversaries during the year. Reorganization to promote unity and to reduce costs of administration and to coordinate the work of the station with extension and teaching services variously affected the set-up and staffs of the Iowa, Pennsylvania, Rhode Island, South Carolina, West Virginia, and Puerto Rico (Insular) Stations, and was prospective at other stations. The Institute of Animal Nutrition of Pennsylvania State College was given the status of a department of the school of agriculture and the Pennsylvania Station. Changes occurred in the directorships of the Iowa and Rhode Island stations. C. P. Gillette, head of the entomology department for 43 years and director of the Colorado station, 1910-1932, ended active connection with the college and station July 1.

BRITISH EMPIRE. Because of governmental decision to limit the Empire Marketing Board's net

vote for the year 1932-33 to £300,000, the work of the Board during the year under review had to be restricted almost entirely to maintenance and consolidation of pre-existing activities. The most promising development in its research activities during the year was its part in the initiation of a programme of parasitological research at the newly-established Institute of Helminthology at Macdonald College in Montreal. The Institute started its work under a special associate committee on parasitology of the National Research Council of Canada and a director appointed from Scotland.

Agricultural research in progress under substantial allotments comprised cold storage and food preservation research in England, Scotland, and New Zealand; study of the mineral content of pastures in Scotland, South Australia, and New Zealand; veterinary research in Canada, Australia, and South Africa; wool studies in England; dairy research in British Columbia, New Zealand, England, and Scotland; poultry investigations in England, Scotland, Northern Ireland, and Ontario; processing of pelts in New Zealand; entomological research in Great Britain, West Indies, Mauritius, East and West Africa, and Australia; plant disease investigations in England, Scotland, and Irish Free State; plant breeding in Wales, New Zealand, and Australia; horticultural research in England, New Zealand, Malta, Cyprus, and Palestine; and economic botany and dietetics in England. A grant of £14,400 was made for maintenance to the Imperial College of Tropical Agriculture at Trinidad for the year ended Aug. 31, 1933. This college also received £32,000 from the Carnegie Corporation as an endowment. Financial aid was also extended the tropical research station at Amani, East Africa, and to sugarcane experiment stations in Barbados, British Guiana, and Mauritius. Pineapple research also was subsidized in Mauritius, and a central quarantine station was supported at Trinidad. Other enterprises aided by the Board included a tea research laboratory in India, a tobacco research station at Marandellas, Southern Rhodesia, research with copra in the Federated Malay States, and studies with lac in India and flax in Northern Ireland. The Board was dissolved Sept. 30, 1933.

CANADA. Research in the various fields of agriculture continued to go forward at the several Provincial colleges of agriculture and on the Dominion experimental farms, notwithstanding the necessity for rigid economy and retrenchment. The Canadian Society of Technical Agriculturists, headed by President G. I. Christie of Ontario Agricultural College, former director of the Indiana Station, held its thirteenth annual convention at Regina, Saskatchewan in July, joining with its affiliated groups and the World's Grain Exhibition and Conference in its technical sessions.

CEYLON. The opening of the Coconut Research Scheme at Lunuwila during the year was an additional application of scientific methods to the island's principal industries. The research institutes devoted to tea, rubber, and coconuts, financed largely by their respective industries, allows the Ceylon Department of Agriculture more freedom to deal with general problems, especially village cultivation and new economic products.

CHINA. The Chinese Ministry of Education de-

cided to establish at Tsinghua University at Peiping a modern agricultural school and experiment station, the latter to be located outside the city and to devote special attention to the improvement of wheat and cotton. A gift of \$20,000 to the college of agriculture and forestry of Nanking University was made by Gen. Chiang Kai-shek for the strengthening of its crop improvement programme, especially in Shensi, where a new experiment station was to be established.

U.S.S.R. (RUSSIA). A scientific institute recently established in Moscow to carry on research on the circumstances of formation of cloud, fog, and rainfall has branches in Leningrad, Odessa, Saratov, Tashkent, and Ashkhabad. The Leningrad branch installed apparatus for investigating the effect on the atmosphere of high-tension currents, X-ray, ultra-violet rays, and radioactive radiations. The apparatus was to be tested in experiments carried on in the drought regions of the U.S.S.R.

NECROLOGY. Experiment station workers dying during 1933 included Clarence H. Eckles, head of the dairy husbandry division, Minnesota Station; Roscoe W. Thatcher, research chemist of the Massachusetts Station, ex-president of Massachusetts State College, and former director of the New York State Station; John Belling, research associate in genetics, W. F. Holst, associate poultry husbandman, and Elizabeth H. Smith, assistant plant pathologist, all of the California Station; Clarence R. Phipps, entomologist of the Maine Station; Richard C. Munkwitz, associate dairy husbandman of the Maryland Station; Robert E. Wall and Fred W. Walker, assistant entomologists of the Montana and Florida Stations, respectively; and S. W. Phillips, in charge of the Zanesville (Ohio) soil erosion station. Charles L. Beach, president emeritus of Connecticut Agricultural College, once dairy husbandman at the Vermont and Connecticut (Storrs) Stations, died September 15. Luther Foster, former director of the South Dakota, Utah, Wyoming, and New Mexico Stations, ex-president and dean of the New Mexico College, and associated with the development of agricultural college and station work in the Rocky Mountain area from 1885 to 1921, died June 17. William E. Boyd, specialist in agricultural botany and plant pathology for *Experiment Station Record* since 1911, died August 25. Among Canadian agriculturists, W. T. Macoun, eminent Dominion horticulturist, who rendered much pioneer service in Canada, died August 13; and Frank E. McMillan, professor of apiculture in Ontario Agricultural College and provincial apiarist, died July 14. Dr. O. M. Malte, former botanist of the Dominion Department of Agriculture also died during the year.

AGRICULTURAL EXTENSION WORK.

The work of acquainting farmers with the purpose and opportunities afforded by various governmental agencies organized for the benefit of farmers was the most important responsibility assigned in 1933 to the field agents of the cooperative extension service of the United States Department of Agriculture and the State agricultural colleges. When the Agricultural Adjustment Act was passed in 1933, county agricultural and home demonstration agents, Federal and State extension specialists, and the administrative staffs of the State extension divisions were called on by the Department to carry on the necessary educational work in support of the campaigns to control production of the various commodities. In carrying forward this responsibility in 1933, farmers were given, first, the fullest possible information on the current economic situation with reference to agriculture as a whole and to such basic products as wheat, cotton, corn, hogs, tobacco, and rice.

This was followed by intensive campaigns to lay before farmers the provisions of the emergency plans which had been worked out to enable farmers to adjust their production in line with effective demand. Cotton was the first product to be considered. With only a few weeks in which to put the plan into effect for the 1933 crop, the extension staff in the South, supported by a volunteer staff of more than 20,000 workers, led the six-weeks campaign which made it possible for more than a million growers to sign contracts to reduce their 1933 crop acreage.

Similar methods in the wheat-growing areas resulted in voluntary applications for contracts to bring more than 50 million acres of wheat under the agreements calling for a 15 per cent reduction in acreage for the 1934 crop. Likewise, the extension staffs were utilized for field activities in connection with production-control campaigns for the various tobacco districts and in carrying out a short emergency hog-control plan.

Toward the close of the year, the attention of extension workers was concentrated on preparing for intensive production adjustment campaigns in the Corn and Cotton Belts, looking to a marked reduction in the existing surpluses of cotton, corn, and pork products and aimed at obtaining a balanced production of these commodities.

Under each of these commodity adjustment programmes, following the sign-up of growers to reduce acreage in the commodity, extension workers turned next to the task of helping them in the organization of their own production control associations, through which much of the local administration of the control programmes is handled. These control associations, with their committees and boards, make up a great volunteer staff to carry out the production control work in each community, the county agricultural agent being in most cases the connecting link between the associations and the Agricultural Adjustment Administration. In obtaining the required local aid in setting up these organizations and manning community and county committees, extension agents found the local leadership developed in previous years of invaluable help in facilitating the organization and operation of these associations. There were over 163,000 men and 147,000 women voluntarily cooperating with extension

agents in presenting the extension programme in their respective communities at the beginning of the emergency period. These men and women rendered a signal service as the new adjustment programme developed in explaining its purpose to their neighbors and in inducing their participation in it.

Extension agents, also, provided farmers with complete information regarding the credit and loan facilities available through the Farm Credit Administration and the Commodity Credit Corporation, and farmers in the region concerned are being kept advised about the development of natural resources being undertaken by the Tennessee Valley Authority. Other emergency activities which have demanded the attention of extension workers include the subsistence gardens and food preservation work undertaken for the relief of unemployed.

While the details for the emergency work were growing more clearly defined and the various emergency production phases were being woven into a strongly united agricultural plan, extension agents adjusted their programmes to carry on at full speed both the emergency work and their responsibilities to aid in the solution of those ever-present problems that face the American farm family—reduction of expensive loss and waste in farm operations, better utilization of labor and facilities, economical improvement of quality of products, the provision of a satisfactory standard of living and maintenance of the morale of the family.

Attack on the problem of farm loss was carried steadily ahead by all extension agents. Farmers in every State sought the best information on soil saving. Terracing was a growing activity in 22 States. In Texas about one million acres were terraced during the year. About 24 per cent of the Texas land which would profit by it had already been terraced. Eleven counties now have more than half of the crop acres terraced or contoured. Such wide acceptance of this method of soil and moisture conservation is the result of persistent demonstration for the past 23 years. Use of winter legumes for cover crops and soil improvement was increased greatly in many States.

Iowa farmers who previously suffered a loss of from three to six bushels of corn per acre have largely eliminated this loss by following the seed-treatment method shown in demonstrations supervised by the Extension Service. About 40 per cent of the acreage is now planted to treated seed. With the drought conditions of this season, the prevention of loss was of increased importance. Progress in the adoption of loss-preventing methods for other crops increased.

Preventable loss in crop or livestock production was reduced to increasing extent by the continued effort of extension agents and cooperating farmers. Many counties after some years' effort to move farmers to action in sufficient number practically to control infestation, have prevented much serious loss. Notable examples are Brown County, South Dakota, which has wiped out a yearly loss of approximately \$76,000 from grain smut; Sussex County, Delaware, where sweet potato growers have reduced their stem rot loss from 31 per cent of their plants to only 2 per cent; Pennsylvania poultrymen who sold their products at egg auctions have raised the percentage of their eggs selling in the two highest grades by better production methods from 51 per cent to 84 per cent. Scott County, Virginia, tobacco grow-

ers have learned how to reduce to harmless proportions their annual loss of \$10,000 or more from black fire.

Progress in adjusting farm output to meet changing conditions has been made in many sections of the country. That of Pope County, Arkansas, is typical of what has been done in many counties. Formerly practically a single-crop county, it now receives one-third of its income from its livestock.

One of the outstanding activities of extension workers in all parts of the country has been to aid farmers to achieve their goal in a "live-at-home" programme. Farm resources for production of feed for livestock and food for the family have been developed in many instances to approach the pioneer's self-sufficiency, and in all States there has been a substantial gain in utilization of farm resources.

Home demonstration agents were employed in more than one-third of the counties in the United States. Farm women in many other counties were aided in their problem of homemaking by members of the State extension staff, the county agricultural extension agent, if one was employed, making the necessary plans and arrangements for local meetings. Chief among the problems that the farm woman brought to the home demonstration agent were those of maintaining the family's standard of living, safeguarding the welfare of the children of the home, and augmenting the farm income.

Use of farm resources to provide a good living for the farm family has depended to a great extent on the farm homemaker. Home demonstration agents, who have counseled with them in their clubs and individually, know how well the farm women have measured up to the country's ideal of the pioneer woman in this difficult year. Extension workers have found an increased demand for help in the study of home accounts, in the study of wise expenditure, and in the production and preservation of fruits, vegetables, meats, and other foods. Modern methods of preservation in the home have been put into practice the country over. The amount of equipment used is an indication of the extent of home canning, Texas alone reporting that one hundred million cans have been filled.

Home demonstration agents and specialists have been especially helpful in assisting farm women who wished to sell home products to prepare a standardized quality product, to display it attractively, and, in perfecting their sales organizations so that they would function smoothly and efficiently. Farm women's markets in a number of States have grown to be a considerable factor in adding to the farm income. Sales in North Carolina farm women's markets now total well above \$300,000.

Farm women have been alert to the developments of research in child feeding and, as a result of their cooperative study in home demonstration clubs, have in many instances secured the home production of necessary foods in the face of great difficulties. Clothing for children has occupied an important place in the clothing budget work in many home demonstration groups. In the field of home management the studies have centred about equipment and routines.

In the midst of efforts to solve great economic and social problems, the interest of the entire country, both rural and urban, in the 4-H clubs has not been lessened. Four-H club membership

and work have maintained their excellent records. Keenest interest, perhaps, on the part of the young people has been in ways to assist in the family's problems and in projects which promised some profit.

The regular field force employed to carry on extension work in November, 1933, totaled 5632 persons, 345 fewer than last year. Engaged in agricultural work in the counties were 2232 county agents, 191 assistant agents, and 169 negro agents. The home-economics staff included 1120 county home demonstration agents, 33 assistant agents, 9 urban agents, and 124 negro agents. One hundred and seventy-four county club agents and 19 assistants devoted full time to 4-H clubs, while practically all county extension agents gave a substantial part of their time to boys' and girls' club members. To reinforce the efforts of county extension agents and to assist with more highly specialized problems, were 1084 extension specialists, most of them stationed at the State agricultural colleges. The administrative and supervisory staff in the States numbered 477.

In counties not employing agents included in the territory to which the various commodity adjustment programmes were applicable, it was necessary, to insure proper organization of growers, to place temporary extension agents, the number required being 497. Adding these emergency agents to the number of the regular staff gives a total of 6129 workers in the cooperative extension service for 1933.

The total funds allotted for cooperative extension work in the States and Territories during the fiscal year 1933-34 amount to \$19,896,232; a reduction of three and a half million dollars, or 15 per cent from the amount available during the previous year. Of the total funds allotted \$9,376,177 is from Federal sources, and \$10,520,054 from sources within the States and Territories. The reduction in Federal funds amounted to \$276,823 while funds available from sources within the States were reduced by about \$3,231,946.

Exact figures on extension results for 1933 were not available when this statement was prepared but in every extension activity a greater volume of results was indicated as compared with the previous year. The figures for 1932 show that 1,226,082 demonstrations in improved methods of farming and homemaking were conducted by farmers and farm women with the assistance of extension agents. The number of demonstrations carried on by boys and girls in the 4-H clubs was even larger, being 1,205,108. Supplementing contacts made with farm families through these demonstrations, extension workers made many farm and home visits, held meetings, supplied news items to the local press, gave radio talks, sent out circular letters, displayed exhibits, conducted tours and used every possible means of bringing extension information to public attention. The number of meetings held to demonstrate improved methods was 491,060, with a total attendance of 8,591,266 people. There were 962,158 farms and 387,601 homes visited by extension agents to enable them to discuss their individual problems at first hand with farmers and farm women. These figures afford some indication of the variety of ways in which the Extension Service was brought in touch with farm people and was enabled to serve them.

BIBLIOGRAPHY. Consult Report of Extension Work in Agriculture and Home Economics in the United States, 1932, issued by United States De-

partment of Agriculture; *History of Agricultural Extension Work, 1785-1923*, by A. C. True (United States Department of Agriculture, Miscellaneous Publication 15, 1928); *History of Agricultural Education, 1785-1925*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 36, 1929).

AGRICULTURE. Marked general improvement in the status of American agriculture featured the year 1933. Prices of farm crops rose in response to the epochal programmes for readjusting productive acreage to market requirements, set in motion by the farm relief act approved May 12, 1933, weather conditions, and better consumer buying power due to improved economic conditions. The increased prices plus government cash benefits for acreage reduction combined to lift the national gross farm income by about \$1,250,000,000. Other favorable factors were reduced production costs, lower taxes, and the provision of a complete and coordinated credit system for agriculture. These and other factors in the agricultural industry are discussed in greater detail in the following pages.

AGRICULTURAL SITUATION. The situation confronting agriculture and the Nation early in March, 1933, was epitomized by Secretary of Agriculture Wallace in his report to the President on Nov. 15, 1933. In his words, "Agriculture, in short, was very sick, and the disease from which it suffered threatened also the entire community. Ruinously low farm earnings tended to separate farm operation from farm ownership and to degrade farmers into virtual serfdom. The collapse of farm prices caused a heavy loss in farm valuations, in which farmers' equities were destroyed. All the capital employed in agriculture had a value in January, 1933, of only \$38,000,000,000, as compared with \$58,000,000,000 in January, 1929, and \$79,000,000,000 in January, 1919. Farmers bore the brunt of this terrific decline, because farm debt remained virtually unchanged. Average mortgage debt per acre was nearly three times greater than in the pre-war years. Farm land values had fallen, for the country as a whole, to about three-fourths of their pre-war value. Forced sales of farms had risen to new high levels. . . . Creditors could not collect their claims and became involved themselves. City people could not sell their products to farmers. The stability not merely of agriculture but also of business hung in the balance. . . . The depression robbed farmers of their independence, formerly the chief attraction of country life, and thereby weakened the foundations of our whole economic system. It tended, through foreclosures and bankruptcies, to shift farm ownership from the country to the town, but under conditions that made the shift a peril rather than an advantage to the new owners." During the last six months, however, the Secretary pointed out, agricultural conditions improved greatly, partly because something had been done to balance production with demand and partly because government action had improved the economic situation generally. Farmers of the United States were beginning to plan together under Federal guidance. Rising farm prices and farm incomes and the return of hope and confidence to the agricultural community were evident, although important problems awaited solution.

The total gross income from the farm production of 1933 was expected to approximate \$6,100,000,000 compared with \$5,143,000,000 in 1932.

The 1933 income was augmented by at least \$260,000,000 in rentals and benefit payments from the Agricultural Adjustment Administration. The major factor in the prospective increase was a sharp advance in the prices of nearly all farm products; part was a response to decrease in crop production and in the volume of surpluses, and part reflected an increase in consumer purchasing power and greater utilization of farm products by industry. Increased marketing of livestock and increases in supply of meats were accompanied by only a moderate supply in consumer demand and restricted the income from livestock.

The general level of prices paid to farmers at local farm markets for agricultural products was 68 per cent of the 5-year pre-war average on Dec. 15, 1933, 16 points higher than a year earlier. The advance was led by grains, cotton and cottonseed, and fruits and vegetables in order; meat animal prices averaged the same as on Dec. 15, 1932, while chicken and egg prices were down 26 points. Average prices received by producers, Dec. 15, 1933, based on reports to the United States Department of Agriculture Crop Reporting Board, were estimated for corn 42 cents per bushel, wheat 67.3, oats 31.4, barley 40.6, rye 51.9, flaxseed 151.1, potatoes 69.4, and apples 80 cents per bushel; cotton 9.6 cents per pound, cottonseed \$15.35, and hay \$7.69 per ton. Hogs brought \$2.92 per 100 pounds, beef cattle \$3.12, veal calves \$4.20, lambs \$4.92, and sheep \$2.48. Eggs were 21.6 cents per dozen, butter 21 cents per pound, and whole milk wholesaled at \$1.49 per 100 pounds and retailed at 9.2 cents per quart. Wool brought 24.2 cents per pound and live chickens 8.6 cents; both averaged 9.2 cents a year ago. Milk cows sold for \$31 each, horses \$70, and mules \$84. The corn-hog ratio (number of bushels needed to buy 100 pounds of hogs) was 7 versus 9.2 in November and 14.5 in December, 1932.

Farm real estate values, reflecting the extremely depressed condition of agriculture occasioned by a third consecutive year of declining prices of farm products, falling farm incomes, and further curtailed purchasing power, registered new low levels. The total value of farm real estate in the United States fell from \$37,027,000,000 March, 1932, to \$30,515,000,000 March, 1933, versus \$47,880,000,000 in 1930, and \$66,310,000,000 in 1920. The acre value for all farm lands with improvements, averaged for the country as a whole, decreased from 89 per cent of the pre-war value to 73 per cent during the year ended Mar. 1, 1933, compared with a 17 per cent drop in the previous year. The index mounted to 170 at the 1920 peak. Declines during the year were widespread, and were reasonably uniform over a considerable part of the country, reflecting the continued declines in farm income.

A certain amount of unrest was evident during the year. Thousands of Corn Belt farmers joined the National Farm Holiday Association whose original aim was to curtail the production and sale of farm products. This developed into a movement to halt foreclosures, stop tax sales, prevent deficiency judgments, advance prices, reduce taxes, and declare moratoria on debts for various periods. Farm strikes were ordered. The picketing of highways in several Corn Belt States was accompanied by considerable disorder and property damage. Serious milk strikes occurred in New York, Illinois, and Wisconsin. Reports of efforts of groups of farmers to prevent foreclosure sales were numerous. Governor William Langer of

North Dakota declared on October 16 a wheat embargo prohibiting the shipment of wheat from North Dakota, higher prices being the objective. On November 5, President Roosevelt rejected a proposal of five governors of midwestern States to raise farm prices through compulsion—at the same time the Agricultural Adjustment Administration was making special efforts to expedite the existing farm relief programme.

Credit. Facilities for short-term credit, like mortgage facilities, were badly disrupted by the depression. Country bank failures increased and deposits dropped in banks that did not fail. Failure or restriction of production credit may reduce farm production but it prevents many farmers from adequately carrying on their farming operations. The Federal government had attempted since the war to improve the inadequate credit facilities in many rural areas through emergency measures and new permanent agencies, including agricultural loans by the War Finance Corporation in 1921, the Federal Intermediate Credit Banks in 1923, the financing of coöperatives through the Federal Farm Board in 1929, seed loans during nine years, the capitalizing of agricultural credit corporations and livestock-loan companies, and crop-production loans by the Reconstruction Finance Corporation. However, these several activities were not enough to cope with the critical situation which developed as the depression was prolonged. Therefore in 1933, Congress took additional action in Title II of the Agricultural Adjustment Act which contains provisions for the refinancing of farm indebtedness and also provides means for redeeming land taken from farmers by foreclosure. Congress, by strengthening the capital structure of the Federal land banks and furnishing substantial sums for mortgage loans to farmers, gave private lending agencies an opportunity to transfer loans which they could not hold, and thus to avoid foreclosing on farm borrowers; it relieved farmers materially by authorizing the Federal Farm Credit Administration (see below) to reduce the interest rate on Federal land bank bonds, and temporarily to waive payments on the principal; and it made direct loans available to farmers in districts where local farm-loan associations were not in a position to accept loan applications.

Mortgage Debt. The farm-debt situation continued to be one of the worst aspects of the farm problem. The total farm-mortgage debt in the United States declined from nearly \$9,500,000,000 in 1928 to about \$8,500,000,000 in 1932. Such reduction appeared to be largely a result, not of normal liquidation but of foreclosures, bankruptcies, and forced sales, and of the inability of local banks and of other credit agencies to lend. Forced sales in 1932 comprised 37 per cent of all transfers versus 27 per cent in 1928. The number of such sales during the year ended Mar. 15, 1933, exceeded those of any previous year of record, approximately 15.3 farms per 1000 being sold for taxes, and 38.8 involved in transfers in settlement of debt. Surveys by the United States Department of Agriculture indicated that on Jan. 1, 1933, about 38 per cent of mortgaged farms operated by owners were indebted for one half or more of their value, and 36.6 per cent between 25 and 50 per cent. The largest proportion of farms with high-debt ratios was in the west north central States. The plight of the farm, because of delinquency and lower land values was intensified

by increasing difficulty in renewing mortgages at their original amounts.

Farm mortgage loans during the year ended Jan. 1, 1933, were smaller in total volume and in average size of loans and there were lower ratios of loan to value of property than in the previous year, mortgage bankers in 16 western, north central, and southern States reported. Of the total, only 14 per cent in number and 9 per cent of the amount represented new loans. Life insurance companies took 61 per cent of the total versus 71 in 1932, savings banks 15 per cent, private investors 11, and the mortgage bankers retained 12.4 per cent. In October, 1933, farm mortgage loans by 39 life insurance companies totaled \$1,266,000,000 a progressive decline from \$1,606,000,000 in 1927; by Federal Land Banks \$1,125,000,000 versus \$1,197,000,000 in 1929; by Joint Stock Land Banks \$364,000,000 versus \$667,000,000 in 1927; by banks of Federal Reserve System \$308,000,000 June 30, 1933, versus \$489,000,000 June 30, 1926; by Federal Intermediate Credit banks to cooperate associations \$7,000,000 and to financing agencies \$126,000,000; outstanding seed and crop production loans \$101,000,000; and loans of regional agricultural credit corporations, \$147,000,000.

Taxes. Farm real estate taxes per acre declined an average of 22 per cent between 1929 and 1932, the United States Department of Agriculture reported late in 1933, but the average value of farm real estate against which the taxes were levied fell about 37 per cent, and gross farm income fell about 57 per cent from 1929 to 1932, and net farm income fell about 60 per cent, so that taxes in relation to value and to farm income rose nearly 24 and 100 per cent, respectively, from 1929 to 1932. The decline in average farm tax from 58 cents an acre in 1929 to 46 in 1932 was the first in twenty years. The north central and west south central States showed the largest regional declines in farm real estate taxes per acre, and New England the least. While information regarding farm taxes levied in 1933 was not available, it appeared that wherever farm incomes had improved over those of 1932, the farmers' tax burden had correspondingly lightened, this view being based on the assumption that on the average the 1933 levy probably was somewhat lower than that of 1932.

Exports. The value of exports of agricultural products from the United States, excluding forest products, dropped to \$588,169,000 in the year ended June 30, 1933, the lowest since 1895-96, and 22 per cent less than in 1932. The volume of exports also was less than in 1931-32. Agricultural products composed 42 per cent of all exports. Wheat, including flour, the largest single item contributing to the decline, totaled 41,225,000 bushels, the smallest export since 1872 and less than one-third the volume of the year before, whereas more barley, corn, and oats were exported than in 1931-32. Cotton, with 8,647,000 bales (fiscal year) made up 55 per cent of the total agricultural exports, tobacco and fruits each 11 per cent, meat and meat products, including animal fats and oils 9 per cent, and grain and grain products under 7 per cent. Cotton, fruits, and unmanufactured tobacco made the best showing in 1932-33 (annual volume index) with exports equaling or exceeding the pre-war level, but like other agricultural groups, declined compared with 1931-32.

Imports. During the fiscal year 1932-33, im-

ports of agricultural products (excluding forest products) declined sharply, in value more than in volume, totaling \$811,688,000, 27 per cent under 1931-32, and the lowest value since 1907-08. Agricultural imports made up more than 52 per cent of all imports. Coffee continued to lead the imports while raw sugar supplanted raw silk in the second place. The imports included raw sugar 2,951,000 tons worth \$101,840,000, about 10 per cent decrease in volume and 5 per cent in value under 1931-32 and fruit \$30,492,000, 20 per cent below 1931-32. Substantial declines were recorded in volume and value of imports of nuts, vegetables, wool, butter, milk, hides and skins, olive oil, flaxseed, silk, rubber, and coffee, while imports of meat, palm, and tung oil, and copra gained in volume but at a reduction in value.

Population. The farm population of the United States was estimated from United States Department of Agriculture surveys to be the highest in history, 32,242,000 on Jan. 1, 1933, as compared with 31,241,000 on Jan. 1, 1932, and the previous high census estimate of 32,076,960 in 1910. The movement from towns and cities to farms totaled 1,544,000 while 1,011,000 left farms for urban centres. Balancing these movements and births and deaths resulted in a net gain of 1,001,000 persons in farm population. Increasing unemployment in cities forced many farm young folks to remain on the farm or to return from cities for refuge on farms of parents or relatives. A larger proportion of the farm-to-city movement in 1932 consisted of people leaving foreclosed or tax-delinquent farms and tenants or croppers unable to obtain credit for farm operations.

AGRICULTURE. CROP PRODUCTION IN 1933. The area of all crops harvested in the United States in 1933, exclusive of fruits and nuts, was estimated to be 327,324,230 acres, about 9 per cent less than was harvested in 1932. Causes of the decrease in acreage from 1932 included failure of about 14,000,000 acres of winter wheat fall-sown in 1932, very unfavorable weather at planting in many parts of the country, very heavy loss of spring grains, largely due to drought and particularly in the Northern Great Plains, and the plowing under of 10,384,000 acres of cotton. Combining all crops, yields per harvested acre averaged 5.5 per cent below 1932 and 5 per cent below the average of the previous decade, although 2.9 per cent above those of the drought year 1930. Yields were particularly low in an area extending from northern Texas to central Montana into western Minnesota. The reduced acreage harvested and very low average yields combined to produce an unusually low total volume of crops, the composite production of the ten principal field crops, in proportion to population, being markedly lower than in any season for at least 40 years. The wheat, oats, and rye crops were each the smallest recorded in 35 years, and corn, flax, buckwheat, and hay were unusually short crops.

The farm value of the 1933 crops in the United States was estimated to be \$4,076,537,000 compared with \$2,879,517,000 in 1932 and \$4,102,354,000 in 1931. The increases in value over 1932 were particularly marked in corn, cotton, wheat, and tobacco, which were appraised at a total of \$2,153,025,000, an increase of 62 per cent over last year. The increase in value was attributed to the higher prices which farmers were receiving.

The wheat crop of the United States was esti-

mated at 527,413,000 bushels from 47,493,000 acres, a decrease of 29 per cent in production from 9,711,000 fewer acres than in 1932. The acreage harvested and the total production were for winter wheat 28,420,000 acres, 351,030,000 bushels; durum 2,310,000 acres, 16,109,000 bushels; and other spring wheat 16,763,000 acres, 160,274,000 bushels. The 1933 wheat production of 45 countries which produced the greater part of the 1932 world wheat crop, exclusive of Russia and China, was officially estimated to total 3,542,706,000 bushels compared with 3,719,735,000 in 1932. The Canadian crop amounted to 269,729,000 bushels versus 443,061,000 in 1932. The 1933 production in 29 European countries was reported at 1,699,494,000 bushels versus 1,490,490,000 in 1932. The Soviet Union crop was estimated at 1,018,893,000 bushels. See WHEAT.

The 1933 corn crop, estimated at 2,330,237,000 bushels, was 19.8 per cent smaller than the 1932 crop and 10 per cent below that of 1931. Yields in 1933 were considerably below average yet corn matured well, due to the unusually favorable autumn. The total acreage, 102,239,000, was 5.2 per cent less than in 1932, and the yield per acre averaged 22.8 bushels, compared with 26.8 in 1932. Production of corn for grain was estimated at 2,025,015,000 bushels, and the remainder of the corn crop was used for silage, fodder, hogging, and grazing. Corn production in 18 foreign countries amounted to 825,194,000 bushels, about 16 per cent less than from the same countries last year. Eleven European countries reported a total of 588,884,000 bushels versus 741,279,000 in 1932. The Soviet Union crop was estimated at 188,966,000 bushels. See CORN.

The oats crop of 1933 was estimated to be 722,485,000 bushels, and harvested from 36,541,000 acres, compared with 1,246,658,000 bushels in 1932 from 41,425,000 acres. The yield per acre averaged 19.8 bushels, 10.3 bushels less than in 1932. Oats production in 32 countries accounting in 1932 for nearly all of the world total, excluding Russia and China, amounted to 2,922,037,000 bushels, 15.8 per cent less than in the previous year, and that of 25 European countries 1,785,863,000 bushels versus 1,715,863,000 in 1932. The Canadian crop was estimated at 326,695,000 bushels and the Soviet Union crop at 1,061,653,000 bushels. See OATS.

Barley production in 1933 was estimated to total 156,104,000 bushels raised on 10,052,000 acres averaging 15.5 bushels per acre compared with 302,042,000 bushels on 13,346,000 acres averaging 22.6 bushels in 1932. The barley crop in 41 countries was reported to be 1,298,871,000 bushels, about 12.2 per cent below their 1932 production. The crop in 26 European countries reporting showed a total of 721,499,000 bushels; in the Soviet Union, 360,544,000 bushels, and in Canada 63,737,000 bushels. See BARLEY.

The rye crop in 1933 fell to 21,184,000 bushels on 2,352,000 acres from 40,639,000 bushels on 3,344,000 acres in 1932. It averaged 9 bushels per acre in 1933 and 12.2 in 1932. The rye crop in 1933 in 30 countries reporting, accounting for the greater part of the world production, except the U.S.S.R. and China, was estimated to total 1,031,814,000 bushels against 1,003,197,000 bushels in 1932. The Soviet Union produced about 952,308,000 bushels in 1933.

Buckwheat production totaled 7,844,000 bushels from 462,000 acres versus 6,727,000 bushels from 454,000 acres in 1932. Rice made 35,619,000

bushels on 760,000 acres, compared with 40,408,000 bushels harvested from 868,000 acres in 1932. See RYE, RICE.

Flaxseed production in 1933 totaled 6,785,000 bushels from 1,283,000 acres as compared with 11,671,000 bushels and 1,975,000 acres in 1932. Kafir, milo, feterita, and other grain sorghums produced an estimated equivalent of 87,884,000 bushels from 8,143,000 acres, 17 per cent below the year before but on a 4 per cent larger acreage. The portion of the acreage harvested for grain produced 57,282,000 bushels versus 65,339,000 bushels in 1932. The broomcorn crop, 32,900 tons from 296,000 acres, was 4000 tons less than in 1932.

The production of sorghum (sorgo) sirup in 1933 amounted to 14,961,000 gallons; sugar cane sirup, 19,106,000 gallons; maple sugar, 1,322,000 pounds; and maple sirup, 2,175,000 gallons. The sugar beet crop of 1933 was estimated at 11,085,000 tons of beets from a record acreage of 984,000 acres, expected to produce about 1,629,000 tons of sugar, versus 9,070,000 tons of beets from 764,000 acres in 1932. The area of 213,000 acres of sugar cane in Louisiana was expected to produce 202,000 tons of sugar, 21,000 tons less than in 1932.

The fourth successive short hay crop, 9.6 per cent below that in 1932 and 1.1 per cent above 1931, was estimated to total 74,485,000 tons, of which tame hay made up 65,852,000 tons and native or wild grasses 8,633,000 tons. The production of important kinds of hay included alfalfa, 24,899,000 tons; clover and timothy, 25,159,000 tons; sweet clover, 690,000 tons; lespedeza, 527,000 tons; annual legume hay, 3,974,000 tons; grain hay, 4,531,000 tons; sweet sorghum forage, 4,800,000 tons and other hay crops, 6,072,000 tons. Larger yields of lespedeza and alfalfa seed and smaller crops of seed of timothy, clover, and sweet clover were reported in 1933. See HAY.

The potato crop was estimated at 317,143,000 bushels compared with 358,009,000 bushels in 1932 and the average acre yield 99.6 bushels versus 105.9 in 1932. The sweet potato crop was estimated to be 65,073,000 bushels, the peanuts harvested for picking or threshing at 920,505,000 pounds, cowpeas harvested for peas, 5,846,000 bushels, and soy beans harvested for beans, 11,177,000 bushels. See POTATOES.

Tobacco production in 1933 was 1,396,174,000 pounds, 37 per cent larger than the 1932 crop, from 1,753,700 acres. The acreage of all types other than sugar was increased 31 per cent over the 1932 acreage but the acreage of cigar types was reduced about 40 per cent. The flue-cured class was estimated to comprise 708,488,000 pounds compared with 376,157,000 pounds in 1932; fire-cured 138,455,000 pounds; Burley, 416,252,000 pounds; Southern Maryland, 17,710,000 pounds; dark air-cured, 41,801,000 pounds; cigar filler, 35,010,000 pounds; cigar binder, 31,987,000 pounds; and cigar wrapper 6,153,000 pounds. See TOBACCO.

The 1933 cotton crop of the United States, according to December 1 estimates, was 13,177,000 bales, about 1.3 per cent greater than the 1932 crop, but 1,489,000 bales, or about 10 per cent below average production for the period 1928-1932, and the cotton was harvested from 30,144,000 acres, about 16 per cent less than in 1932. The yield of lint per acre averaged 209.4 pounds in 1933 and 173.3 in 1932. The lint was valued at \$617,716,000, and the 5,858,000 tons of

seed at \$79,532,000. Exports of cotton during the cotton year ended July 31, 1933, totaled 8,419,399 bales compared with 8,707,548 in the previous year. Germany, United Kingdom, France, and Italy were the major consuming countries that greatly increased their imports while China took more than 811,000 fewer bales than in 1932. See COTTON and articles on other individual crops.

AGRICULTURAL ADJUSTMENT ACT. Part I of the Agricultural Adjustment Act, approved May 12, 1933, declared the policy of Congress to be to raise the purchasing power of American farmers to the level which it occupied in the five years 1909 to 1914, when agricultural and industrial production and prices were well balanced and the national income was equitably distributed. Since the World War agricultural production had not been contracted as effective export and domestic demand for farm goods had contracted. Over-supply of agricultural commodities resulted and reduced farm prices; and agricultural purchasing power fell far below parity with the purchasing power of other industries. The Act in order to remedy these conditions, empowered the President, through the Secretary of Agriculture and the Agricultural Adjustment Administration set up within the United States Department of Agriculture, to assist farmers in adjusting their production of certain basic commodities to meet effective demand without sacrificing income and to put into effect marketing agreements on agricultural commodities, designed to insure fair prices to producers, efficient and equitable distribution of the products, and protection for consumers of the finished goods.

Benefit payments and rentals made it possible for a farmer cooperating with other farmers and the government to reduce his production without also reducing his already inadequate income. In connection with certain basic agricultural commodities, i.e. wheat, cotton, corn, hogs, tobacco, rice, and milk and its products, the Secretary of Agriculture was authorized to make compensatory payments to producers in return for agreements to curtail their acreage or their production for the market, and to levy taxes on the first domestic processing of any of the basic commodities, in order to raise funds for such payments. The act also appropriated \$100,000,000 under title I for administrative expenses and compensatory payments, and authorized the Treasury to advance funds to the Secretary of Agriculture in anticipation of the proceeds of processing taxes. In addition, the National Industrial Recovery Act, approved June 16, 1933, authorized the President to allocate not more than \$100,000,000 of the \$3,300,000,000 appropriated by that act for expenditures in carrying out the Agricultural Adjustment Act and for the Farm Credit Administration.

Organization and Operation. The Agricultural Adjustment Administration, headed by an Administrator, was organized in four operating divisions including production; processing and marketing; finance; and information and publicity divisions. Operations designed to balance production with demand were centred in commodity sections under the production division which operated in close relationship with the processing and marketing division. The dairying, tobacco, rice, special crops, and food products sections conducted both production and processing and marketing activities. The interests of the consumer

were safeguarded by the consumer's counsel, and there also was a section to analyze codes and marketing agreements. At the outset, George N. Peek of Moline, Ill., and Charles J. Brand of Washington, D. C., were appointed, respectively, administrator and co-administrator. Mr. Brand relinquished his position October 1, and Mr. Peek, appointed special assistant to the President on American foreign trade policies, was succeeded Dec. 15, 1933, by Chester C. Davis, director of production. The Administration's activities were coordinated closely with those of the rest of the Department of Agriculture. It utilized the Extension services of the Department and the States and the Department's information service in basic production reduction programmes and in educational and organization work and drew heavily on the Bureau of Agricultural Economics for special information and services.

The Adjustment Administration followed two main lines of attack—adjustment of production to demand, and the establishment of marketing agreements. In addition under the President's executive order of June 26, 1933, codes of fair competition for industries engaged mainly in handling milk and its products, tobacco and its products, all food and foodstuffs, and alcoholic beverages were filed with the Adjustment Administration.

Wheat and cotton, the outstanding cash crops, were among the major products which were in the most desperate situation in the spring of 1933, and tobacco and rice had some of the same difficulties. Each had been sharply affected by the decline in foreign outlets, production had exceeded consumption for several years, and surplus stocks had been built up to record levels. Production control efforts for the 1933 crops were centred primarily on cotton (see COTTON for details) as the extreme drought during the year made such control unnecessary for wheat in 1933. For other basic crops, arrangements were made for production control in 1934.

Wheat and Cotton. A control plan for wheat planted and harvested in subsequent years was developed which provided for cash benefit payments to be made on account of wheat grown in 1933, 1934, and 1935 to cooperating farmers agreeing to reduce acreage for harvest in 1934 and 1935. Negotiations simultaneously carried forward with foreign countries to secure their cooperation in readjusting international wheat supplies were concluded successfully in the signing of the International Wheat Agreement in August, 1933, and as a consequence, the other important wheat producing countries of the world were taking steps to cooperate with the United States in removing the excess supplies. Due to various causes, the cut in acreage did not quite attain the reduction called for, 15 per cent below average seedings in the base period, 1930 to 1932, and supplementary plans to remove additional acreage from production were to be put into effect before spring planting ended, so as to bring the acreage for 1934 harvest within the agreed limits. The approximately 52 million acres under contract with more than 500,000 wheat farmers, in 1700 counties of 37 States who agreed to reduce their 1934 plantings 15 per cent under their average past acreage, meant about eight million acres out of 1934 production. These farmers, guaranteed adjustment payments of 28 cents a bushel on their domestic allotments, expected to receive approximately \$102,000,000, funds being provided by a

processing tax of 30 cents a bushel estimated to yield \$108,000,000. The North Pacific Emergency Export Association, formed under a marketing agreement with producers, millers, and exporters in Washington, Oregon, and Northern Idaho to relieve a price-depressing surplus, was exporting wheat and flour purchased at domestic prices and sold at world prices, the average difference of about 21 cents a bushel being met from processing tax receipts.

In wheat, as in cotton, farmers' income was materially increased by benefit payments besides the increase in farm prices; including benefit payments, cooperating farmers received almost the full parity income on that part of their crop for domestic consumption. The progress in wheat and cotton control was shown in prospective reduced world carryover of American cotton and in a sharply-reduced domestic-wheat carryover.

Estimates were that collections of processing taxes on cotton in the current year beginning Aug. 1, 1933, would reach \$120,000,000, and compensating taxes on imports about \$1,000,000, netting about \$116,000,000 with compensatory taxes between \$10,000,000 and \$12,000,000 on jute, and about \$3,000,000 on paper. The processing tax on wheat was expected to yield \$108,000,000. In both cotton and wheat, the quantities processed were increased greatly prior to the imposition of the processing tax and fell off for a while thereafter. While the exact effect of the tax on consumption was currently uncertain, it seemed evident in both cases that practically the full amount of the tax had been passed on to the consumers and that its application had little or no effect on prices paid to producers.

Other Crops. Tobacco and rice presented problems somewhat similar to those of wheat and cotton, although complicated by specific technical conditions. Adjustment programmes seeking to bring production more nearly into line with consumption requirements were underway for cigar-leaf, flue-cured, Burley, fire-cured, dark air-cured and Maryland tobacco. (See TOBACCO.) These programmes and marketing agreements with domestic buyers were expected to give growers greatly increased returns for several kinds for the 1933 crop as compared with returns from the 1932 and 1931 crops.

Despite the virtual collapse of their export market, United States rice growers were receiving approximately "fair exchange value" for their product, and prevailing farm prices were about double those of a year ago, and furthermore, the spread between producer and consumer prices was substantially less than that prevailing during the base period. This result was achieved through a comprehensive industry plan which was incorporated in marketing agreements signed by nearly every operating rice mill in the United States. All existing growers' organizations participated in drawing up these agreements.

With perishable fruits and vegetables, only marketing agreements were available under the Act. Material progress was made in developing agreements to regulate marketing of such products and to prevent excessive pressure of production upon the available markets. Special crop industries operating under agreements included California cling peaches; citrus fruits in California, Arizona, Texas, and Florida; California deciduous fruits, Tokay grapes, canned ripe olives, and walnuts; and northwest deciduous tree fruits; and other agreements were under consideration.

A satisfactory marketing agreement for sugar cane and sugar beets was not concluded.

Livestock and Livestock Products. The problems presented by livestock and livestock products differed decidedly from that presented by cash crops. The Adjustment Administration sought to develop a programme which would correct the low-price situation more rapidly than possible if it were left solely to the usual development of competitive changes. Hogs were the only livestock for which a complete production control programme was developed during the year. The fact that cattle were not a basic commodity under the Act precluded an attempt to develop such a programme for them. Desire of dairy farmers to exhaust the possibilities of stabilizing prices through marketing agreements or operations in the butter market caused the Adjustment Administration to defer efforts to control production of dairy products until application of those methods had demonstrated that they alone were not enough to cope with the real problem.

The first portion of the hog programme was an emergency plan designed to reduce the supply of hog products in the 1933-34 winter and to relieve pressure of current receipts at the market. The emergency pig slaughter programme in the fall of 1933 served to reduce the number of hogs in the winter, while purchases of hogs for relief purposes removed a substantial portion to be marketed of the heavy runs from market supplies. The second part of the hog plan covered production control of corn and hogs for next year and was being presented to hog farmers. As this production control became effective, it was expected to reduce materially the size of the coming pig crops and reduce the pressure of supplies beginning with the winter season of 1934. (For details see DAIRYING, LIVESTOCK.)

Surplus Relief. The Federal Surplus Relief Corporation, organized in September, 1933, under the joint control of the Agricultural Adjustment Administration and Federal Emergency Relief Administration, with funds from Congressional appropriations, loans from the Reconstruction Finance Corporation, and part of the proceeds from processing taxes, by purchase removed from commercial channels of trade apparently existing surpluses of various commodities for distribution to the unemployed and their families. Such distribution was intended to provide for consumption of these commodities without decreasing ordinary purchases. Cooperation with the Surplus Relief Corporation so far had been limited to such basic products as hogs, wheat, and dairy products for which processing tax funds could be made available. Expenditure for pork, butter, and cheese was expected to bring the total from the Agricultural Adjustment Administration's fund to \$30,000,000.

FARM CREDIT ADMINISTRATION. Pursuant to the provisions of an Act approved Mar. 20, 1933, President Roosevelt on March 27 transmitted to Congress an executive order, effective May 27, reorganizing the agricultural credit agencies of the Federal government. The order consolidated in the Farm Credit Administration, the functions of the Federal Farm Board, the Federal Farm Loan Board, and the functions of the Secretary of Agriculture as to loans in aid of agriculture, and those of the Reconstruction Finance Corporation in the management of regional agricultural credit corporations, and abolished the functions of the Federal Farm Board with regard to fur-

ther stabilization operations. Henry Morgenthau, Jr., appointed chairman of the Farm Board Mar. 6, 1933, was designated Governor of the new organization. William I. Myers, succeeded Governor Morgenthau November 17 when the latter was appointed Acting Secretary of the Treasury.

The Farm Credit Administration is headed by a governor and deputy governors under whom are the land bank commissioner in charge of farm loans and supervising the 12 Federal land banks, the national farm loan associations, and the joint-stock land banks; the cooperative bank commissioner who supervises the central bank for cooperatives and the 12 regional banks for cooperatives and also directs other special services for cooperatives; the production credit commissioner who supervises the 12 production credit corporations and the various production credit associations; and the intermediate credit commissioner who supervises the 12 Federal intermediate credit banks. The United States is divided into 12 districts, each containing a regional land bank, a regional bank for cooperatives, a regional production credit corporation and a regional intermediate credit bank, which four institutions have the same board of directors and comprise the Farm Credit Administration of the district. A general agent is responsible for coordinating their operations and activities.

Loans. The 12 Federal land banks, possessing a total capital of \$188,514,499 on June 30, 1933, lend only upon first mortgages on farms with funds obtained primarily from the sale of farm loan bonds to investors. The current interest rates were 5 and 4½ per cent. Farm loan bonds outstanding on June 30, 1933, amounted to \$1,147,897,220 and outstanding loans to \$1,118,434,268. The Federal land banks were authorized to issue and sell to investors within two years beginning May 12, 1933, a special issue of 4 per cent, tax-exempt, farm loan bonds in the amount of \$2,000,000,000, with interest to maturity guaranteed by the United States government, to make new loans, purchase mortgages or exchange farm loan bonds for mortgages. Besides regular long-term farm loans, each land bank, acting for the land bank commissioner, lends to farmers in its district upon the security of first or second mortgages on farm real or personal property from a \$200,000,000 fund made available by the Emergency Farm Mortgage Act of 1933. Practically all commissioners' loans were made on the security of second mortgages on farms. The current interest rate was 5 per cent.

In each land bank district, production credit was made available through local production credit associations, cooperative organizations of farmer borrowers serving a territory generally consisting of several counties, which make loans for general agricultural purposes including crop production, breeding, raising, and fattening of livestock, and production of poultry and livestock products. Money to lend for agricultural production purposes is obtained by endorsing farmers' notes and discounting them with the Federal intermediate credit bank in the district. The production credit association is assisted and supervised by the district production credit corporation which also helps to organize associations and provides most of their capital. Each production credit corporation has an initial capital of \$7,500,000 provided by the Farm Credit Administration. The interest rate charged the farmer varied from 6 to 6½ per cent. As production

credit corporations and associations were organized in the different land bank districts, they were expected to take over from the regional agricultural credit corporations (created by the Reconstruction Finance Corporation as authorized by the Emergency Relief and Reconstruction Act of 1932, with an aggregate capital of \$44,500,000) the function of furnishing production credit and the latter to make no new loans. Similarly, seed loans and crop production loans made through the Department of Agriculture were to be liquidated gradually and this function assumed by local production credit associations.

The banks for cooperatives and the Federal intermediate credit banks in the 12 Federal land bank districts were making loans to cooperative purchasing and cooperative marketing associations. The banks for cooperatives were lending working capital (interest rate Dec. 1, 1933, 4 per cent) and facility loans (currently at 4½ per cent) to buy, build, lease or refinance the cost of acquiring physical facilities needed by cooperatives for preparation, handling, storing, processing or merchandising of agricultural commodities or products derived therefrom. The central cooperative bank was capitalized initially at \$50,000,000; the capital stock of regional banks for cooperatives vary to meet credit needs of eligible borrowers in their districts. Loans to the associations generally were made by the Federal intermediate credit banks against the warehousable products they handled to enable associations to make advances to their members between the times of delivery and of sale of the products, or where it was necessary to finance the transportation, storage and handling of such products. The interest rate Dec. 1, 1933, was about 3 per cent.

During the period May 1-Dec 31, 1933, 35,300 loans totaling \$140,138,663 by Federal land banks and 44,029 loans totaling \$70,812,112 by the land bank commissioner were closed in the United States and Puerto Rico. The same agencies reported that the 458,065 farm mortgage loans outstanding in the United States Dec. 23, 1933, aggregated \$1,248,233,586. The largest proportion of the proceeds of the land bank and commissioner's loans were used for refinancing indebtedness. Loans and discounts outstanding Nov. 30, 1933, amounted to: Federal land banks \$1,172,400,140; land bank commissioner to farmers \$34,098,555, and to joint stock land banks \$1,097,413; Federal intermediate credit banks \$136,861,440; regional agricultural credit corporations \$142,504,048; crop production loan offices \$91,824,563; Agricultural Marketing Act loans to cooperatives \$141,107,605; central bank for cooperatives \$10,629,900; and regional bank for cooperatives \$350,014.

Federal Farm Board and Related Activities. The Farm Credit Act and the President's order resulted in abolishment of stabilization operations, eliminated provisions for crop insurance and loans for purely promotional purposes, and put loans to cooperatives on a business basis by fixing limits of 3 and 6 per cent interest. In taking final steps to close up the Farm Board's stabilization activities in wheat, which began in 1930, Governor Morgenthau announced that these operations, plus donations of wheat to the American National Red Cross had resulted in a net loss to the Board's revolving fund estimated at more than \$184,153,232, i.e. loss on stabilization operations \$160,334,489, and on Red Cross donations \$23,818,743. The purchases of the Grain

Stabilization Corporation, May, 1930, to Mar. 3, 1933, announced to 370,278,449 bushels of cash wheat and 538,337,000 bushels of wheat futures. The corporation sold 237,204,468 bushels through regular domestic and foreign markets channels, and a total of 47,500,000 bushels was sold to foreign governments or exchanged for coffee. On Mar. 7, 1933, the corporation had disposed of all of its cash wheat, had sold all of its futures on April 29, and on September 28 all transactions involving the donation of stabilization wheat and cotton to the Red Cross were completed. Under Congressional authorizations of March 7 and July 5, 1932 and Feb. 8, 1933, a total of 85,000,000 bushels of wheat and 844,063 bales of cotton was delivered to the Red Cross.

The chairman of the Farm Board announced Mar. 21, 1933, that the Red Cross had 548,043 bales and the Cotton Stabilization Corporation 28,875 bales, while the American Cotton Cooperative Association had 1,352,619 bales and the Staple Cotton Cooperative Association 214,800 bales, both of cotton of the 1930-31 season, or a total of 2,144,937 bales. As of Feb. 28, 1933, the American Cotton Cooperative Association owed the Farm Board \$71,015,748, the Staple Cotton Cooperative Association owed \$11,511,258, and the Cotton Stabilization Corporation owed \$97,530,235. The remainder of the Stabilization Corporation's cotton, 19,306 bales, was offered for sale May 16, 1933. The loss to the Farm Board's revolving fund through the operation of the Stabilization Corporation was estimated at about \$94,000,000.

The American Cotton Cooperative Association voluntarily surrendered (August, 1933) a commitment of \$10,000,000 of government funds for handling cotton for the 1933-34 season at $\frac{3}{4}$ of 1 per cent interest and accepted a 4 per cent rate for the same financing and also agreed to subscribe to capital stock of the Central Bank for Cooperatives up to 5 per cent of its borrowings. It also acted as agent for the Agricultural Adjustment Administration in marketing actual cotton when growers cooperating in reduction programmes called their options.

On May 27, 1933, the Farm Credit Administration had liens on about 797,000 bales of cotton, security for loans made prior to 1933 crop production, and between May 27 and September 1 this was reduced to about 588,000 bales through sales by farmers. This cotton was being sold in pursuance of a liquidation plan announced September 10 by Governor Morgenthau. Sales were evenly distributed throughout the period ended November 30, but for every bale of spot cotton sold, one bale of long futures was bought for the use of the Secretary of Agriculture in carrying out the acreage reduction programme under the Agricultural Adjustment Act.

WORLD AGRICULTURE. At the London Wheat Conference in August and September, 1933, importing countries agreed not to encourage further extensions of their wheat area and to adopt measures to increase wheat consumption. They agreed to reduce wheat tariffs after the world price of wheat had been maintained for 16 weeks as high as 63.02 gold cents per bushel. Beginning in the season 1934-35, after the present season's large crop was consumed, they were to gradually relax other restrictions on wheat imports to restore more normal conditions in the wheat trade. Argentina, Australia, Canada, and the United States were to limit exports during the 1934-35 crop year to a quantity not exceeding the exportable

surplus resulting in case each country had average yields and made a 15 per cent reduction in the area sown. The four exporting countries of the Danube Basin would export not more than 54,000,000 bushels during 1933-34 and not more than 50,000,000 bushels in 1934-35. In a supplementary exporters' agreement export quotas for the respective crop years (August-July) 1933-34 and 1934-35 were tentatively fixed; Argentina, 110,000,000 and 148,000,000 bushels; Australia 105,000,000 and 150,000,000 bushels; Canada 200,000,000 and 263,000,000 bushels; and the United States 47,000,000 bushels for 1933-34 and 90,000,000 for 1934-35. Quotas allotted Canada and the United States were minimum quotas, to be increased if import demand warrants, to reduce surplus stocks in these countries.

Other movements variously affecting the world-trade relations of American agriculture included plans for aiding the hog industry in Great Britain, Denmark, and The Netherlands; The Netherlands' dairy relief scheme; the animal fat protection programme and the new Federal hereditary homestead law in Germany; the crop price-fixing plan in Argentina; the Soviet Agrarian policy; the French programme to protect domestic wheat, and various other world trade barriers handicapping American agriculture. These several movements; the world situation in bread and feed grains, sugar, oil and oil seeds, cattle and beef, hogs and pork, and sheep and wool; and the agricultural exports, imports, and reexports of the United States and its agricultural trade with the territories were discussed in detail during the year in *Foreign Crops and Markets* and in special publications of the U. S. Department of Agriculture. See the respective countries under *Agriculture or Production*.

BIBLIOGRAPHY. Publications in 1933 or late in 1932 which dealt with problems of current interest in agriculture included: *United States: E. de S. Brunner and J. H. Kolb, Rural Social Trends* (New York, 1933); F. E. Clark, ed., *Readings in Marketing*, rev. ed. (New York, 1933); C. Day, *Economic Development in Modern Europe* (New York, 1933); F. E. (Paris, 1932); Unión Nacional Económica, *La Reforma Agraria* (Madrid, 1932).

The Bureau of Agricultural Economics of the United States Department of Agriculture issued bibliographies on the domestic allotment plans for the relief of agriculture; measures taken in foreign countries to relieve agricultural indebtedness; state measures for the relief of agricultural indebtedness in the United States, 1932 and 1933; price analysis; farmers' response to price; barter and scrip in the United States; group and chain farming in the United States, January, 1930-March, 1933; part-time farming; agricultural college publications relating to farm population and rural life; and Greece and Rumania: guides to official statistics of agriculture, population, and food supply; and *Foreign Crops and Markets* (weekly).

See BUSINESS REVIEW.

AGRICULTURE, U. S. DEPARTMENT OF. On Mar. 4, 1933, Henry A. Wallace of Iowa, editor of *Wallaces' Farmer* and *Iowa Homestead*, became Secretary of Agriculture, and on March 6 Rexford G. Tugwell, professor of economics at Columbia University, New York, assumed the office of Assistant Secretary of Agriculture. The retiring officers were Arthur M. Hyde of Missouri and Renick W. Dunlap of Ohio. Other important changes in the personnel of the Department during the calendar year included the retirement on January 31 of Walter H. Evans for 41 years active in the Office of Experiment Stations of the Department and among other duties in charge of the organization and administration of the agricultural experiment stations in Alaska, Hawaii, Puerto Rico, Guam, and the Virgin Islands; on September 30 of Charles L. Marlatt, connected with the work of the Department in economic entomology since 1889 and Chief of the Bureau of Entomology since 1927; on October 31 of Beverly T. Galloway, with the exception of two years

connected with the Department since 1887 in different capacities including Chief of the Bureau of Plant Industry and Assistant Secretary of Agriculture, and on December 31 of William A. Taylor in the Department's service since 1891, mainly in pomological work, and since 1913 Chief of the Bureau of Plant Industry. On October 23 occurred the death of Robert Y. Stuart, head of the Forest Service of the Department since 1928 and in that branch of the service since 1906. Lee A. Strong, Chief of the Plant Quarantine and Control Administration of the Department, was appointed Chief of the Bureau of Entomology effective October 1, F. A. Silcox, of New York, Forester, or head of the Forest Service, effective November 15 and Knowles K. Ryerson, in charge of the Division of Foreign Plant Introduction of the Bureau of Plant Industry, chief of that bureau effective Jan. 1, 1934. On April 1 Seth Thomas of Iowa replaced Elton L. Marshall as solicitor of the Department.

The Agricultural Adjustment Act (see AGRICULTURE) approved May 12, 1933, imposed many new and important duties upon the Department. To meet these requirements a separate organization with a special corps of workers was established under the title of the Agricultural Adjustment Administration. The following officers were included among the appointees to the more responsible positions: George N. Peek of Illinois, administrator, Charles J. Brand of Washington, D. C., coadministrator, Chester C. Davis, of Illinois, production administrator, M. L. Wilson, of Montana, wheat production administrator, Cully A. Cobb, of Georgia, cotton production administrator, Guy C. Shepard, of Illinois, administrator in charge of trade agreements in processing and distribution, A. G. Black, of Iowa, chief in corn and hog production, Gen. W. I. Westervelt, of Illinois, director of marketing and processing, H. R. Tolley, of California, chief of the Section of Specialty crops, J. B. Hutson of the Department, acting chief of the Tobacco Section of the Production Division, Jerome N. Frank, of New York, general counsel, and Oscar Johnston, of Mississippi, finance administrator. Smith W. Brookhart, formerly United States senator from Iowa, was made special adviser for developing trade in agricultural products with eastern European countries. Charles J. Brand resigned from the position of coadministrator after about four months of incumbency and George N. Peek, the administrator, toward the close of the calendar year took charge of a government agency outside of the Department created for the promotion of foreign trade.

The Secretary of Agriculture in his report for the fiscal year ended June 30, 1933, reviewed the customary research, extension, and information work of the Department but dwelt more especially on the economic situation as it affects agriculture and the means and methods applied to achieve recovery. The subjects considered included the problem of surpluses, agricultural adjustment legislation, farm relief, scientific production, and distribution, control of agricultural production, reduction in the acreage of cotton and wheat, adjustments in the production of hogs, dairy products, fruit, and vegetables and the relation of farm real estate values, debts, and taxes to the agricultural situation.

Expenditures from appropriations administered by the Department of Agriculture for the fiscal year amounted to \$252,861,396 of which \$70,134,-

656 was for the general work of the Department and \$182,726,740 for emergency activities including \$177,977,564 for road construction (see *Roads and Streets*). In addition unpaid obligations for road work totaling \$454,832,059 were incurred under emergency highway funds. Of the amount for the general work of the Department over \$15,000,000 represented payments to the States for support of agricultural experiment stations, extension work, and other activities. Only 5.7 per cent of the Department's total expenditures were used for research.

The employees of the Department during the fiscal year numbered 26,544 comprising 5521 in the departmental service and 21,023 in the field service including 80 stationed in foreign countries. The total number of books and pamphlets in the Department library reached 242,075 during the fiscal year.

AGÜERO Y BETANCOURT, ARISTIDES DR. A Cuban diplomat, died in Geneva, Switzerland, June 21, 1933. Born in 1865, he was educated for the bar but turned to education and taught for several years (1890-95, 1899-1904) at the University of Havana. In 1898 he took part in the Spanish-American War, serving as a colonel in the Cuban rebel army. Dr. Agüero began his diplomatic career in 1904 when he was appointed chargé d'affaires at the Cuban embassies in Berlin and Vienna. He was Minister to Argentina from 1910 to 1912, to Norway from 1912 to 1914, and from 1914 to 1917 to Germany. When Cuba entered the World War he was transferred to Brussels, where during the next three years he served as Minister to Belgium and Switzerland. He resumed his post in Berlin in 1920 and after 1924 was Minister to both Germany and Austria. For several years he was also acting Minister to the Netherlands.

Dr. Agüero was Cuba's representative to the First Assembly of the League of Nations in 1920 and served thereafter in that capacity. Elected vice-president of the Fourth International Labor Conference in 1922, he filled the same office at the International Opium Conference in 1924, and in 1927 was president of the Third International Conference on Freedom of Communications and Transit. During 1927-30 he represented Cuba on the Council of the League of Nations, and in June, 1928, presided over the fiftieth session of that body. He was a delegate in 1931-32 to the General Conference for the Reduction and Limitation of Armaments.

AIR CONDITIONING. See ELECTRICAL INDUSTRIES; ELECTRIC TRANSPORTATION; PHYSICS; RAILWAYS.

AIRPLANES. AIR RECORDS, AIRSHIPS, ETC. See AERONAUTICS.

AKRON, U.S.S. See AERONAUTICS.

AKRON, THE UNIVERSITY OF. A coeducational institution of higher learning in Akron, O., founded in 1870 as Buchtel College and taken over by the city and renamed in 1914. The enrollment for the summer session of 1933 was 254 students, and for the autumn day session, 1227 students, distributed as follows: College of liberal arts, 600; home economics department of liberal arts, 62; teachers college, 224; college of engineering and commerce, 341; 1007 students were enrolled in the autumn evening session. There were 82 faculty members. The amount of endowment was \$141,517 and the income for the year, including tax levy from the city, \$297,518.

There were 34,000 volumes in the library. President, Hezzleton E. Simmons, M.S.

ALABAMA. POPULATION. The population of the State on Apr. 1, 1930, according to the Fifteenth Census, was 2,646,248; in 1920 it was 2,348,174; in 1933, by Federal estimate, it was 2,697,000. Montgomery, the capital, had in 1930, 66,079 inhabitants; Birmingham, 259,678.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton . . .	1933	2,417,000	980,000 ^a	\$46,060,000
	1932	2,021,000	947,000 ^a	28,990,000
Corn	1933	3,031,000	35,978,000	24,036,000
	1932	3,224,000	37,076,000	13,718,000
Hay (tame)	1933	516,000	346,000 ^b	3,495,000
	1932	626,000	424,000 ^b	3,010,000
Sweet potatoes .	1933	76,000	5,396,000	3,507,000
	1932	101,000	8,585,000	3,091,000
Peanuts . .	1933	377,000	213,005,000 ^c	5,325,000
	1932	466,000	242,320,000 ^c	2,423,000
Potatoes . .	1933	32,000	2,304,000	1,705,000
	1932	36,000	2,484,000	1,664,000

^a Bales. ^b Tons. ^c Pounds.

MINERAL PRODUCTION. The production of coal, normally providing the chief part of the revenue derived from the State's raw minerals, fell again, to 7,850,000 tons (preliminary estimate) for 1932; this total was 34.6 per cent less in quantity than the 11,998,771 tons of 1931 and was 56.2 per cent less than the total for 1929. The estimated shrinkage of production for 1932, as compared with 1931 was as heavy proportionately as in any other State. There were produced (1932) 1,400,597 net tons of coke, as against 2,943,143 for 1931; by value, \$3,770,988 (1932) and \$8,023,595 (1931). The coke production of 1932 came entirely from by-product ovens; it consumed 2,025,710 net tons of coal, equivalent to somewhat more than one-fourth of the year's output of coal.

The mines' shipments of iron ore were even more sharply reduced, to 1,470,445 gross tons (1932), from 3,629,997 (1931); in value, to \$2,428,227, from \$6,155,995. The quantity of pig iron produced (1932) was 652,898 gross tons, as against 1,640,851 for 1931. Only 3 of the 25 blast furnaces in the State were in blast at the end of 1932.

EDUCATION. The inauguration of a budgetary system for the State, while favorable in some respects to the finances of the public schools, produced some complaint among school people on the ground that the State's arrangements for financial control attributed to education more than its just proportion of the deficiency in revenues. Under the terms of an enactment of 1933 the diversion of educational funds to uses other than those prescribed was made a criminal offense.

Figures for the operation of the public schools as a whole were not available for the year 1933. For 1932, the number of pupils enrolled was stated as 639,836. Of this total, 503,977 were in grades from the first to the sixth, inclusive; in higher grades, through the twelfth, 135,859. The year's expenditures for public school education totaled \$18,542,177 and thus ran by some 14 per cent below those of 1931. Salaries of teachers averaged, for 1932, \$571 among holders of elementary positions, \$961 in the high schools, and \$682 for both groups together.

LEGISLATION. A special session, necessitated partly by the popular rejection, in November, 1932, of required amendments to financial and fiscal provisions of the Constitution, was convened in January, 1933, and concluded on April 15. It again submitted amendments to provide a State income tax and to validate some \$17,000,000 in outstanding unpaid State warrants, largely held by teachers. It also offered, for ratification by popular vote, an amendment to prohibit the reduction of State and county officers' salaries during terms for which they had been elected. The warrant-validating amendment contained a provision against State expenditure in excess of income. The Legislature passed and, over Governor Miller's veto, repassed a measure calling for a State convention of delegates elected by the people, to act on the repeal of the Federal Eighteenth Amendment. A bill was passed to permit counties and cities to build and operate electric distributing units, in order that they might avail themselves of current that the Federal development at Muscle Shoals was expected to provide. The extension of the National forest system beyond the existing boundaries of the Alabama National Forest was authorized. A bill to permit the traffic in 3.2 per cent beer and another to provide a sale tax failed.

POLITICAL AND OTHER EVENTS. Banks in the State were closed for 10 days on March 1 by proclamation of Governor Miller. Question as to the validity of the State's floating debt of some \$20,000,000 was admitted in an opinion of the State Supreme Court relative to a suit to enjoin a payment to the Chase National Bank. The greater part of the public schools closed before the end of April for lack of money to continue paying teachers. At an election on July 18 voters elected a State convention of delegates favoring repeal of the Eighteenth Amendment; adopted amendments to the State constitution validating some \$17,000,000 of State floating debt in the form of warrants and providing for an income tax; and suspended for 2 years the State constitution's prohibition of reductions in State and county officers' salaries by Legislative act applicable to terms of office to which holders had already been elected. The State convention on the Eighteenth Federal Amendment was held on August 8 and declared the State for repeal of that amendment by the superseding amendment proposed by Congress. The prosecution of the "Scottsboro case," against members of a band of negro minors accused of the rape of two white women, was resumed and led in April to the conviction of Haywood Patterson, one of the accused, despite one of the women's having testified in recantation of her former testimony. Judge Horton passed sentence of death on April 17, but on June 22 he voided the conviction as against the evidence and transferred the cases against the defendants for subsequent retrial outside of the Scottsboro area. At Decatur, Patterson was retried and, on December 1, found guilty and condemned to death. Sentence was stayed by motion for appeal.

Birmingham, at a local election in the autumn, voted against a proposal for a municipally owned system of electric distribution needed in order to bring the electric energy from Muscle Shoals to the urban consumers.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, B. M. Miller; Lieutenant-Governor, Hugh D. Merrill; Secre-

tary of State, Peter B. Jarman, Jr.; Treasurer, Sidney H. Blan; Auditor, John Brandon; State Superintendent of Education, A. F. Harman.

Judiciary. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, Thomas E. Knight, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, and Joel B. Brown.

ALABAMA, UNIVERSITY OF. A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1933 the enrollment was 4225; the summer school registration was 1765. The faculty for 1933-34 numbered 200. The productive funds of the university amounted to \$4,126,445, and the income for the year was \$1,107,475. The library contained about 85,000 volumes, of which 20,000 were government documents. President, George H. Denny, Ph.D., LL.D.

ALASKA. A territory of the United States, the most extensive of the noncontiguous territories and possessions under the American flag. It forms a peninsula at the northwestern extremity of the North American Continent. Its total area is 586,400 square miles. The capital is Juneau. The population, according to the Fifteenth Census, was 59,278 in 1930; in 1920 it was 55,036. Of the population of 1930, 28,640 were whites, 29,983 were Indians (Eskimos not being separately totaled), and the small remainder were largely Japanese. The enumerated members of the so-called Indian group had increased from 26,558 for 1920 and had thus become more numerous than the whites, formerly the greater element (27,883 in 1920). The proportion of individuals under the age of 20 years was notably high, their number (1930) being 23,598 and having risen by about 15 per cent in the decade. By contrast, the proportion of females in the population was low, hardly (1930) attaining two-thirds of the number of males.

MINERAL PRODUCTION. Continued increase in the production of gold, coupled with further recession in other mineral production, brought the gold production of 1932 to somewhat more than seven-eighths of the entire mineral output, by value, of the Territory for that year. Thus was indicated a radical alteration in the relative ranks of mineral products, since for 1927 gold had furnished much less than half of the value of mineral production and had indeed been surpassed by copper.

The value of the output of gold for 1932 rose to \$10,209,000, in the gold-standard dollars then still in use, from \$9,507,000 for 1931. By reason of the depreciation of the dollar in the course of 1933 a much higher dollar valuation of the gold product of this year was indicated. The production of copper fell, for 1932, to 8,738,000 pounds, which was some 14,000,000 less than the quantity produced in 1931; the value of the copper output fell more sharply, to \$550,500 (1932), from \$1,877,000 (1931). The production of silver (1932) was valued at \$66,000; that of lead, at \$75,600. With regard to silver this reduced production did not reflect depressed activity due to a decline in the silver market; for silver was not mined in the territory for its own sake, but only in ores sought primarily for content in gold or in copper.

The yield of coal attained (1932) the quantity of 102,700 tons, and was moderately less than that for 1931; in value, it attained \$513,500, as against \$556,000 for 1931. The Territory exported no coal; in addition to consuming its

native product it imported, in 1932, some 28,422 tons from the State of Washington and other domestic sources and 13,959 from foreign sources, chiefly British Columbia. The year's total production of minor minerals, mainly marble, limestone (for cement), petroleum, platinum (and kindred metals), and quick-silver reached the value of \$223,400. The value of the entire yearly mineral product fell to \$11,038,000 (1932) from \$12,278,000 (1931).

With regard to the high-grade semianthracite coal of Anthracite Ridge in the Matanuska Valley, data from the Geological Survey, published in June, confirmed the report of 1932 that the deposits did not justify development. The verdict of the Geological survey dashed the hope that coal could here be dug for the Pacific Coast markets, bringing needed traffic to the Alaska Railroad.

A Federal estimate for 1933 put the value of the gold produced in that year at \$10,758,000; of silver, at \$64,500; of coal, \$500,000; and of all other minerals, copper included, at \$134,500. But the gold in these figures was reckoned at the obsolete statutory price of \$20.67 an ounce; it actually fetched considerably more over the latter part of the year, and the dollar value of the entire year's gold product tended therefore to run materially above the estimate.

REINDEER HUSBANDRY. A general reindeer supervisor was appointed for the territory early in 1933; a Montana cattleman, Lyman J. Brewster, was chosen for the position. At the same time it was announced that the Secretary of the Interior would cause a round-up of reindeer to be held in the Territory in the course of the year. Plans for such a round-up had been studied for two years by a committee headed by Senator Kendrick of Wyoming and Representative Scott Leavitt of Montana. The intention was to mark the beasts and distribute them among owners, so as to prevent subsequent depredation and dispute. The practice had been adopted of marking the reindeer, in token of ownership, by characteristic cuts on the ear, and of marking females only, attributing other, unmarked individuals to herds of the several owners in proportion to each herd's number of marked females. According to the estimate of the Department of the Interior the reindeer in Alaska in 1933 numbered from 600,000 to 800,000. They were naturally restricted to the moss-covered areas for winter feed, but so extensive was this area that further increase of the number was regarded as a certainty. The policy of the government was to have natives, chiefly Eskimo, form reindeer associations which should obtain joint grazing rights and exercise common protective interests. Also, to endeavor to furnish reindeer to all qualified Eskimos desiring to become herders.

FISHERIES. Commercial fisheries employed 20,122 persons in 1932 for more or less of the year; these were 2455 fewer than for 1931. The output of canned salmon for 1932 attained 5,254,483 cases; in value, \$21,715,801. It fell slightly below that of 1931 in quantity and about \$7,380,000 below in value. The value of the product of all fisheries (save furs), \$25,028,920 for 1932, was \$8,565,832 below 1931.

SEALING AND FURS. At the Pribilof Islands were taken, in 1932, 49,336 skins of fur seals, slightly less than the take for 1931. The herd remaining were computed in August, 1932, to number 1,219,961, or 92,879 more than a year

before. Fur-bearing land animals were shipped from the territory in 1932 to the value of \$1,144,841, a decreased total due to lower prices for furs. The issue of permits and licenses for fur capture, fur farming, and hunting declined sharply.

FORESTRY. The Chugach and Tongass forests were reckoned great enough to furnish 1,000,000,000 board feet of commercial timber a year without impairment, but were reported in 1933 to have yielded not over 18,000,000 board feet, for 1932.

TRANSPORTATION. Train service on the Alaska Railroad was considerably curtailed late in 1932, but the usual summer passenger schedule was put on in 1933. The *Nenana*, a new steamboat for the river service connecting the northern end of the railroad with Yukon River points, built at Nenana, went into service in 1933. She was to replace two old boats and to make a round trip to Marshall fortnightly. Freight traffic on the rail and water lines declined only slightly for the year ended June 30, 1932; all revenues amounted to \$1,215,828 and cost of maintenance and operation to \$1,403,478. Reduced costs lowered the yearly deficit, in the face of reduced revenue. Efforts to promote settlement along the railroad lines, however, were balked by bad economic conditions.

BANKING AND FINANCES. Banks doing business on June 30, 1933, numbered 11 Territorial and four National institutions. Deposits in Territorial banks totaled \$5,957,328, or some \$332,000 less than a year before; capital, \$615,000. The National banks had deposits of \$3,911,008; their capital, surplus, and profits totaled \$528,075. The total valuation of assessed property in the 17 incorporated towns of the Territory, for the fiscal year 1933, was \$25,556,441.

EDUCATION. The Bureau of Indian Affairs maintained, in the academic year 1932-33, 99 day schools for the sparse and scattered Eskimo and Indian population. These schools had 4229 pupils, who constituted not quite one-seventh of the indigenous population. The bureau operated, also for indigenous pupils, three vocational boarding schools, an orphanage, and a school for the blind; the orphanage, however, was closed at the end of the fiscal year.

POLITICAL AND OTHER EVENTS. John W. Troy of Juneau, appointed Governor of the Territory, assumed office in April. The Territorial Legislature of 1933 appropriated \$484,060 for divers measures of relief for specified classes of the population, with some allowance for relief of destitute in general. Bills were introduced in Congress to transfer to Territorial authority the control over fisheries and game, and to repeal the law prohibiting alcoholic drinks in Alaska.

ALBANIA, al-ba'nia. The smallest kingdom in the Balkans, having an area of 10,629 square miles and a population at the census of May 25, 1930, of 1,003,068 (828,593 in 1927). Capital, Tirana (population 30,806 in 1930). Other chief towns are Scutari (Shkodër), 29,209; Coriza (Korça), 22,787; and Elbasan, 13,796. Reigning sovereign in 1933, King Zog I, who assumed the throne Sept. 1, 1928.

PRODUCTION AND COMMERCE. Agriculture and cattle raising are the chief occupations in this largely rugged and mountainous country. The principal products are timber, wool, hides, furs, tobacco, dairy products, olive oil, grain, bitumen, and livestock. The extensive forests and the considerable mineral resources are largely undeveloped. Some copper, salt, and bitumen are

produced. The principal industries are those connected with agriculture. The trade balance has been unfavorable for some years, due to Italian loans and expenditures in Albania. In 1931 imports totaled 29,513,000 gold francs (1 gold franc equals \$0.1929 at par), compared with exports of 7,509,000 francs. The 1932 imports were 22,814,500 francs; exports, 4,500,360 francs. Italy supplied imports valued at 13,840,000 gold francs in 1931 and took exports worth 4,966,000 francs.

FINANCE. Budget estimates for the fiscal year ended Mar. 31, 1932, placed revenue at 29,097,000 gold francs and expenditure at 31,533,422 francs. Albania received an Italian loan of 50,000,000 gold francs in May, 1925. In June, 1931, the Italian government signed an agreement to lend the Albanian Treasury not more than 10,000,000 gold francs annually for a period of ten years. The agreement provided for control of these expenditures by a commission of two Italians and two Albanians.

COMMUNICATIONS, ETC. Communication is chiefly by highways except in the north, where pack animals are in use. In 1930 there were 857 miles of completed roads and 350 miles under construction. Five air lines, under Italian control, connect the principal towns. The only railway, 22 miles in length, connected Tirana and the port of Durrës, which has been improved.

The constitution, amended in 1928, vests executive power in the King, assisted by a council of ministers appointed by him and by a one-chambered parliament of 59 members elected indirectly for four years. Premier in 1933, Pandeli Evangjeli.

HISTORY. A reaction against Italian influence in Albania was indicated during 1933. In June King Zog ordered the closing of all private schools in Albania, the great majority of which were run by Italian religious orders. Government schools, with Albanian teachers, were established in place of those closed. With the return of several hundred Italian teachers to Italy, the Italian government brought pressure upon Albania to meet the unpaid interest on the 1925 loan. When no interest was forthcoming, Italy recalled its military adviser in Tirana, General Pariani, and stopped installments on the 1931 loan. King Zog's apparent rebellion against Italian tutelage was induced by the growing discontent among the educated classes of his subjects, who resented his acquiescence in Italy's domination. He had failed to check this unrest by the summary arrest of some 200 opponents in 1932, despite the severe penalties inflicted. In September, 1932, the special emergency court at Tirana had sentenced 7 to death, 14 to life imprisonment, 13 to 15 years' imprisonment, and 1 to three years' imprisonment.

In retaliation for King Zog's rejection of a customs union proposal, Italy in 1933 placed a tariff on Albania goods which practically strangled the foreign trade of its small neighbor and caused a deficit in the Albanian budget.

ALBERT, FRANÇOIS. A French statesman, died in Paris, Nov. 23, 1933. Born in Bordeaux, Apr. 4, 1877, he attended the Higher Normal School and upon his graduation entered upon a teaching career, later becoming a member of the faculty of the University of Bordeaux. As a radical journalist he edited during the World War Clémenceau's paper, *L'Homme Enchaîné*. He became a member of the Senate in 1920, and four years later was appointed Minister of Education in Herriot's

cabinet. On his election in 1928 to the Chamber of Deputies he distinguished himself as an orator for the cause of the Radical Socialist party.

Appointed Minister of Labor by Edouard Deladier in January, 1933, M. Albert succeeded during his brief administration in settling several labor disputes, including a general strike at Strasbourg, but he was not asked to retain this portfolio when the Sarraut cabinet was formed in October on account of criticism of his approval of social insurance. Among his political works were *Les Unifiés et le Gouvernement de M. Clémenceau* (1919) and *Le Procès Malvy* (1920). He was a Chevalier of the Legion of Honor.

ALBERTA, ăl-bŭr'tă. One of the Prairie Provinces of Canada between British Columbia on the west and Saskatchewan on the east. Area, 255,285 square miles; population (1931 census), 731,605 as compared with 588,454 in 1921. Edmonton, the capital, had 79,197 inhabitants in 1931; Calgary had 83,761; Lethbridge, 13,489; Medicine Hat, 10,300. There were 17,252 births, 5302 deaths, and 5142 marriages, during the year 1931. In the same year there were 3762 schools, including 64 consolidated schools and 16 rural high schools, with 168,730 pupils; three normal schools (Calgary, Edmonton, and Camrose) for the training of teachers with 1250 students; the University of Alberta had 1938 students in 1931-32.

Farming is the chief occupation, but coal mining and the extraction of natural gas and petroleum are important secondary industries. The total acreage sown to field crops was 14,019,000 in 1932 compared with 13,455,936 in 1931. Estimated gross agricultural revenue for 1932 was \$114,976,000 of which \$83,331,000 represented field crops. Production of the chief crops in bushels for 1932 was: Wheat, 104,000,000; oats, 101,500,000; barley, 19,700,000; rye, 1,988,000. The potato crop amounted to 2,102,000 cwt.; hay, 495,000 tons; grain hay, 3,238,000 tons. Mineral production in 1932 was valued at \$21,163,727 (\$23,580,727 in 1931) of which coal accounted for \$13,517,860; petroleum production was 912,506 barrels valued at \$2,739,095; the natural gas output was valued at \$3,820,722. The fur industry produced 1,145,888 pelts in 1932. In 1931 the gross value of manufacturing production from 886 factories was \$107,427,003; number of employees averaged 11,798; salaries and wages, \$14,213,753; and cost of materials, \$36,090,169.

For the fiscal year ended Mar. 31, 1932, ordinary revenue and expenditure was \$13,492,430 and \$18,645,481 respectively. On the same date, net general debenture debt was \$91,450,000. In 1931 there were 5709 miles of railroad lines in the Province. A modern telephone system is owned by the Province, except for the city of Edmonton and the town of Banff, with 220,938 miles of wire, 320 exchanges, and 274 toll stations. For currency problems see CANADA under *History*.

Executive power rests nominally with a lieutenant-governor appointed by the Dominion government, but actually with the Executive Council of the Provincial Legislature. Of 63 members of the Legislature (1933), 37 were United Farmers of Alberta, 11 Liberals, 7 Conservatives, 4 Labor, 3 Independents, and 1 (Camrose) was vacant. The Province sends 6 members to the Senate and 16 to the House of Commons at Ottawa. Lieutenant-Governor in 1933, William L.

Walsh; Premier and Provincial Secretary, John E. Brownlee. See CANADA.

ALFALFA. The production of alfalfa hay in the United States in 1933 was estimated by the Department of Agriculture at approximately 24,899,000 tons as compared with 26,207,000 tons in 1932, and 23,800,000 tons, the average production for the 5 years 1926-30. The average yield per acre, in 1933 was 1.94 tons, in 1932, 2.08 tons, and for the 5-year period mentioned 2.04 tons. The area in alfalfa placed at 12,775,000 acres was 1.8 per cent above the area in 1932 and about 14 per cent above the average annual acreage for the 5-year period. Canada reported a yield of 1,770,000 tons of alfalfa hay from an area of 694,000 acres. The yield was slightly above that of the preceding year and 2 per cent below the average production for the 5 years 1927-31, and the acreage was 4.2 per cent above that of 1932 but 10.2 per cent below the 5-year average.

Reports from almost every alfalfa seed growing State indicated a larger yield than in 1932. The 1933 crop was estimated at 55,000,000 to 60,000,000 pounds compared with the low yield of 32,300,000 pounds the preceding year and with 56,700,000 pounds, the average for the 5 years 1926-30. For the year ended June 30, 1933, the United States imported only 41,200 pounds of alfalfa seed of which 33,000 pounds came from Belgium and the remainder from France, Argentina, and Canada. Imports of alfalfa seed during the last 5 years have averaged only about 422,000 pounds. The exports during the calendar year 1932 amounted to 1,564,600 pounds and were the largest on record. The larger portion of the exports went to France, a country usually producing a surplus. The European alfalfa seed production in 1933 was again reported below the average. Since 1925 alfalfa seed production has undergone a marked reduction in Utah where annual yields as high as 22,000,000 pounds or approximately 40 per cent of the country's crop have been produced and where in 1932 the yield was under 2,000,000 pounds. This decline in yield is attributed to several factors, the more important being a rising water table, high temperatures during the growing season, and drought conditions during a series of years.

In the fall of 1933 growers received an average price of \$7.75 per hundred pounds for common alfalfa seed as compared with \$7.50 in 1932, \$8.50 in 1931, and \$16 the 5-year average. The prices for Grimm alfalfa seed of the 1933 crop ranged from \$9 to \$12.

ALGERIA. A French colony in North Africa, divided into Northern Algeria (area, 80,117 square miles; population in 1931, 5,978,833) and Southern Algeria (area, 767,435 square miles; population in 1931, 574,618). All except 222,206 square miles is desert. The chief cities (1931) were: Algiers, the capital, 257,122; Oran, 163,743; Constantine, 104,902; Bône, 68,778. The total European population in 1931 was 920,788 (762,852 French). The native population is entirely Mohammedan. There were 214,066 pupils in elementary and secondary schools in 1932 and 2200 in the university at Algiers.

PRODUCTION. Agriculture and stock raising are the main occupations. In 1931 there were 15,172,000 acres of cultivated land in the coastal valleys and plains, 11,522,000 acres of meadow and pasture, 1,223,000 acres of trees and shrubs, and 9,478,000 acres of forests. Livestock (1932) included 893,000 cattle, 5,269,000 sheep, 2,743,000

goats, 86,000 swine, 168,000 horses, 489,000 mules and asses, and 201,000 camels. Agricultural production in 1932 (1000 units, bushels except as specified) was: Wheat, 29,236; barley, 30,902; oats, 8707; potatoes 3307; wine (gallons), 483,826; olive oil (gallons, 1932-33 season), 5042; tobacco (pounds) 40,663; dates (pounds), 340,481 in 1931. The mineral output (1932), in metric tons, was: Iron ore, 467,000; iron pyrites, 21,660; zinc ore, 3675; lead ore, 4149; coal, 22,310; petroleum, 891; phosphates, 572,000.

COMMERCE. Algerian imports in 1932 were valued at 4,253,200,000 francs (\$166,726,000 converted at par of \$0.0392), compared with 4,871,500,000 francs (\$190,964,000) in 1931. Exports totaled 3,766,500,000 francs (\$147,645,000), as against 3,402,300,000 francs (\$133,369,000) in 1931. Leading imports (1931) were: Machinery, \$15,609,000; cotton fabrics, \$14,475,000; metal manufactures, \$13,175,000. The principal export items (1931) were: Wine, \$71,761,000; wheat, \$7,210,000; eggs, \$5,576,000; fruits and nuts (excluding dates), \$4,075,000. France took 82.9 per cent of all Algerian exports by value in 1931 and supplied 77.4 per cent of the imports.

FINANCE. The normal expenditure, including military and extraordinary expenses, exceeds Algerian revenue by about 75,000,000 francs. The budget estimates for the calendar year 1933 (excluding military and naval expenditures, provided for revenue of 1,865,326,643 francs and expenditure of 1,864,535,716 francs. The public debt on Dec. 31, 1930, amounted to 1,094,000,000 francs (\$42,885,000).

COMMUNICATIONS. Railway lines open to traffic during 1931 totaled 3023 miles and receipts were 314,200,000 francs. Highways in 1932 included: National roads, 4037 miles; mail roads, 7592 miles; secondary roads, 19,740 miles. An air-mail service connected Algiers and Marseilles, France. The net tonnage of vessels in overseas trade entering the ports in 1932 was 7,485,000 tons (8,051,000 in 1931); vessels cleared, 7,176,000 tons (7,610,000 tons in 1931).

GOVERNMENT. The central executive authority is the Governor-General. He directs all the services with the exception of the non-Moslem departments of public instruction, justice, worship, and the treasury, which are controlled by the appropriate Ministries in Paris. There is a Superior Council of elected members and high government officials and a consultative council, both of which advise the Governor-General. Southern Algeria is under military government. Governor-General in 1933, M. Jules Carde, appointed Oct. 3, 1930.

ALIENS. See IMMIGRATION.

ALL AMERICAN CANAL. See RECLAMATION.

ALLEGHENY COLLEGE. A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1933 was 574, and for the summer session 115. The faculty numbered 44 members. The productive funds of the college amounted to \$1,500,000, and the income for the year 1932-33 was \$433,982. The Reis Library contained 95,000 volumes. The library contained 225,000 volumes. President, William P. Tolley, Ph.D., DD., LL.D.

ALLEN, PERCY STAFFORD. A British educator, died at Oxford, England, June 16, 1933. Born July 7, 1869, he received his education at Clifton College and Corpus Christi College, Oxford, and

in 1896 was appointed assistant master at Magdalen College school. In 1897 he was called to the Government College at Lahore, India, as professor of history, remaining there until 1901. Elected a fellow of Merton College, Oxford, in 1908, he also served as librarian (1915-24), as sub-warden (1919-21), and as dean (1920-22). In 1913 he was curator of the Bodleian Library and from 1914 to 1925 of the Indian Institute. After 1924 he was president of Corpus Christi College. Dr. Allen distinguished himself through his studies of the Renaissance which he treated in *Selections from Erasmus* (1908, 1918) and *The Age of Erasmus* (1914). His greatest work was the letters of Erasmus (*Opus Epistolarum des. Erasmi Roterdami*, vols. i-viii) which he examined and edited during 1906-32. In recognition he received the Ph.D. degree from the Universities of Leyden and Louvain and the LL.D. degree from the Universities of Birmingham and Durham. He also published *Selections from Sir Thomas More* (1924) and *Letters of Richard Fox* (1929).

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of clubs and groups, formed in 1902 for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. By 1933 it comprised more than 290 local branches, including alliances, affiliated societies, and clubs in universities, colleges, and schools, 10 new groups having been added during the year.

Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. The official lecturers for the season 1932-33 were Louis Réau, professor of the history of sculpture at the École du Louvre, Paris, and André Allix, professor at the University of Lyons and director of the Institut des Études Rhodaniennes. The Fédération organizes all lecture tours for distinguished French travelers and French lecturers who live in America, assists in organizing courses in the French language and literature in coöperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. Its Assemblée Générale, attended by representatives of the various groups, was held in New York City, Apr. 22, 1933. The official periodicals are *L'Echo de la Fédération* and *Bulletin Officiel*.

The officers in 1933 were: President, Frank D. Pavey; general vice-president, William Nelson Cromwell; president of the executive committee, Albert Blum; treasurer, John F. Daniell; general secretary, Roger Sherman; and general lecturer, Léon Vallas. Headquarters are at 43 Cedar Street, New York City.

ALLOYS. See CHEMISTRY, INDUSTRIAL OR APPLIED under *Metals and Alloys*.

ALSACE-LORRAINE, al'zās'lôr'an'. Under German rule since the end of the Franco-Prussian War of 1870-71 these provinces were returned to France by the Versailles Treaty (June 28, 1919) to date from the Armistice of Nov. 11, 1918. Alsace-Lorraine constitutes at present the three French departments of Bas-Rhin (formerly Lower Alsace), 1848 square miles and 688,242 inhabitants; Haut-Rhin (formerly Upper Alsace) 1364 square miles and 516,726 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 693,408 inhabitants. Total area, 5605 square

miles; total population, 1931 census, 1,898,376. The only petroleum fields of commercial importance in France are in Alsace-Lorraine and there are also large iron-ore, and potash deposits.

ALTITUDE RECORDS. See AERONAUTICS.

ALUMINUM. New aluminum produced in the United States during 1933 amounted to 85,126,000 pounds valued at \$16,174,000, compared with 104,885,000 pounds valued at \$20,453,000 in 1932, according to an advance summary of the U. S. Bureau of Mines. The principal producing plant was that at Massena, N. Y., where approximately 51 per cent of the metal made in the United States in 1933 was produced. Other works are at Niagara Falls, N. Y., Alcoa, Tenn., and Badin, N. D. However, the plant at Niagara Falls was not operated in 1933.

World production of aluminum (exclusive of U.S.S.R.) in 1933 was estimated at 134,000 long tons, a decline of about 10 per cent from that of 1932 (149,000 long tons). There was a substantial reduction in production in Austria, Germany, Norway, and the United States, as shown by the accompanying table. The production in Switzerland and England, however, was about 53 and 14 per cent, respectively, greater than in 1932.

WORLD PRODUCTION OF ALUMINUM, 1932-1933, BY COUNTRIES (EXCLUSIVE OF U. S. S. R.), IN LONG TONS

Country	1932	1933 *
Austria	2,000	900
Canada	17,500	15,900
England	10,000	11,400
France	14,800	14,100
Germany	18,700	13,500
Italy	13,201	11,800
Norway	17,506	14,700
Spain	1,000	1,000
Switzerland	8,000	12,200
United States	46,824	38,003
Total	149,000	134,000

* Preliminary.

According to published quotations, the domestic price of Alcoa commercial and mill ingot, 99 per cent plus, was 23.3 cents per pound, delivered, during the entire year 1933. The price of metallurgical ingot, 98-99 per cent, was 22.9 cents a pound during the entire year 1933.

The use of aluminum in buildings and constructions of diverse kinds was reported in 1933. Aluminum alloy shapes and plates were used in the floor system of an old bridge to reduce the dead-weight 750 tons so that the present supports would remain serviceable. The legalization of beer in 1933 created considerable demand for aluminum in brewing equipment, consisting of such items as tanks, cooler kettles, coils, and barrels, and also has increased the demand for aluminum bottle caps and labels.

In 1931 experiments were made in building Pullman cars in which aluminum was used as extensively as possible, and in the following year a light, stream-lined railway car constructed almost entirely of light, strong aluminum alloys was developed. These experiments led to the construction of a three-car, stream-lined all-aluminum train in 1933. The train weighs 80 tons, accommodates 116 passengers, and has mail and baggage compartments and a self-contained power plant. Also, a light-weight, multi-section, stream-lined train, the car bodies of which will be aluminum, is being built for elevated structures.

In the automobile industry an increasing use of aluminum in busses and trucks is reported. Aluminum corrugated sheet for the top plate floor of truck bodies and cast aluminum cylinder heads are recent developments. Aluminum beds made their appearance for the first time in 1933. Aluminum furniture has been used to some extent in semi-public buildings. Many miscellaneous articles in which aluminum was used included lawn mowers, shovels, rowboats, ice crushers, screen doors, electrical recording instruments, duck pins, snow plows, windlasses, dragline booms, lift trucks, radio towers, telescopes, pipe couplings, lettering pens, and harness hames.

AMERICAN LEGION. An organization of World War veterans, chartered by Congress in 1919. Its purpose is "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, State, and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The Legion's fifteenth national convention was held in Chicago, Ill., Oct. 2-5, 1933. There was an accredited delegate attendance of 1130, representing every State, the District of Columbia, nine other departments outside the continental limits of the United States, and four foreign posts not attached to a department—Havana (Cuba), Greece, Guam, and London. Unusual public interest was attached to the convention because of the widespread results in reduction and elimination of benefits to disabled veterans under the National Economy Act of Mar. 20, 1933, followed by the policy announced by the Legion upholding the President's effort to bring the nation out of the depths of the depression.

The most distinguished guest of the convention was President Roosevelt, whose visit received great publicity because he first announced he could not attend, then suddenly decided to do so and address the veterans. His address received national attention because he dealt with vital issues regarding the disabled. He said in part:

"There are many veterans of our wars to whom disability and sickness unconnected with war service has come. To them the Federal government owes the application of the same rule which it has laid down for the relief of other cases of involuntary want or destitution. In other words, if the individual affected can afford to pay for his own treatment he cannot call on any form of government aid. If he has not the wherewithal to take care of himself, it is first of all the duty of his community to take care of him and next the duty of his State. Only if under this circumstances his own community and his own State are unable, after reasonable effort, to care for him, then, and then only, should the Federal government offer him hospitalization and care." The national convention adopted a four-point programme on rehabilitation, and later, November 21, the national executive committee decreed that it be the first and paramount major objective of the Legion for 1933-34. The four points declared that the service-connected disabled veterans be restored to the status that existed prior to Mar. 20, 1933; that the government hospitalize veterans who are reasonably unable to hospitalize themselves; that presumptive service connected cases be restored to their status existing prior to Mar. 20, 1933; and that the government give protection to the widows and orphans of veterans.

Other outstanding mandates of the convention, and which the national executive committee included in the major legislative programme, called for the navy to be built up to the provisions allowed by the London Naval Treaty; the army to be built up from seventeenth place to a strength recommended by the War Department and consistent with the National Defense Act of 1920 as amended; and the passage of the universal draft law which would freeze prices upon declaration of war and would seek to prevent profiteering. In child welfare the major mandate called for increased aid to dependent children of veterans, declared to be necessary because of reductions of compensation and the general economic conditions.

The accomplishments for the year 1933 up to the time of the national convention were reviewed in the report of Louis Johnson, of Clarksburg, W. Va., the retiring national commander:

Rehabilitation: The passage of the National Economy Act virtually wiped out all existing legislation pertaining to veterans and threw the whole situation into a chaotic condition. The load of cases in the Washington office increased to some one hundred thousand. While the committee continued to function as an agent for the disabled veterans and dependents, there was an almost complete cessation of adjudication of claims. The committee joined with the Legion's national legislation committee in seeking to obtain regulations under the new act that would insure the best treatment possible for those affected. They were able to restore \$96,000,000 in benefits and compensation which the first regulations issued, but renounced before they became effective, had eliminated. The total money recoveries for veterans from the Washington and the field offices on claims amounted to \$3,647,765, as compared with \$7,509,126 the year before.

Child Welfare: The educational phase ranked first in the child welfare endeavors because of the limited resources of direct Legion emergency aid and with the objective of obtaining additional financial help of other agencies. The Legion child

welfare workers in the various departments worked diligently for the child labor amendment and also constituted a force on guard to prevent undue reductions in appropriations necessary to uphold existing legislation affecting the welfare of all children.

Americanism: The promotion of education through coöperation with school officials throughout the nation was the first major activity. It took a number of forms, some of which were the American Legion School Award medal, citizenship schools for foreign born, vocational guidance for boys, Flag history and etiquette, observance of patriotic days, and coöperation with the National Education Association in the observance of national education week.

The membership of the American Legion on Nov. 25, 1933, was 763,089. The national officers elected for 1933-34 were: National commander, Edward A. Hayes, Decatur, Ill.; vice-commanders, Charles R. Mabey, Salt Lake City, Utah; R. L. Gordon, Dermott, Ark.; Miguel Munoz, Puerto Rico; Edward Carruth, Herington, Kans.; and Charles F. Woolley, Providence, R. I.; chaplain, Fr. Robert J. White, Watertown, Mass.; national treasurer, Neal Grider, Indianapolis, Ind.; judge advocate, Remster Bingham, Indianapolis; national adjutant, Frank E. Samuel, Indianapolis. National headquarters are at 777 North Meridian Street, Indianapolis.

AMES, ADELBERT. An American soldier and administrator, died at Ormund, Fla., Apr. 13, 1933. Born at Rockland, Me., Oct. 31, 1835, he was graduated from the United States Military Academy in 1861 and immediately enlisted with the 5th Artillery as first lieutenant to serve in the Civil War. Wounded at the first Battle of Bull Run, he served later, with distinction, at Malvern Hill, Antietam, Fredericksburg, Chancellorsville, Gettysburg, Petersburg, and Fort Fisher and on Mar. 13, 1865, was brevetted major-general of volunteers for gallantry and meritorious service throughout the war. In April, 1866, he was mustered out of the volunteer service and on July 28 of that year was commissioned lieutenant-colonel in the regular army, being assigned to the 24th Infantry.

General Ames was provisional governor of Mississippi during the Reconstruction period (1868-70) when the State was engaged in framing its new constitution and ratifying the Fourteenth and Fifteenth Amendments. He also served during 1869-70 as commandant of the Fourth Military District which included Mississippi. Elected United States Senator from Mississippi in 1870, he resigned his seat in 1873 to accept the office of governor, to which he had been elected by popular vote. His administration, while marked by the promotion of the State's welfare, soon antagonized the white Democrats who accused him of favoritism to the newly enfranchised Negro population. There ensued a bitter race war which culminated after numerous minor conflicts in the Vicksburg riot of Dec. 7, 1874, in which 29 Negroes and several whites were killed.

Finally in 1876, after the Democratic party had secured a majority in both branches of the Legislature as a result of the November election, Ames and the other Republican executive officers were threatened with impeachment. The charge against him of an unconstitutional exercise of power was withdrawn, however, when he voluntarily resigned the gubernatorial office. He then removed to New York City and later to Tewksbury, a suburb of Lowell, Mass. His last military service was as brigadier-general during the Spanish-American War.

AMHERST COLLEGE. An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1933 approximately 780 students were enrolled. The active faculty, exclusive of administrative officers, emeriti professors, and those on leave, numbered 72. The productive assets of the college amounted to \$9,000,000, and the income for the year was \$863,000. The library contained 180,000 volumes. President, Stanley King, LL.D.

ANATOLIA, an'ä-tō'li-ä. An early Byzantine district name in western Asia Minor, now indefinitely applied to all Turkey in Asia.

ANDERSON, REAR ADMIRAL EDWIN ALEXANDER, U.S.N., RET. An American naval officer, died Sept. 23, 1933, in Wilmington, N. C., where he was born July 16, 1860. Graduated from the United States Naval Academy in 1882, he entered the Navy as an ensign in 1884 and was thereafter promoted through the grades to the rank of rear admiral in 1918. After serving on the *Marblehead* and commanding the *Sandoval* during the Spanish-American War (at which time he was advanced five numbers in rank for extraordinary heroism), he successively commanded the *Callao* (1902-03), *Don Juan de Austria* (1903), and the *Isle de Cuba* (1903), all part of the Asiatic Fleet. During 1904-05 he had charge of the naval gun factory in Washington, D. C., and then returned to sea duty as commander of the *Pennsylvania*. He also commanded the Second Torpedo Flotilla during 1906-07 and in the latter year went to Cincinnati as director of the recruiting station there. In 1908 he was detailed to the Navy Yard at Mare Island, Calif., and in 1910 assumed command of the gunboat *Yorktown*. After being attached to the Philadelphia Navy Yard during 1911-13 he became commander of the *New Hampshire* and in April, 1914, led the 2nd Regiment of Bluejackets in the seizure of Vera Cruz, Mexico, receiving the Congressional medal of honor for heroism on that occasion.

In 1916 Admiral Anderson was made superintendent of the Naval Auxiliaries and on the entry of the United States into the World War became commander of Squadron 3 of the American patrol detachment, organizing as a coöperative unit the air, surface, and submarine craft of the Atlantic Fleet. For this service he received the Distinguished Service Medal. During 1919-22 he had charge of the Navy Yard in Charleston, S. C., and for a short while in 1922 directed the European Forces with the temporary rank of vice

admiral. Prior to his retirement in 1923 he was commander-in-chief of the Asiatic Fleet.

ANDERSON, MELVILLE BEST. An American educator, died at La Jolla, Calif., June 22, 1933. Born at Kalamazoo, Mich., Mar. 28, 1851, he was educated at Cornell University and also in Europe at the Universities of Göttingen and Paris. On his return to the United States in 1877 he was appointed professor of modern languages at Butler University and four years later was called to the chair of English literature at Knox College. He successively held the professorships of literature and history at Purdue University (1886-87) and English language and literature at the State University of Iowa (1887-91), and then accepted the chair of English literature at Leland Stanford Jr. University which he occupied until his retirement as professor emeritus in 1910. For 10 years Dr. Anderson was engaged in making a translation in *tersa rima* of Dante's *Divine Comedy* (1921), and published a *Study of Dante and His Florence* (1929). In addition, he edited a volume of Bacon's *Essays* (1890) and translated from the French such works as Hugo's *William Shakespeare*, Boissier's *Mme. de Sévigné*, Caro's *George Sand*, and Sorel's *Montesquieu*.

ANDORRA, ün-dör'ri. A small state on the south slope of the eastern Pyrenees having a semi-independent existence under the joint protection of the Bishop of Urgel and France. Area, 191 square miles; population, 5231 in 1924; capital, Andorra-la-Vieja a village of about 700 inhabitants. The Andorrans who speak Catalan are governed by a council of 24 elected members, acting through a First Syndic. France and the Bishop respectively appoint the two civil judges. There is a customs union and a postal union with France.

HISTORY. One of the major political upheavals experienced since Andorra was established as an independent state in 1278 occurred during 1933. The overturn was largely due to the completion of a new highway, traversing the country from the French to the Spanish borders and opening it up to foreign influences and politics. Desirous of making a tourist centre of Andorra, the Catalan state was reported to have loaned the Andorran council 16,000 pesetas to build a casino, modernize the hotels, and improve the highways. On Apr. 8, 1933, the youths of the country, incensed at the alleged misappropriation of these funds by the council, invaded the council chambers and forced it to grant universal male suffrage. Therefore only the heads of landowning families exercised the suffrage.

On June 17 the representatives of the French President and the Spanish Bishop of Urgel ordered the dissolution of the Council for its submission to the youths. Andres Masso, leader of the revolt, who had subsequently been named official representative of the Spanish government in Andorra, was ordered exiled. The Council, supported by the aroused Andorrans, refused to resign. The French government, interested in the country for strategic reasons, sought to restore the authority of its President by declaring an embargo. This proving fruitless, 60 French gendarmes violated the country's neutrality for the first time in six and one-half centuries, on August 20, and took possession of it in the name of the co-princes. They disarmed Andorra's seven constables, its 36 citizen police, arrested six officials, and established the authority of a French agent. Under French auspices, a new election—the first

in which universal male suffrage obtained—was held on August 31. The new Council assembled on September 18 and elected as First Syndic, or President, Pere Torres, candidate of those opposing the co-princes.

Under pressure from Spain, the French gendarmes left the country in the middle of October and steps toward the reconciliation of the co-princes and their subjects made progress. A new disturbance arose toward the end of November when 1400 Spanish workmen employed on a power plant struck and defied the Andorra militia. The strike was ended after the deportation of 40 anarchist agitators.

ANGLIN, FRANCIS ALEXANDER. A Canadian jurist, died in Ottawa, Mar. 2, 1933. He was born at St. John, N. B., Apr. 2, 1865, brother of the actress, Margaret Anglin, and was educated at St. Mary's College, Montreal, and at the University of Ottawa where he was graduated in 1885. Called to the Ontario bar in 1888, he was appointed King's Counsel in 1902 and two years later senior puisne judge of the Ontario High Court, Exchange Division. In 1906 he served as a member of the commission to revise the statutes of Ontario. Appointed a judge of the Supreme Court of Canada in 1909, he served in that capacity until 1924 when he became chief justice. In 1925 he was made a member of the Imperial Privy Council. His resignation as chief justice took effect the day before his death. Justice Anglin was decorated with the Order of St. Gregory the Great in 1924 and with the Grand Cross of the same order in 1930. In addition to many legal articles in periodicals, he wrote *Limitations of Actions Against Trustees*, etc. (1900).

ANGLO-EGYPTIAN SUDAN. A British-Egyptian condominium in the Upper Nile region of Africa, south of the 22nd parallel of latitude. Area, 1,008,100 square miles; total population, 5,605,848 (approximately), including 59,908 non-natives. The chief towns are Khartoum, the capital, with 50,463 inhabitants; Omdurman, 103,669; Khartoum North and Rural District, 107,720; Wadi Halfa; Port Sudan; Merowé; Suakin. In the northern provinces for 1932 there were 813 schools (chiefly government institutions) with a total of 38,809 students. In the southern provinces there were 40 schools with 3092 students and 263 "bush" schools with 7000 students.

Cotton production for 1931-32 amounted to 995,265 kantars (kantar equals 312 lb.) of seed-cotton from 323,563 feddans (feddan equals 1.038 acres). The principal grain crops are dura (great millet) and dukhn (bulrush millet); sesame, groundnuts, wheat, maize, and barley are also grown. Livestock (1931): 2,250,000 sheep; 1,200,000 cattle; 2,000,000 goats; 22,750 horses; 1000 mules; 5000 pigs. Most of the world's supply of gum arabic comes from the Sudan and 19,452 tons valued at £E461,904 were exported in 1932.

In 1932, exclusive of transit trade and specie, imports were valued at £E2,684,000; exports, £E4,054,000 including reexports. Revenue and expenditure for 1932 were balanced at £E3,853,798. The budget for 1933 estimated revenue and expenditure to balance at £E3,722,000 (£E. averaged \$3.58 in 1932). There were 1989 miles of railway and 2326 miles of river services in operation at the end of 1932. Ships calling at Port Sudan during 1932 numbered 808 and aggregated 3,098,307 tons.

The Sudan is administered by a governor-

general appointed by Egypt with the assent of Great Britain. A governor-general's council aids the Governor-General in executive and legislative matters. The British and Egyptian flags are flown together. There are 13 provinces in the Sudan each under a governor. Governor-General, Sir G. S. Symes who was appointed to office during the latter part of 1933.

ANGOLA, ăng-ô'la, or **PORTUGUESE WEST AFRICA**. A Portuguese dependency on the west coast of Africa with a coast line about 1000 miles long extending from the Belgian Congo on the north to British South Africa on the south. Area, 486,079 square miles; population (1931), 4,181,730 including 40,000 Europeans. The chief towns are Nova Lisboa, the capital, 2500 (white) inhabitants in 1929; Benguela, 6000; Loanda, 20,000; Novo Redondo, 6000; Mossamedes, 5000. There are 70 schools for primary education, 3 for secondary education, and 106 professional schools.

The chief products are coffee, wax, sugar, maize, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products are gold, diamonds, malachite, copper, iron, petroleum, and salt. In 1931 the imports were valued at 146,966,123 angolares (80 angolares equal 100 Angolan escudos); exports, 204,310,014 angolares. The ordinary budget for 1932-33 balanced at 142,960,000 angolares and the extraordinary budget at 2,738,266 angolares. There were 1425 miles of railway open for traffic; 17,215 of good roads and 20,713 miles of second grade roads; 5790 miles of telegraph lines; 259 miles of telephone lines; and 19 wireless stations.

Angola is divided into 8 administrative districts and 1 Intendencia. It is governed by a high commissioner, assisted by a partly elective consultative council. The military force consists of 122 officers and 4497 other ranks. Governor and High Commissioner in 1933, Col. Eduardo F. Vianna.

ANNAM, ăn'năm'. A protectorate of France and a state of French Indo-China. King Bao-Dai is the nominal head of the government and is assisted by a Council of Ministers, but actual power rests with the French Resident-Superior. In 1926 a Chamber of Representatives with limited powers was established. Resident-Superior in 1933, A. E. LeFol. See FRENCH INDO-CHINA.

ANSCHLUSS. See GERMANY and AUSTRIA under *History*.

ANTARCTIC EXPLORATION. See POLAR RESEARCH.

ANTHROPOLOGY. The year 1933 has been relatively barren. There have been no pronouncements or discoveries of major importance, and the publication record was at low ebb. Research activities, expeditions, and publication has been drastically curtailed or wholly abandoned everywhere because of the economic depression. Some activity persisted in the United States, but that in Canada, South America, and European countries was minimal.

Fewer books and articles have been published this year than at any time in decades. This is doubly serious since the number of professional workers in anthropology has materially increased in recent years and their output available for publication correspondingly enlarged. Progress

necessarily depends on the early printing of researches, particularly in a field where so much of the record is primarily descriptive. Serious concern exists over the limited outlets for publication. For example, whereas a few years ago there were in the United States alone between forty and fifty series devoted to anthropology, to-day only sixteen are being issued and these with but a fraction of their former output. The four journals published in this country still appear regularly, but their condition is far from flourishing.

The disparity in publication possibilities in the several nations is reflected in the fields covered. Because of the relatively better position of American anthropology, contributions to North and Central American ethnography and archaeology were by far the most numerous. South America was practically without representation in the year's literature. A number of brief articles on Old World prehistory and on the tribes of Africa, Australia, and Oceania appeared, but few extended monographs. Most of this material was technical or dealt with special phases, and was, on the whole without wide significance.

The single substantial theoretical work of the year was P. Radin's *Method and Theory of Ethnology* (New York). This author attempted a critical examination of the various methods and theories underlying anthropology of the last thirty years, with particular reference to the United States. Radin insists that anthropology has no affinities with the methods or viewpoint of the natural or biological sciences. It must deal with descriptions of specific cultures, specific events, and specific individuals in the manner of the documentary historians. It has no more concern with the study of cultural processes as such than has the study of our own culture. This treatment is, however, far from objective, and a constant misapprehension of the aims of his colleagues makes the book unreliable as a history of the development of anthropological activity. While theoretical discussion may be stimulated by his work, it seems doubtful that it will itself stand as a significant contribution.

PREHISTORY AND PHYSICAL ANTHROPOLOGY. It was suggested many years ago by the late W. D. Matthew that if, as seemed probable, the mammals had evolved at a single centre, there should occur around it rings of successively differentiated genera with the least advanced types at the greatest radial distances. On the supposition that the centre lay in south central Asia, the presumption was that the whole developmental series for man might be found there. Several expeditions to inner Asia in recent years have, however, failed to find the evidence. Now A. Smith Woodward suggests on the same grounds that the early centre for man may have lain in east Africa (*Science*, Aug. 4, 39). He bases this view on the ground that both Piltown man (*Eoanthropus*) of England and Peking man (*Sinanthropus*) are archaic types of the same (Lower Pleistocene) age; that the Neanderthal races, occurring from central Europe to Palestine, represent end forms, not primitive; and that the Kanam and Kanjera remains from Kenya, East Africa, are modern types of very ancient times. *Eoanthropus* and *Sinanthropus* are looked on as the peripherally earliest forms; as for the last, it would appear that typically modern man ap-

peared much earlier in east Africa than in Europe and Asia.

This acceptance of the east African evidence is based on the report of a conference held at Cambridge, England, March 18-19. The finds made in Kenya by L. S. B. Leakey included fragments of human skeletons and crude stone implements, found in fossiliferous beds. At the conference committees were assigned to report separately on the geology, paleontology, anatomy, and archaeological problems. Their conclusions are that the human remains fall within the range of the present species of man (*Homo sapiens*); that the several types of stone implements with which they were found are equivalent in type, and hence probably in age, to the Chellean (earliest Paleolithic) culture of Europe; that the remains are an original component of the strata in which found; that the contemporary animals were of Lower Pleistocene age. The assembling of committees for the solution of such problems is becoming increasingly fashionable, but it is doubtful that the method adds to the validity of the findings.

A preliminary report on other skeletal remains of east Africa, which also have some claim to antiquity, was given in the form of a book, *Oldway* (Leipzig) by their discoverer, H. Reck.

The puzzling situation respecting the *Sinanthropus* finds in the Choukoutien caves near Peiping, China, was further complicated this year. According to a press dispatch of September 21, the upper cave, which is believed to be connected with the main cave containing *Sinanthropus*, yielded fragments of a human skull of a type quite dissimilar and more evolved than *Sinanthropus*. With these were a finely shaped flint implement and a bone needle, both of advanced type. The discoverer, W. C. Pei, suggests that the deposits of the upper cave represent a late Paleolithic culture. What is their relation to the remains of Peking man is obscure.

"Traces of prehistoric man in the form of knives, scrapers, and other implements and the remains of a mammoth, whose former existence in the Himalayas has been hitherto unsuspected," were reported by H. de Terra early in the year. "The paleolithic implements and the mammoth were found in formations that had been thrown into earth folds during the upheaval of the Himalayas and indicate that prior to that time the southern Himalayas were considerably lower in altitude. The rise of the Himalayan range must have continued into historical times" (*Science*, March 24, 301).

It has long been recognized that at least one of the racial types of Europe does not fit into the classic scheme of three-fold racial division for that continent: Nordic, Alpine, and Mediterranean. This is the tall, pseudo-Armenoid type of Montenegro, the so-called Dinaric race. Reporting on a reconnaissance of physical types in Montenegro, R. W. Ehrich offers a preliminary interpretation of its racial complexities. "The long-headed, slender Mediterraneans are the oldest people in the region. These seem to have been followed by the intrusive Dinaric strain . . . which seems to bear eastern relationships. These, in turn, were probably followed by the stocky 'Alpine' group which may have come in with the Slavs. The Nordic group which mixed with the Dinarics to form the tall Hercegovinian strain may, as has been suggested for the Dinarics also, have been brought by the Romans as colonists or

as garrisons" (*Bull. Amer. School Prehistoric Research*, no. 9, 57).

OLD WORLD ETHNOGRAPHY. The principal monograph on Africa this year is R. Linton's account of *The Tanala: a Hill Tribe of Madagascar* (*Field Mus. Publ., Anthro. Series*, 22). This, the first of a projected series descriptive of Madagascar tribes, deals with the southeastern interior. The Tanala comprise a number of autonomous triblets who fall into a northern and a southern division. To this writer Tanala culture appears in many respects to be archaic from the standpoint of the island as a whole. This is more clearly the case for the northern division, the southern having been markedly affected both in material existence and social structure by the politically organized peoples to the south and east.

From west Africa there is *An Outline of Dahomean Religious Belief* by M. J. and F. S. Herskovits (*Mem. Amer. Anthr. Assn.*, 41) which brings clarity to a very confused situation. By way of general concepts, these investigators point out first that hierarchical organization of the kingdom of Dahomey is paralleled among the gods. These are viewed as sons and heirs of the Sky-God, exercising rights over various powers, not however individually but as members of minor pantheons. Of much the same importance is the ancestral cult, comprising deified ancestors and the recent dead. They link with the gods in that the supernatural ancestors of the sibs are one with the gods. There is then a dispersal of power downward from gods to living representatives. Individuals therefore are concerned primarily with particular cults; their offerings and magical charms (fetishes) being directed on the whole only to that segment of the universal pantheon with which the family is affiliated. The continuity with the gods is marked, for it is the lot of every Dahomean to become identified with the gods, his ancestors, who work for mankind's good; his descendants in turn continuing on earth the practices he leaves behind at death.

Continuation of detailed studies of the distribution of culture elements in Africa appears in Leth and Lindblom's *Two Kinds of Fishing Implements* (Stockholm, 1933). A discussion of *The Ethnology of African Sound-Instruments* (*Africa*, London, 6, 129, 277) gives some insight into types, distribution, and possible antiquity of musical apparatus in this continent. A brief set of notes on the northern Kavirondo of Kenya Colony was published by G. Lindblom (*Revista Inst. de Etnologia, Universidad Nac. de Tucumán*, Argentina, 2, 395). This deals particularly with crisis periods (birth, death, etc.) among the Kitosh.

Polynesia, which of late years has been a prolific source of ethnographic studies, is represented this year only by P. H. Buck's *Ethnology of Manihiki and Rakahanga* (*Bull. Bishop Mus.*, 99) and Ian Hogbin's *Law and Order in Polynesia* (New York). The former is primarily a description of technology in these isolated atolls of the central Pacific; the latter is a study of life of the islanders of Ontong Java (northern Solomon Islands), usually considered a Polynesian colony in Melanesia. But, while the culture is definitely Polynesian, H. L. Shapiro finds that *The Physical Characteristics of the Ontong Javanese* are neither Polynesian nor Melanesian, but approximate those of the Caroline Islanders

in western Micronesia (*Anthr. Paprs. Amer. Mus. Nat. Hist.*, 33, pt. 3).

The surprisingly rich *Archæology of the Marianas Islands* in the western Pacific was briefly described by L. M. Thompson (*Bull. Bishop Mus.*, 100).

From New Ireland in western Melanesia comes a picture of *Life in Lesu* (New York) by H. Powdermaker. Following the pattern established by the English anthropologists working in this field, only a partial ethnography was attempted; material culture and religion being ignored relatively to the treatment of social institutions. Like other Melanesian societies, this one accentuates prestige based on wealth. Wealth is important not as mere accumulation but for its utility when so distributed as to produce prestige values. This account stresses the rôle of the individual in social and economic organization, and in the minor round of life activities.

Material on the Siberian tribes appears sporadically. W. Jochelson's account of *The Yakut* (*Anth. Paprs., Amer. Mus. Nat. Hist.*, 33, pt. 2), covering field investigations made between 1884 and 1902, is a belated report of the great Jesup North Pacific Expedition. It is established that in the thirteenth century this Turkic group was in the vicinity of Lake Baikal, being forced northward by the Mongolian Buryat into the Lena and Kolyma valleys which they occupied at the period of Russian contact (seventeenth century). A set of brief notes on *The Gold Tribe, "Fishskin Tartars," of the Lower Sungari* in northern Manchuria was published by O. Latimore (*Mem., Amer. Anth. Assn.*, 40). This Tungusic tribe, historically and linguistically close to the Manchu, represents an intermediate culture group toward the level of the northeast Siberian natives. Progressive Chinafication of both tribes has gone forward for a long time: it is therefore surprising that shamanistic practices of the Gold remain nearly in pristine form.

NEW WORLD ETHNOGRAPHY. The year had its usual quota of finds purporting to relate to early man in North America. Implements were found in association with fossil animals (mammoth, musk-ox, horse, camel, bison) which became extinct in late glacial (Pleistocene) times or soon after. These were reported from Dent, Colorado, and Clovis and Carlsbad, New Mexico. Other artifacts were found in a deep sand stratum near Dalton, Nebraska. Further evidence is needed in all cases.

A case of more than ordinary consequence seems to be presented by M. R. Harrington for finds made in Gypsum cave, southern Nevada (*Southwest Museum Papers*, 8). Here in a deep, sharply descending, debris-filled cavern were found cultural remains in close association with those of several extinct animals (Pleistocene forms of horses, camels, and notably ground-sloth). Harrington noted twelve instances within the cave where artifacts were found with or under sloth bones, hair, and dung. Aside from some finds of historic Paiute and early Pueblo provenience from superficial levels, the cultural remains were darts and arrows, cordage, fragments of baskets, etc. which in general resemble those of the ancient Basket Maker culture of the Southwest. This investigator separates these into two cultural levels (Basket Maker and an earlier culture contemporaneous with the sloth), but the segregation is not convincing. Assuming that the evidence is conclusive that the artifacts are

as old as this fauna, and again, that these species became extinct by terminal Pleistocene times at least (which some paleontologists doubt), Harrington assigns the sloth period culture to the days of Lake Lahontan, the glacial lake of Nevada.

A closely reasoned discussion of *Contacts with America across the Pacific* by R. B. Dixon (*The American Aborigines*, Toronto, 315) gives a negative answer to the suggestion that the cultures of the American Indians were influenced by Oceanic voyagers. The importance attaching to this point is that if similarities of cultural form in the two areas are demonstrated to have resulted from historic contact rather than by convergent development, the parallelism of cultural process hitherto envisaged would have to be abandoned. Dixon's argument is four-fold: the similar traits are analogous, not homologous; they occur so randomly in both America and Oceania (mostly in Melanesia and Indonesia) that a series of voyages to widely separated points in America would have to be posited; that the known characteristics of long-distance Polynesian voyages argue against any so far as the New World; that it is unthinkable that the bulk of Polynesian culture would have made no impress on America while leaving traces of unessential traits. He considers the possibility reasonable for one case alone: a club of definitely New Zealand type said to have been taken from a Peruvian grave of pre-Inca date. But it is well to remark that the record for even this instance is open to question.

This year brought the publication of accounts from three ethnographical blind-spots of northern North America. From the Aleutian Islands there was a brief survey of the *History, Ethnology, and Anthropology of the Aleut* by W. Jochelson (*Carnegie Inst. Wash.*, 432), almost wholly a compilation from somewhat obscure Russian sources, with a few original observations. C. B. Osgood's *Ethnography of the Great Bear Lake Indians* (*Ann. Rept. National Mus. Canada*, 31) is the first reasonably full report on any of the widely scattered tribes of the Mackenzie Basin in northern Canada. As important as the ethnographic material is the classification of tribal identities in this area. An extended account of *The Sanpoil and Nespelem* of north-eastern Washington (*Univ. Wash. Publ. Anth.*, 5) by V. F. Ray provides a norm for appraising this neglected southern segment of the north-western plateaus.

In a discussion of *The Plains Culture Area in the Light of Archæology* (*Amer. Anth.*, 35, 271), W. D. Strong synthesizes the hitherto uncoordinated archaeological remains for the central Plains. Evidence is assembled for a culture with Eastern Woodland leanings in the eastern part of Nebraska, followed by historic Siouan culture. In the centre, historic Pawnee culture had an earlier phrasing which shows influences from the Southeast. In the west, an early nomadic hunting culture, associated with bison types now fossil, was followed by a potteryless culture, which in turn was followed by the buffalo hunting culture of the historic period. The evidence is that agriculture was pursued over the eastern and central sections even prior to the appearance of the agricultural Pawnee-Siouan type. It is therefore suggested that sedentary agricultural life was more typical of the early central Plains than is commonly held.

New data from the California tribes are available from four localities. R. Beals' *Ethnology of the Nisenan* (Univ. Calif. Publ. Amer. Arch. Ethn., 31, no. 6) presents the culture of a hill people in the north central part of the State. While in most respects it is of the generalized central Californian type, social organization shows the impress of influences from the south. The religious and ceremonial structure has been little affected, or at least affected only recently, by that group of observances which E. M. Loeb analyzes under the title *The Eastern Kuksu Cult* (same ser., 33, no. 2), the western forms of which were considered last year. This cult was found north of San Francisco Bay in the Coast Range and lower Sacramento valley. This author divides the cult into western and eastern phases. The former comprised "the tribal initiation (ghost dance) and kuksu cult in their archaic and typical form. In the east . . . the hesi cult arose on the Sacramento river and, by a process of incorporation, put an end to the two original separate units." Ultimately, he believes, the kuksu element was derived from Mexico, the hesi impetus from the Northwest Coast. As has been remarked in an earlier YEAR BOOK, it seems unlikely that Loeb's historical reconstruction will be generally accepted. An account of *Miwok Material Culture* (Bull. Publ. Mus. Milwaukee, 2, no. 4) by Barrett and Gifford covers for the first time in *extenso* the mode of existence of the Indians of central California. A culture of quite different type is presented in J. H. Steward's *Ethnography of the Owens Valley Paiute* (Univ. Calif. Publ. Amer. Arch. Ethn., 33, no. 3). This group on the eastern margin of California participated in the simple culture of the Great Basin tribes. Extraneous influences seem relatively rare.

The ethnographic survey of the block of Yuman tribes in southern California, the Californian peninsula, and adjacent Arizona has reached a point where there is now no large group unrepresented in the collections of field data. That on the Walapai and northern Yavapai of Arizona and on the Kiliwa of the peninsula still remains to be published. This year's contributions concern *The Cocopa* (Univ. Calif. Publ. Amer. Arch. Ethn., 31, no. 5) by E. W. Gifford and *Yuman Tribes of the Gila River* (Univ. Chicago Publ. Anth.) by L. Spier. The culture of the Yumans on the lower Colorado River appears to be duplicated in typical form among the Cocopa at the river mouth. The present account is most full on the side of material and economic life.

The Gila River Yumans were originally the Maricopa and Kavelteadom: they were joined a century ago by Halchidhoma, Kohuana, and Halyikwamai, who fled eastward under pressure of constant warfare. The general mode of life was nearly identical with that of the Cocopa and other Colorado River peoples, save that the Maricopa show appreciable influences in techniques from the Pimans to the east. Maricopa religion, however, while fundamentally the highly specialized form of the Yumans to the west, shows some generalized North American traits. Whether it therefore represents an archaic form or has been secondarily influenced by the cultures to the east remains to be demonstrated.

The southwest archaeological zone, richest north of Mexico, has been intensively cultivated for forty years, so that the succession of culture

stages in the heart of the area is now well documented. Only at this late date is attention being given systematically to its extension, attenuation, and local variation on the peripheries. A preliminary report on *Early Inhabitants of Western Utah* by J. H. Steward (Bull. Univ. Utah, 23, no. 7) gives some details of mound and house types on the northwestern margin. In the opposite quarter are cave finds from western Texas discussed by Pearce and Jackson (*Anth. Papers Univ. Texas*, 1, no. 3). Like others, these investigators report a culture that is a seeming mixture of Basket Maker type with others of later date in the Southwest. It is noteworthy that these typologically distinguishable remains occurred in the same cave levels, not stratigraphically segregated.

More centrally located, but still eccentric to the major development in the Southwest, is the imperfectly known Mimbres valley, southwestern New Mexico. Conscientious excavation of a type site by H. S. and C. B. Cosgrove (*Papers, Peabody Mus., Harvard Univ.*, 15, no. 1) shows that fully developed Mimbres culture corresponds to middle Pueblo III period of the central archaeological zone (possibly 950-1150 A.D.). Even though its life span was short, the ruins show a developmental sequence of house forms: early rectangular pit dwellings with clay-lined walls and flat roofs, followed by semi-pit forms of rubble masonry, and still later by true masonry house clusters of Pueblo type.

A very rational presentation of *The Maya Correlation Problem Today* (Amer. Anth., 35, 403) by L. Roys offers the general student some perspective on the controversies that rage among the specialists on the relation of the ancient hieroglyphic calendar of Yucatan to our Christian calendar. Far from having been established with certainty, the two correlations favored to-day (those of Spinden and Goodman) are neither above criticism.

It has long been recognized that parts of these hieroglyphic inscriptions were astronomical and numerical symbols, the values of which can be read with some certainty; as for the remainder, it is suspected that they were linguistic text. But the many attempts to demonstrate their phonetic or ideographic character have all proved abortive. A very suggestive study of *The Phonetic Value of Certain Characters in Maya Writing* (Papers, Peabody Mus., 13, no. 2) by B. L. Whorf may hold the solution. These glyphs commonly occur in the codices in connection with pictures as though they were explanatory text. Noting that the glyph elements occur in fixed order, in which certain elements are known to be names of the gods pictured, Whorf assumes certain others are verbs. Fortunately for his purpose, the Maya language makes use of monosyllabic stems, each covering a group of related actions. Assuming also that the verb refers to the action pictured, he selects the appropriate verb and gives the glyph the phonetic value of the verb. This is found to check with the list of Maya glyphs with Spanish equivalents recorded by Bishop Landa in 1565, the validity of which has often been doubted.

So much attention has been given to dated monuments in the Mayan field, that other possible approaches to outlining the picture of cultural development have been neglected. Since dated stelae were lacking in *The Ruins of Holmul, Guatemala* (Mem. Peabody Mus., 3, no. 2), Mer-

win and Vaillant were forced to use stylistic variations in pottery and architecture. This is the first site in the Mayan area to yield stratified pottery deposits.

The discovery of new ruins near Pomuch, Campeche, was announced by A. Escalona on September 19. These resemble Maya remains of southern Yucatan.

A discovery of importance in Peruvian archaeology was announced in September by J. C. Tello. A series of great ruins uncovered in the Valle de Nepeña, north of Lima, give evidence that the important archaic culture of Chavin in the Sierras is represented in the coastal area.

EXPEDITIONS AND ACTIVITIES. The Naturhistoriska Riksmuseet (Stockholm) was the recipient of collections made by S. Hedin in China and Mongolia, and those of F. Lessing from the Lolos and Shansi province, southern China. E. Manker studied the nomadic forest Lapps in Vittangi district, Sweden. The Göteborgs Museum (Gothenburg) also acquired north Chinese material from G. Montell of the Hedin expedition. An archaeological series from La Candelaria, Argentina, and ethnological collections from the Tapiete and Toba in the Chaco were made by S. Rydén. For the National Museum at Copenhagen, three excavations were carried on in Greenland: on Eskimo sites, by T. Mathiasen at Disko Bay and M. Glob in northeast Greenland; on Norse archaeology, by A. Roussell in the Godthaab district. K. Birket-Smith and F. de Laguna made archaeological and ethnological investigations among Chugach Eskimo and Eyak Indians of Prince William Sound, Alaska. A. Möller began collecting in Melanesia and Indonesia.

The Riks Ethnographische Museum at Leiden reports Josselin de Jonge engaged on a two-year expedition to the Dutch East Indies, where he has already investigated in Buru and the southwest islands. For the Ethnographical Department of the Koloniaal Instituut in Amsterdam, P. Julien has proceeded to Africa for serological studies among the Congo Pygmies and tribes of the upper Nile and Kenya. Both institutions report publications in the East Indian field.

The University Museum (Oxford) continued excavations on Pleistocene and Bronze Age sites on the Gower Peninsula, England, and near Oxford, and cooperated with the Field Museum in Mesopotamia.

The Institut d'Ethnologie (University of Paris) reports ethnological expeditions by Soustelle to the Otomi and Lacandonos of Mexico, Vellard to Paraguay, Dijour to the Mataco of Bolivia, Labouret to the Cameroons (West Africa), Cuisinier to the Malay States, Devereaux to the Moi Sedang, O'Reilly to Bougainville Island and Watelin to the Ile de Pâques.

The Berlin Museum für Völkerkunde participated in the Lessing collections from south China mentioned above and others from north China and Mongolia. Minor collections were received from South America, Mexico, and New Zealand. Its expeditions included the dispatch of Waldschmidt to Further India, Neverman to Dutch New Guinea and the New Hebrides, and Sneath to Brazil and Bolivia. The Staatliche Museum für Tier-und Völkerkunde at Dresden acquired a large collection from British New Guinea.

Like all other European institutions, the Museum für Völkerkunde in Vienna reports curtailment of all activities, and no expeditions be-

cause of low finances. During the year, however, new exhibits were made of material from New Guinea, Tierra del Fuego, Canary Islands, and central North America.

Apart from some new installation the Museum für Völkerkunde at Leipzig confined itself to publication.

The Istituto del Antropologia, University of Florence, had two expeditions in Tripolitania, north Africa. L. Cipriani measured Taureg, Tebu, and other tribesmen of Fezzan, and collected ethnological and Paleolithic specimens. A palethnological expedition was led in the same area by P. Graziosi. In Italy the Istituto carried on excavations in several prehistoric caves and continued anthropometric studies in the army.

The second psychological expedition to the Kishlaks district of Uzbekistan, central Asia, undertaken by the State Psychological Institute of Moscow and associated institutions, involves anthropological investigations since its primary aim is to establish the processes of thought under varying cultural and social conditions. The leaders of the expedition were A. Luria, K. Koffka, and P. Leventueff.

For the Australian National Research Council (Sydney), H. Thurnwald undertook an ethnological expedition to New Guinea and the Solomon Islands.

The Museu Paulista (São Paulo, Brazil), the National Museum of Canada (Ottawa), the Provincial Museum (Victoria, B. C.), and the U. S. National Museum report activities practically suspended.

In Mexico the Department de Monumentos Prehispánicos continued excavations at Teotihuacán, in Mexico City, at Chichén Itzá (Yucatan), Monte Albán (Oaxaca), Calixtlahuaca (Mexico), at Tula and Tenayuca, and in Cholula.

The Carnegie Institution of Washington continued its general scientific survey of the Maya area (Yucatan) with excavations at Chichén Itzá, Uaxactun, and in Campeche, ethnological surveys in Merida, Dzitas, and villages in Quintana Roo, linguistic work on Huastec, anthropometric studies of Maya children, and a botanical survey in Peten (Guatemala).

The University of Pennsylvania Museum furthered a series of archaeological expeditions. At Piedras Negras, Guatemala, a succession of building periods was found at three Mayan sites. In Iraq, excavations continued at Ur, Tell Billa, and Tepe Gawra pushed back into prehistoric horizons. Other excavations at Tepe Hissar, Persia, disclosed early Sasanian remains, and at Eske-Kermen on the Crimean peninsula, remains of the dolmen period.

Activities of the Bureau of American Ethnology (Washington) were financially possible during only the first half year. J. P. Harrington continued linguistic study of the Indians of southern California; W. D. Strong engaged in an investigation of the northeastern part of Spanish Honduras and the Bay Islands; F. H. H. Roberts resumed excavations in an early Pueblo site near Allantown, Arizona.

For the American Museum of Natural History (New York), M. Mead carried on ethnographic work among the natives of the Sepik River and the Aitape district, New Guinea; J. Bird made a brief trip to study the archaeology of Tierra del Fuego. The Museum of the American Indian (New York) reports local excavations in New

Jersey, at Fort Ticonderoga and Throggs Neck, New York, and on Southampton Island and Melville Peninsula, Canada.

The Field Museum of Natural History (Chicago) had one expedition in the field: P. S. Martin resumed excavation at the Lowry ruin, Ackmen, Colorado. Most of the museum's attention was given to the installation of two halls housing racial types and prehistoric cultures. The Southwest Museum (Los Angeles) reports M. R. Harrington investigating at several points in Nevada: a Basket Maker site on the Virgin River, a deposit of human remains with Pleistocene animals near Las Vegas, and directing archaeological work on a large scale in anticipation of the flooding of Moapa valley by the Boulder Dam. The University of Michigan Museum continued special investigations of ceramics under J. B. Griffin and ethnobotany under V. H. Jones.

The Bishop Museum (Honolulu) had four ethnological and linguistic expeditions. In the Polynesian field, E. G. Burrows visited Alofi and Fortuna, E. S. C. Handy investigated Hawaiian medicine and magic, J. F. Stimson legends and chants in the Tuamotots. G. MacGregor visited Rennell Island and several others in the Solomon Archipelago.

Most of the active work in ethnology in the United States was, as usual, carried on by university departments. The University of Pennsylvania concentrated on religion and ceremonials of the tribes of the northeast: F. G. Speck on Delaware-Munsee and Cayuga (Ontario and Oklahoma), G. Tantaquidgeon on Cayuga, and A. I. Hallowell on St. Francis Abenaki and Berens River Saulteaux (Quebec). The Catholic University (Washington) had J. M. Cooper and R. Flannery working among the Cree and Montagnais (James Bay, northern Canada). For Columbia University, G. Reichard continued study of the material life of the Navaho (New Mexico). Yale University has several field investigations: ethnological by W. Fenton among Seneca (New York), W. Dyk and W. W. Hill among the Navaho; linguistic by M. Swadesh among Chitimacha (Louisiana) and C. Voegelin among Shawnee (Oklahoma); archaeological by C. B. Osgood in Venezuela and Panama, and F. Rainey in Florida; musical by G. Herzog among various Indians at the Chicago Fair.

The University of Chicago conducted archaeological work in Illinois under T. Deuel and ethnological investigations by S. Tax among Menominee, Pottawatomie, and Ojibwa (Wisconsin), F. Eggan among Choctaw, Cheyenne, and Arapaho (Oklahoma), W. Gilbert among Cherokee (Oklahoma), A. Bowers among Mandan (North Dakota), M. Opler among Apache (New Mexico). R. Redfield continued social investigations in Yucatan. Linguistic studies were made by B. Haile of Navaho, C. Wisdom of Chorti (Guatemala), and M. Andrade of Huastec (Vera Cruz, Mexico).

The University of California had field studies of Yavapai (Arizona) by E. W. Gifford, Southern Paiute (Nevada-Utah) by I. Kelly, Mixe (Oaxaca, Mexico) by R. Beals, and Tlingit (Alaska) by R. L. Olson; while C. Du Bois investigated the Ghost Dance movement of California and R. H. Lowie the language of the Crow tribe (Montana).

The field training courses of the Laboratory of Anthropology (Santa Fe, New Mexico) were

under R. Linton on Wichita (Oklahoma) ethnology, H. Hoijer on Apache (Arizona) language, and F. H. H. Roberts on the archaeology of Pueblo sites in Arizona.

NECROLOGY. By the death of Walter E. Roth at Georgetown, British Guiana (April 6, aged 72), the South American field lost another important contributor of the older generation. With Nordenskiöld, von den Steinen, Im Thurn, and Farrabee, who all died within the last few years, he ranked among the pioneers of ethnographic research in that continent. Roth's investigations among the natives of the Orinoco and Amazon were made possible by his services as local magistrate and later as curator of the British Guiana Museum.

Zelia C. Nuttall died in Mexico City, April 12, aged 74. During her long residence in Mexico she was instrumental in stimulating archaeological work and was a vigorous contributor of researches in earlier years. She held honorary title at the National Museum of Mexico, Peabody Museum (Harvard), and University of California.

William H. Holmes, chief of the Bureau of American Ethnology from 1902 to 1910 and subsequently director of the National Gallery of Art, died at Royal Oak, Mich., April 20, aged 86. Attached to the Hayden Geological Survey in 1872 as an artist, his discovery of the ancient ruins of southern Colorado precipitated him into an archaeological career. He is best known for his early contributions to the archaeology of North America and Yucatan.

Paul Hambruch died in Hamburg, June 23, aged 51.

Frederick Starr, emeritus associate professor of anthropology at the University of Chicago, died in Tokyo, August 14, aged 74. Apart from extensive travels over the whole globe which resulted in minor publications, he was identified during most of his life with Japan. He was credited with a knowledge of Japanese customary behavior rivaled by no other foreigner.

The death of Knud Rasmussen (in Copenhagen, December 21, aged 54) creates a real gap in Greenland scientific life. Himself of Eskimo descent, his interest in the Eskimo led him to extensive exploration and anthropological studies in the Arctic from Greenland to Alaska. As leader of the five Thule expeditions he was responsible for most of the recent serious work on the Eskimo.

See SCULPTURE.

ANTIGUA. See LEEWARD ISLANDS, BRITISH.

ANTIOCH COLLEGE. A nonsectarian co-educational institution in Yellow Springs, O., founded by Horace Mann in 1853 and reorganized in 1920 by Arthur E. Morgan with the aim of embodying anew the educational philosophy of its first president. The number of students enrolled for the fall of 1933 was 552, of whom 334 were men and 218 women. The faculty for 1933-34 numbered 93. The productive funds of the institution amounted to \$267,414, and the operating income for the year was \$331,497. The library contained approximately 41,100 volumes. President, Arthur E. Morgan, D.Sc., D.Eng.

ANTIQUES. See ART SALES.

ANTI-SALOON LEAGUE OF AMERICA. A federation of churches and temperance organizations in the United States, whose object is the extermination of the beverage liquor traffic. It was established in 1895 by a coalition of

the anti-saloon leagues of four States and the District of Columbia. At the end of 1933 it embraced 48 State or Territorial leagues and had affiliation with 45 other national temperance organizations, as well as with the World League against Alcoholism (q.v.).

During 1933 the major effort of the league was directed toward combating the attempt to modify the National Prohibition Act so as to legalize beer and wine and toward resisting the repeal of the Eighteenth Amendment to the Constitution. The platform declarations of the Republican and Democratic parties, and the position taken by the presidential candidates in the national election of 1932, threw the influence of both party organizations in opposition to prohibition for the first time since the adoption of the amendment in 1920.

Representatives of the league submitted argument in opposition to the Collier Beer Bill to legalize 3.2 per cent beer and wine, when it was pending in the 72d Congress. In the several States the league was active in supporting candidates to the State conventions opposed to the repeal of the Eighteenth Amendment and campaigned to save State prohibition enforcement laws. Also it opposed repeal in the several State prohibition referenda held during 1933. An educational campaign against the use of alcohol was conducted among young people, and statistical and factual matter, relating to the social and economic phases of the alcohol question, was published by the American Issue Publishing Co., located at Westerville, Ohio.

The officers of the league in 1933 were: President, Bishop E. G. Richardson, Philadelphia, Pa.; secretary, S. E. Nicholson, Media, Pa.; honorary treasurer, Foster Copeland, Columbus, Ohio; treasurer, H. B. Sowers, Westerville, Ohio; general superintendent, F. Scott McBride, Washington, D. C.; director of the department of education, Ernest H. Cherrington, Washington, D. C.; attorney, Edward B. Dunford, Washington, D. C.

APPONYI, ăp'p6-nyl, ALBERT COUNT. A Hungarian statesman, died Feb. 7, 1933, in Geneva, Switzerland, where he was leader of the Hungarian delegation to the World Disarmament Conference. Son of Count Gy6ry Apponyi, chancellor of the Austro-Hungarian empire, he was born in Vienna May 29, 1846, and was educated at the Universities of Vienna and Budapest. He became a member of the Hungarian Diet in 1872, serving at first as leader of the Conservative party, and after 1878 of the National party. In 1899 he joined the Liberal party and two years later was elected president of the Chamber of Deputies. On seceding from the Liberal party in 1904 he reorganized the National party and, with his followers, joined the coalition which brought about the fall of the Tisza cabinet in 1905. From 1906 to 1910 he was Minister of Education in the compromise Wekerle cabinet. During the World War he held the same post in the Esterhazy and Wekerle cabinets, but retired in 1918 as a result of the October revolution.

Count Apponyi was leader of the Hungarian delegation to the Paris Peace Conference. Later, he took his place in the Lower House of the newly constituted Hungarian Parliament, and was chosen speaker. He was an ardent supporter of the League of Nations, representing his country at the assemblies of 1924 and 1925. Though a monarchist, he was too great a nationalist to support the movement in 1931 to place the Archduke Otto upon the throne, for he believed that, in attempting to fulfill a movement opposed by the European powers, Hungarian independence would be threatened through the necessary assistance that the nation would have to seek from Austria. He published *Æsthetics and Politics, The Artist and the Statesman* (1895); *A Brief Sketch of the Hungarian Constitution and of the Relation between Austria and Hungary* (1908); *Austria-Hungary and the War* (1915); *The American Peace and Hungary* (1919); *Hungarian Foreign Policy* (1921); *Emlékirataim, Hungarian politics from 1872 to 1922* (1922); *Memoirs* (vol. 1, 1933); *Die verfassungsrechtliche Entwicklung Ungarns*, speeches delivered in three Dutch universities (1927); and, with others, *Justice for Hungary* (1928).

AQUEDUCTS. The attention of engineers in this field continued to centre on the great works described in the 1932 YEAR BOOK—the Los Angeles, San Francisco, and Boston supplies. While a few important grants were made by the R.F.C. and the P.W.A., it was felt that federal assistance had not been effective in stimulating activity in the water supply field. In many cases, such works are not organized on the self-supporting or self-liquidating basis necessary for such grants, and the possibility of federal aid has been further complicated by the deplorable state of finances in many American cities. This is particularly true in New York, where work on the new Catskill supply is practically at a standstill.

LOS ANGELES. The expenditure on this greatest aqueduct of all time will total \$220,000,000, and the R.F.C. agreed to bid on \$40,000,000 bonds at par. The work was described in detail in THE NEW INTERNATIONAL YEAR BOOK for 1932.

SAN FRANCISCO. The famous Hetch Hetchy supply is rapidly nearing completion, the only remaining work being the last lining and completion of the 28½ mile Coast Range tunnels. This is to be finished early in 1934. The total cost of this work, long delayed and much needed for the adequate supply of San Francisco, will far exceed the original estimates. This has been due in large part to the construction of costly but temporary works which were made necessary by the extraordinary drought of 1931. (See 1931 YEAR BOOK.)

BOSTON. Interest in the extension of the Metropolitan supply into the Swift and Ware river valleys has centred on the tunneling operation which will extend the work to Quabbin Reservoir, and the cut-off wall construction for this reservoir. The contractor's bid on this work was very low but the extremely efficient tunneling methods which he has adopted, particularly in mucking, have made this a most effective operation. (See FOUNDATIONS AND TUNNELS.)

Among the smaller projects, the Capitan supply for San Diego should be noted. A loan from the R.F.C. for this work, and also for a supply for Salem, Ore., has permitted these two constructions to go forward.

Denver is in a precarious position due to lack

of water, and also of funds for construction. It is planned to secure a supply from the western slope of the mountains west of Denver and to carry it by pipe line and tunnel to the city. Some 15,000 feet of 8-foot continuous welded steel pipe is involved, and indicates the growing importance of this type of conduit. It is probable, however, that all of the available city funds will have to be used in purchasing agricultural water to meet the emergency instead of in building this new supply.

Another interesting project is that for creating a Water Project Authority to undertake a comprehensive plan for supplying the Central Valleys of California. This again illustrates the trend toward the collective solution of water supply problems and this particular project will probably develop into one of the most important works of this kind to be undertaken in the near future.

PARIS, FRANCE. Final plans for the construction of the proposed aqueduct to bring a million cubic meters of water a day to the French capital from the apparently inexhaustible supplies in the fine, deep sand of the Vals de Loire still remain to be settled. As in so many other countries, financial difficulties have held up progress and this work, so important but so great in scope, can probably be financed only through national grant.

ARABIA. The great peninsula in the southwest of Asia between the Persian Gulf and the Red Sea. Area, estimated at 1,000,000 to 1,200,000 square miles, the latter figure includes the Syrian desert and the Sinaitic Peninsula. The population is estimated at from 5,000,000 to 10,000,000 and represents all degrees of transition from the nomadic life of the Bedouin, in the interior, to the highly developed civilization of the towns. The divisions of Arabia are as follows:

KINGDOM OF SAUDI ARABIA. This kingdom is made up of the territory formerly known as the Kingdom of the Hejaz and the Nejd. Ruler in 1933, King Abdul Aziz Ibn Saud.

The Hejaz occupies the western coast of Arabia from Trans-Jordan on the north to Asir in the south. Area, about 150,000 square miles; population, about 1,500,000. Mecca, the capital and the holy city of Islam, had about 130,000 inhabitants; Medina, the site of Mohammed's tomb, 30,000; Jidda, which is the seaport for Mecca, 40,000. The chief revenue of the country is derived from the annual pilgrimage bringing large numbers of Moslem pilgrims from abroad. The oases in the mountains and valleys produce dates, honey, and a variety of fruit. Bedouin products are hides, wool, and clarified butter. Exports of the country are very small. The British gold sovereign is the basis of the currency.

The Hejaz, according to the constitution of Aug. 29, 1926 (modified in 1931 and 1932), is governed by the King acting through a Viceroy (at present his second son Emir Faisal) who lives in Mecca. There are four ministries and three departments of state as well as various advisory councils of notables and officials approved by the King, which include a consultative legislative assembly in Mecca, municipal councils in Jidda and Medina, and numerous village and tribal councils.

Nejd occupies the highland of central Arabia the area of which is indefinite. The population is estimated at about 3,000,000; Riyadh, the capital, had about 30,000 inhabitants; Hufuf,

30,000; the towns of Mubarraz, Shaqra, Anaiza, Buraida, Hail, Jauf, Sakaka, and Hauta, each had a population ranging from 10,000 to 20,000. The chief products are dates, wheat, barley, fruit, hides, wool, clarified butter, and Arab cloaks, also camels, horses, donkeys, and sheep. Annual export of camels to Syria and Egypt brings a steady revenue to the Bedouin but the export of Arab horses to Bombay has fallen off. The chief imports consist of piece-goods, tea, rice, coffee, and sugar.

The Nejd is governed in patriarchal manner by the King acting through his eldest son Emir Saud who nominally resides in Riyadh and assumes there the position of Viceroy.

During the year 1933 King Ibn Saud crushed an attempt of the Idrisi tribes to overthrow the Wahabi régime in Asir, and forced those of the malcontents not decimated into the mountains on the edge of the great deserts of the Rub el Khali.

ASIR. A province on the west coast between the Hejaz and Yemen, formerly ruled by the Idrisi dynasty but since 1930, by an agreement between Ibn Saud and the Idrisi, it has been practically annexed to the Kingdom of Saudi Arabia. Population about 1,000,000; capital, Sabaia.

YEMEN. The Inanate of Yemen is an independent Arab state on the Red Sea coast between Asir and the British Protectorate of Aden. The area is about 75,000 square miles and the population from 2,000,000 to 3,000,000. Sana', the capital, is a walled city with eight gates and has a population of about 25,000. Coffee, barley, wheat, millet, and hides are the chief products and exports. Revenues total about \$5,000,000 annually. Ruling Iman in 1933, Yahya Hamid ed-Din.

THE HADRAMAUT. A region of fertile valleys situated to the east of the Aden Protectorate. The larger part of the country owes allegiance to the Qa'aiti dynasty, the head of which at present is the Sultan of Makalla, but a rival dynasty known as the Kathiri rules a number of towns and villages inland. The whole area is under loose British protection.

OMAN. An independent state at the southeasterly corner of Arabia; under the protection of Great Britain. Area, about 82,000 square miles; population, estimated to be 500,000, mostly Arabs but there is much negro blood along the coast. Muscat, the capital, had 4300 inhabitants and the adjacent town of Matrah about 8200; the population of these two towns was composed almost exclusively of Negroes and Baluchis. Trade is chiefly from and to India. The chief products are dates, pomegranates, fresh and dried limes, and dried fish. Total exports for 1931-32 amounted to 1,707,327 rupees (rupee averaged \$0.2635 for 1932); total imports, 3,737,118 rupees. Muscat is the only port of call for steamships and 293 ships (steam, and sail) of 631,694 tons entered and cleared the port during 1931-32. Transportation inland is by pack animals. The reigning Sultan in 1933 was Seyyid Said bin Taimur.

KUWAIT. A state on the northwestern coast of the Persian Gulf stretching from Iraq in the north to Nejd in the south. Area, about 1930 square miles; population about 60,000. Kuwait, the capital, had a population of about 25,000; it is an important seaport on the Persian Gulf. Ruler in 1933, Sheik Ahmed ibn Jabir al Subah.

BAHRAIN ISLANDS. An archipelago in the Persian Gulf about 20 miles from El Hasa on the Arabian coast. The chief islands are Bahrain, 27 miles long and 10 miles wide; Muharrak; Sitra; Nebi Saleh. Total area, about 250 square miles; total population, about 120,000. The important towns are Manama, the capital, with 25,000 inhabitants; Muharrak, 20,000; Bodadja, 8000.

In 1931-32 the exports amounted to £547,896; total imports, £821,824. The islands are the centre of the pearl fishing industry of the Persian Gulf and over 15,000 divers are engaged in fishing during the summer. Boat building, date cultivation, and breeding of white donkeys, are other industries. Ruler in 1933, Sheik Hamad bin Isa al Khalifa who has treaty relations with the government of India.

For other Arab or partially Arab states, see also IRAQ, PALESTINE, TRANS-JORDAN, SYRIA, and ADEN.

The Kingdom of Saudi Arabia and the government of Iraq jointly undertook a survey during the year of the proposed motor highway from Medina in the Hejaz to Bagdad in Iraq. The highway will be about 750 miles long and will take about three or four days to traverse by automobile as compared with 35 to 40 days taken by camel caravan.

HISTORY. King Ibn Saud and his Wahabite warriors crushed another of the periodic risings of his unruly subjects early in 1933. This outbreak was staged by the Idrisi, a tribe noted for its resistance to Turkish rule, over which Ibn Saud had extended his authority by the annexation of Asir in 1930. War between Ibn Saud and the Imam Yahya of Yemen appeared to be brewing toward the end of 1933, when Ibn Saud ordered the mobilization of his army to enforce his boundary claims. The prospect of friction between Ibn Saud and the Emir Abdulla of Trans-Jordan on the north was ended with the signing on July 27, 1933, of a treaty of friendship and a protocol providing for the arbitration of disputes.

King Ibn Saud took steps during 1933 to develop his territories with foreign capital, but was careful to avoid commitments which might expose Arabia to European aggression. He secured funds from a group of Indian Moslems for the construction of a railway from Jidda, on the Red Sea, to Mecca to handle the large numbers of pilgrims who annually visit the Moslem holy city. Establishment of a government-owned bank at Jidda, with a capital of \$3,500,000, guaranteed by former Khedive Abbas Hilmi of Egypt, also was announced. In July, 1933, the Standard Oil Company of California obtained an exclusive 60-year concession to exploit petroleum resources throughout Saudi Arabia. The company agreed to advance King Ibn Saud two loans and to pay annual royalties.

ARBITRATION, INTERNATIONAL. On Jan. 23, 1933 the international tribunal in the boundary controversy between Guatemala and Honduras rendered its award in the Hall of the Americas of the Pan American Union in Washington. The final settlement of this century-old dispute brought to a close another chapter in the history of arbitration in the Americas. The boundary tribunal, created by a treaty signed at Washington on July 16, 1930, was composed of the Chief Justice of the United States, Hon. Charles Evans Hughes, who presided, and two distinguished Latin American jurists—Dr. Luis Castro Ureña

of Costa Rica, and Dr. Emilio Bello Codesido of Chile. For a summary of the proceedings of the tribunal, see the *Bulletin of the Pan American Union*, April, 1933, pp. 311-14.

THE I'M ALONE CASE. This case arising out of the capture and sinking of a Canadian vessel by the United States Coast Guard (see 1930 YEAR BOOK) slowly progressed during 1933. The Commissioners, Hon. Willis Van Devanter, representing the United States and the Hon. Lyman Poore Duff, representing Canada, met at Ottawa on June 3, 1933. They filed a preliminary report and order to the effect that in compliance with a direction given Jan. 28, 1932, the agents and counsel of the high contracting parties had submitted briefs and oral argument in relation to certain preliminary questions. The Commissioners announced their answers to these questions as follows:

The first question was whether the Commissioners might enquire into the beneficial or ultimate ownership of the *I'm Alone* or of the shares of the corporation that owned the ship. If the Commissioners were authorized to make this enquiry, a further question arose as to the effect of indirect ownership and control by citizens of the United States upon the claim.

The answer was that the Commissioners thought they might enquire into the beneficial or ultimate ownership of the shares of the corporation owning the ship, as well as into the management and control of the ship and the venture in which it was engaged; and that this might be done as a basis for considering their recommendations. But the Commissioners reserved for further consideration the extent to which, if at all, the facts of such ownership, management and control might affect particular branches or phases of the claim presented.

The second question in its first aspect was whether the Government of the United States under the Convention had the right of "hot pursuit" where the offending vessel was within an hour's sailing distance of the shore at the commencement of the pursuit and beyond that distance at its termination. The question in its second aspect was whether the Government of the United States had the right of "hot pursuit" of a vessel when the pursuit commenced within the distance of 12 miles established by the revenue laws of the United States and was terminated on the high seas beyond that distance.

The answer to the first part of the question was that the Commissioners were as yet not in agreement as to the proper answer, nor had they reached a final disagreement on the matter. The Commissioners, therefore, suggested that the proceeding go forward and that the evidence be produced in an orderly way, leaving the Commissioners free to give further consideration to the matter and to announce their agreement or disagreement thereon as the case may be.

The question in its second aspect was not answered because the United States government withdrew that part of its Answer which led to the propounding of the question.

The third question was based upon the assumption that the United States government had the right of "hot pursuit" in the circumstances and was entitled to exercise the rights under Article 2 of the Convention at the time when the *Dexter* joined the *Wolcott* in the pursuit of the *I'm Alone*. The question was whether, in the circumstances, the government of the United States was legally justified in sinking the *I'm Alone*.

The answer given to this question was that on the assumptions stated the United States, might, consistently with the Convention, use necessary and reasonable force for the purpose of effecting the objects of boarding, searching, seizing, and bringing into port the suspected vessel; and if sinking should occur incidentally, as a result of the exercise of necessary and reasonable force for such purpose, the pursuing vessel might be entirely blameless. The Commissioners thought, however, in the circumstances stated in paragraph eight of the Answer, the admittedly intentional sinking of the suspected vessel was not justified by anything in the Convention.

Having thus answered the preliminary questions, the Commissioners considered the practical application of their answers to the future conduct of the case. They recommended: (1) That the agents be instructed by their respective governments to prepare and submit to the Commissioners separate statements setting forth in detail

the contentions of their respective governments as to the ultimate beneficial interests in the vessel and in the cargo, together with specifications of the documents and witnesses relied upon to substantiate their respective contentions; and (2) that the agents be similarly instructed to submit to the Commissioners either a joint statement or separate statements (in either case specifically itemized) of the sums which should be payable by the United States in case the Commissioners finally determine that compensation is payable by that government.

MIXED CLAIMS. *United States and Germany.* The aggregate amount paid to private claimants by the United States Treasury Department in accordance with the provisions of the Settlement of War Claims Act of 1928, on account of awards by the German-American Mixed Claims Commission was \$134,644,824.56, as of Mar. 31, 1933.

Of the awards to private claimants 6475 had been paid in full to the date of payment. Each of the private claimants (less than 200 in number) holding 304 awards amounting to over \$100,000 had received nine payments, in a total amount approximately equal to or more than the principal of the award; what remained to be paid represented interest. All the other claimants had been paid in full except that 40 awards to private claimants remained unpaid for the reason that proper application for such payment has not been made to the Treasury Department. These 40 awards amounted to some \$405,700 with interest.

The total cost to the United States of maintaining the Commission to June 30, 1933, was estimated at \$1,260,000. Of this amount \$645,519.51 had been actually reimbursed to the United States and covered into the Treasury as miscellaneous receipts. This was from amounts so far realized by deducting $\frac{1}{2}$ of 1 per cent from each payment made to successful claimants, as required by the aforesaid Act.

On Nov. 7, 1930, there were deposited with the Treasury Department pursuant to the Debt Agreement of June 23, 1930 between the United States and Germany, bonds of the German government (running to the government of the United States) in the total amount of Rm. 2,121,600,000 (about \$505,000,000) for the purpose of satisfying the awards of the Commission. The bonds fell due and became payable on March 31 and September 30 of each year, the last bond maturing Mar. 31, 1981. Payment of each of the four bonds which fell due on Sept. 30, 1931, Mar. 31, and Sept. 30, 1932, and Mar. 31, 1933, in the total amount of Rm. 81,600,000 (about \$19,400,000) was postponed by Germany in accordance with the option given her in the debt agreement.

There were pending to be finally submitted to the Commission some 19 claims (involving 15 different claimants). Tentative agreements for settlement of them were arrived at by the American and German agents in March, 1933. These 19 claims involved a principal amount claimed of approximately \$1,400,000, with interest from varying dates. On the basis of the tentative agreements the recoveries in these claims as of June 30, 1933, would amount to approximately \$988,000.

In addition to the foregoing there were pending two petitions for rehearing. The first, filed Apr. 17, 1933, was a marine underwriter claim involving approximately \$515,000, and the second, filed

May 4, 1933, was in the group designated as the sabotage claims.

The latter petition involved some 153 claims of 93 American nationals who suffered losses estimated at over \$23,000,000 (exclusive of interest), in the fires and explosions at Black Tom and Kingsland, N. J. These disasters occurred in 1916 and 1917, during the neutrality of the United States. They resulted in the destruction of a large amount of valuable property, including vast quantities of munitions destined for the Allies.

OTHER MIXED CLAIMS. The Mexican Foreign Office on Jan. 10, 1933, announced the settlement of Spanish claims for damages arising out of the revolutionary disorders between 1910 and 1920. Mexico was to pay damages of approximately 2.19 per cent of the original Spanish claims, which amounted to 184,100,156 pesos. (At par the peso is worth 49.846 cents). Only the claims of the United States on behalf of its nationals remained to be settled.

On Sept. 16, 1933, funds were deposited by the government of Hungary in the Hungarian Special Deposit Account in the Treasury Department of the United States which enabled that Department to pay, under the Settlement of War Claims Act of 1928, all of the awards and judgments of the Tripartite Claims Commission against Hungary, which were on said date certified to the Department by Commissioner Chandler P. Anderson, appointed Sept. 14, 1933, vice Edwin B. Parker, deceased. This concluded the work of the Commission, save for certain clerical and record work.

PERMANENT COURT OF ARBITRATION. The appointment by President Roosevelt of Prof. Manley O. Hudson of the Harvard Law School as American member of the Permanent Court of Arbitration filled a vacancy caused by the death in 1932 of Robert E. Olds, former Undersecretary of State.

ARBITRATION, LABOR. See LABOR ARBITRATION AND CONCILIATION.

ARCHAEOLOGICAL INSTITUTE OF AMERICA. A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has largely accomplished its purpose through its American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Bagdad, the School of American Research in Santa Fe, N. M., the American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Mediæval and Renaissance Studies. In 1933 it has 55 affiliated societies or chapters, with a membership of 3425. The official organ is the *American Journal of Archaeology*, a quarterly, while *Art and Archaeology*, a non-technical monthly, is published by the institute's Washington society. The officers in 1933 were: President, Louis E. Lord, Oberlin College; first vice-president, David M. Robinson, Johns Hopkins University; general secretary, Clarence Ward, Oberlin College; treasurer, Rollin H. Tanner, New York University; and recorder, Stephen B. Luce, Boston, Mass.

ARCHAEOLOGY. In the desert some 40 miles northwest of Abu-Simbel have been discovered diorite quarries containing amethystine quartz from which the Egyptians 3500 years ago obtained their amethyst. The quarries have been lost since that time. At Gizeh the University of

Cairo expedition has unearthed a pyramid near the three great pyramids. It was the burial place of Queen Khamet, who was a daughter of King Mycerinus. In the same place was also found a street which ended in a small town which seems to have been the residence of the priests of the place. Near the second pyramid was uncovered a hitherto unknown sphinx and 12 mastabas. It is interesting to note that underneath the houses of the priests was a system of tunnels which connected with the temple between the great pyramids.

Near the Great Sphinx the Egyptian University has cleared away a large space with the attendant discovery of two important tombs. One is that of Wep-m-Nefert, director of the palace and administrator of the famous vineyard planted by King Zoser. The wife of Wep-m-Nefert was Meris-Ankh, a king's daughter. In a serdab to the left of the entrance to the tomb were discovered five statues of this princess. Four were of white limestone and two stand with the left foot advanced—an unusual posture for a woman. The eyes of these figures were of crystal set in copper sockets. To the right of the entrance to the burial chamber of Wep-m-Nefert, which still remains under water, is the burial chamber of Wep-m-Nefert's son, Aba. This chamber was found to be lined with fine white limestone sculptured in part in low relief. In the chamber was found an interesting document signed by 15 witnesses which gave a certain income to this Aba. Among these witnesses were a steward, a doctor, an oculist, a builder, and a painter.

The second tomb was that of Nemaatra, the chief singer of the Pharaoh and priest of the Sun temple and the pyramid of King Neuserre. The walls of the burial chamber are covered with sculpture and painted scenes of contemporary life. To the right of this chamber is a smaller one belonging to Neferesses who was a member of the royal harem, as well as superintendent of the dancers of the king.

Next to the mastaba of Meresuanekh was excavated a shaft of another dating from the fourth dynasty. At the bottom of the shaft an opening led into a burial chamber rectangular in form and containing in the middle a sarcophagus. In the chamber were found 78 model alabaster vases and other offerings. In the sarcophagus was the body of a woman on whose head was a gold fillet. She also wore a necklace of 50 gold beads each in the shape of an insect.

West of the town of Hermopolis the Egyptian University has uncovered whole streets dating from the first century B.C. to the second A.D. Here also has been found a Græco-Egyptian temple, tombs, and two-storied houses showing fairly well-preserved wall-paintings. The lower stories of these houses were for the dead, the upper for visitors. These houses date in the fourth or fifth centuries A.D.

At Lisht the Metropolitan Museum of Art has discovered a fine large mastaba which belonged to the Chief Priest of Ptah at Memphis. On the walls were 296 columns of hieroglyphics. In front of the building was a very large chapel. Not the least interesting find at Lisht was that of a caisson used in building the shaft of the Pyramid of Se'n-Wasret I, second king of the XIIth dynasty.

At Tell el Amarna has been cleared a large complex of buildings next to the temple of the Sun. The rectangular space is about 800 by 300

yards. A ramp led up to the entrance on the west side. At the left was a pavilion with rows of columns resting on cement foundations while ahead was the House of Rejoicing which consisted of two pavilions. At the east end of these steps led into small open courts. The next division, called The Finding of Aten, was made up of open courts. In the last court, which was surrounded by chapels, was an altar. In the south part of the town were found houses of artists which contained some fine paintings.

At Megiddo in Syria the expedition of the Palestine Exploration Fund believes that it has found the stables of the cavalry of King Solomon. Here was discovered a cartouche of Sheshonk I, the Sheshak of the Bible, which is thought to show that he actually made a march against Jerusalem. Seven miles from Bethlehem in a cave have been discovered wall-carvings which go back to the Natufian period, about 12,000 B.C. These carvings represent the elephant, wild pig, rhinoceros, and gazelles. In the same cave were found evidences of a flint industry of the Clactonian period which has been dated anywhere from 100,000 to 200,000 years B.C. At Beth-zur was found a wine shop with large jars set in a rock-cut trench. To the south and west of the shop were the houses of the people who made a living out of the soldiers stationed here, for the town was a military post.

Under the direction of Dr. Herzfeld of the Oriental Institute of the University of Chicago, a stone age village dating about 4000 B.C. has been excavated near the site of Persepolis in Persia. Here also were recovered fine sculptures going back to the time of Cyrus the Great. The site of the discoveries was only 2 miles away from Persepolis. This is the best stone age village yet found. In some places the walls were 6 to 7 feet in height. The houses have the earliest known examples of windows and on the floors are the pots, fire-dogs, etc., just as they were left.

More important were the sculptures found at Persepolis on the walls of the palace of the time of Cyrus. The colonnaded halls, windows, and great doors were of a highly polished black stone. These members had been preserved by the fallen mud brick walls. The sculptures, among which are a number of important historical inscriptions, have been thus kept as fresh as when cut. If restored to their proper place these carvings would make a frieze 5½ feet in height and about 1000 feet in length. The subject represents the formal reception by the king of Persian and Median officials. The work is executed in exquisite detail as can be seen from the fact that the lynch pins of the chariots are carved to represent female figures, the legs of which act as the pin which holds the wheels in place. Although the frieze was once colored only one relief at present preserves its paint. This shows the king wearing a robe bordered with scarlet and purple and with scarlet shoes upon his feet.

The British School of Archaeology in Iraq has been engaged in work at Tell Arpachiyah in northern Mesopotamia where it was found that the latest remains, which appeared just below the surface of the ground, date no later than 4000 B.C. Here were uncovered traces of small houses with courtyards about 15 feet square surrounded by small rooms. Rarely were the walls over 8 inches in thickness. In the houses were found household utensils such as querns, pestles, flints, and knives of obsidian, together with a

few objects of copper. The burials showed that the bodies were first exposed after which the bones were gathered together and carefully arranged. Small figures of terra cotta representing the Anatolian Mother Goddess were found in the course of the digging. The pottery found in the upper part of the dig resembles that found at Ur, Kish, Erech, and Lagash while lower down it seemed to be affiliated with that of the north and Northern Syria. Not the least interesting of the finds was a series of small double axes like those of Crete.

The Field Museum this year concentrated its attention on that part of Tell Asmar where appeared the traces of the oldest culture. Excavations here in the houses revealed contacts with India as far back as 3000-2000 B.C. The houses had no central courts as at Ur, and wood was freely employed. The chief settlement belongs about 2500 B.C. at which time the Sumerians had come under the rule of the Semites of Akkad, whose king was Sargon the elder. Here was found the first representation in the round of the Sumerian type. This proved to be a small alabaster head of a man who bore a strong resemblance to the modern Bedouin.

At Tell Halaf have been found two colossal figures cut in basalt representing a male and a female deity fitted with a base to be inserted in the back of a lion and a lioness. Also were found reliefs showing hunting scenes and representations of a lion, a panther, a four-winged god, a six-winged goddess, and a warrior throwing a boomerang. At Lachish has been found a tomb with pottery of the time of Solomon, and at Khorsabad a Nabu temple in which was discovered a tablet giving a list of Assyrian kings which mentions earlier rulers than any yet known. This list also gives a complete succession down to the eighth century with some historical comments.

On the site of Troy the expedition of the University of Cincinnati, under the direction of Professor Blegen, has finished its second campaign. Here were found floors of houses of the fifth and fourth cities of Doerpfeld and Schliemann. Of some of the houses the walls were preserved, and in each room was discovered a hearth. The objects recovered include much pottery as well as objects of bronze, stone, and bone. The accumulated evidence showed the fifth city to be transitional between the early and the middle bronze age. Work on the outer part of the citadel brought to light upper courses of the sixth city, while inside the wall appeared a seventh city house. The great south gate of the city was examined and it was found that a roadway preserved in three successive layers passed through it, the earliest dating probably as far back as the time of the seventh city.

On the island of Cyprus the Swedes have been busy on the site of Enkomi, where a number of tombs have been opened. Some of the burials were of important persons as is shown by the fact that some of the garments were covered with sheets of gold and the bodies themselves wore golden mouthpieces and jewelry.

On the island of Rhodes over a thousand graves have been opened, the material from which gives a picture of the life on the island from the prehistoric days till those of Alexander. The most important finds were made at Kameiros where were found two belts of fortification, a drainage system, and public buildings.

This year the Athenian Academy has worked on the site of Plato's Academy which lies about 1500 meters from the Dipylon. Here was discovered the enclosing wall and an ancient street which led into the precinct.

The most notable work of the year in Athens has been the continued exploration of the ancient agora by the Americans under the direction of Professor Shear. The dig was made in four city blocks, the most northern of which is between Poseidon and Eponymon streets. The foundations of the east front of the Royal Stoa were uncovered. In the debris before the building were found two winged Victories one of which was fairly well preserved. A most unexpected discovery was that of Mycenaean graves containing three skeletons, fragments of vases, and a gold signet ring showing a bull-headed man leading away two women. In the second area was found a continuation of the drain which was first uncovered last year. It follows a street which at the edge of the area forks and shows that two roads here led out of the agora, one between the Acropolis and the Areopagus, and the other between the Areopagus and the Pnyx. In the fourth block at the extreme edge of the zone was found a great wall running north and south. It dates in the late third or early fourth century. The agora is honeycombed with walls both ancient and modern. In one closed about 480 B.C. were recovered 217 objects dating from the sixth to the early fifth centuries. Among the finds were six ostraka bearing the names of Hipparchos, Megacles, Hippocrates, Aristides, and Themistocles. The latter were voted in the year 483 B.C. This year much sculpture has been found including a fine head of the youthful Augustus, and one of the emperor Commodus. To date the agora collection of coins numbers 24,000.

At Corinth the Americans have found on the south side of the agora a huge building containing a large mosaic with the headless statue of a Roman orator lying on the middle of the floor. The central panel of the mosaic, which measures 31 feet by 24, shows an athlete holding a palm and standing before Eutychia. Twelve square medallions form the border.

On the Citavecchia at Ardea in Italy the Swedes have identified the temple as probably that referred to by Strabo as belonging to Venus. At Castelgandolfo on the Alban Lake in the grounds of the Villa Barberini has been found a Roman copy of a Polyclitan work identified as the Cyniscus. At Herculaneum the quarter between the fourth and fifth *cardines* has produced two fine Samnite houses, a number of shops, the temple of the Magna Mater, work places, and various industrial establishments. One large shop is more completely preserved than any at Pompeii. It contains a fireplace, an oil lamp hanging from a beam, amphoras on a shelf, and a bowl of beans on a counter. The House of the Lovers, which contained the inscription "Lovers, like bees, spend a honeyed existence," seems to have been finished just before the eruption. Work has continued at Minturno and at Lake Nemi. In the latter place have been found important ruins of the imperial period. At Populonia another splendid tumulus tomb has been found buried deep beneath the layer of iron slag waste from the ancient iron works on the island of Elba. The best tomb is in Poggio della Porcareccia and is an almost square cell something over two meters square. It is known as the tomb

of the Bronze Flabella because of the beautiful bronze fan found in it together with many other bronze objects.

At Rome the excavations have revealed the sacred area of the Zona Argentina near the border between the Campus Martius and the Circus Flaminius. In the Forum of Trajan have been discovered evidences of two important libraries. In the Forum of Cæsar a building has been uncovered on the walls of which were scratched 170 inscriptions among which appeared Vergil's epitaph "Mantua me genuit" together with lines from the *Æneid*. This may have been done by some school teacher who was holding his classes there.

At Merida in Spain a colonnade 225 feet long, of Roman date, has been brought to light. Within was a theatre and elaborate gardens. At Budapest the low state of the Danube has revealed a Roman camp on the end of a peninsula near Kalocsa. At Thunderbarrow Hill near Brighton in Sussex, England has been found a small Romano-British camp with furnaces for parching grain, grindstones, etc. At St. Albans on the site of ancient Verulamium has been uncovered a building in plan like the Flatiron Building in New York City. It is the first triangular temple found in Great Britain. See ANTHROPOLOGY.

ARCHITECTS, THE AMERICAN INSTITUTE OF. A society, founded in 1857 to unite in fellowship the architects of the United States and to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession. Its membership in 1933 numbered more than 3400 of the 7000 practicing architects in the United States.

During the year the code committee of the institute, after consulting with the 67 local chapters and the 12 State associations of architects, developed a Code of Fair Competition for Architects under the NRA programme. The institute continued also to take a leading part in the construction industry, one of its distinguished members, Stephen F. Voorhees of New York City, serving as chairman of the code committee of the Construction League, under whose auspices the General Code for the Construction Industry was developed.

The long efforts of the institute to secure recognition of the private architect in the designing of public buildings and monuments bore fruit in the announced policy of L. W. Robert, Assistant Secretary of the Treasury in Charge of Public Works, to employ private architects to design post offices and other Federal buildings coming under the jurisdiction of his department. The housing division of the Public Works Administration also fully recognized the abilities of private architects, and the attitude of the entire administration has been most sympathetic with respect to the employment of architects in private practice.

The institute cooperated with and assisted the National Park Service and the Civil Works Administration in a programme for engaging unemployed architects and architectural draftsmen during the winter of 1933-34 in measuring historic buildings in different parts of the United States. With the assistance of the presidents of the local chapters of the institute this work was organized on a regional basis.

The official organ of the society is the *Octagon*, a *Journal of the American Institute of Architects*. The officers elected at the convention held in Washington in April, 1932, continued to serve

during 1933: President, Ernest J. Russell, St. Louis, Mo.; first vice-president, Charles D. Maginnis, Boston, Mass.; second vice-president, Horace W. Peaslee, Washington, D. C.; secretary, Frank C. Baldwin, Washington, D. C.; and treasurer, Edwin Bergstrom, Los Angeles, Calif. The executive secretary is Edward C. Kemper. Headquarters are in The Octagon, 1741 New York Avenue, Washington, D. C.

ARCHITECTURE. Although the world-wide depression has caused an enormous falling off in the amount of building almost everywhere, the year has not been without architectural interest; the Chicago Century of Progress Exposition, and the Milan Triennale Exposition in Italy both revealed definite tendencies; the final selection of an architect and a design for the great Palace of the Soviets in Moscow, and the development in Germany of a strong movement toward earlier, more traditional and more romantic types of design—both were important expressions of our contemporary architectural confusions, and, to future historians, both may be seen as more significant than they may now appear. Both the Russian and the German movements are dramatic revolutions in official, if not in popular taste; behind their almost hysterical suddenness, it is possible that there lie more deep reasons than any mere caprice of a cultural autocracy.

The case of the Palace of the Soviets is perhaps the more extraordinary. After fifteen years of passionate pursuit of a revolutionary architecture of the most extreme types—expressionistic, functional,—suddenly there appeared in the official press statements that all such architectural types were "capitalistic" because they signified the slavery of man to the machine and to profits, and that a true revolutionary architecture must put man at the centre, and, at least in official buildings, be rich with sculpture, mural painting, and ornament. The statements went so far as to suggest the public architecture of the Roman empire as a proper point from which to start. The result is well shown in the published designs finally approved for the Palace of the Soviets by B. M. Iofan:—a great series of cylindrical masses with tier on tier of buttress pilasters, the whole fronted with a great composition of sweeping porticoes.

In Germany, in line with the general retrospective sentimentality of the Nazi cultured ideal, it is more natural to expect a turning aside from the sane and forward-looking attitude that characterized German architecture. Gropius, Mendelssohn, and other leaders of the movement are in practical exile. But various characteristics of the German modern movement had become too much a part of the German tradition to be given up. Banks of windows are still used freely, and the corner window where it seems appropriate; and there still is a definite underlying simplicity of functional and structural approach, coloring even such official structures as the extraordinary wooden stadium—suberly conceived and brilliantly carried out—built in Stuttgart by Paul Bonatz for the 1933 Deutsche Turnfest. On the other hand, there has been a growing distaste for flat roofs—few of the year's houses have them—and a search everywhere (probably due to the Nazi economic policy) for new ways in which to use wood. It is characteristic of this revolution in German architectural taste that *Moderne Bauformen*, formerly one of the most advanced of the architectural magazines, published this year a

number of plans and photographs of romantic American houses as examples of house types fitted to the new Germany.

Elsewhere, all over the world, the modern movement toward a new and creative architecture continues to grow, deepen, and become more and more a part of the people's tradition. The superficial style of the Chicago exposition shows this: it was not its "style" that shocked people, and sent many away vaguely unsatisfied, it was its basic lack of composition, of any apparent sense of beauty in form relationship. Moreover, whatever form composition was present, was often concealed and disintegrated by the color decoration of the whole, by the late Josef Urban, which everywhere sacrificed coherence of architecture to an erratic brilliance. Architecturally, by far the most interesting part of the exhibition was the series of small houses, built to illustrate the use of various new materials. With but one exception, these were all "modern" in type, the greater number with flat terrace roofs. The most interesting were the wooden house of "American Forest Products," by E. A. Grunsfeld, Jr., with a beautiful, well studied plan; the Rostone House, by Walter Scholer; "Design for Living" by J. C. B. Moore and Horsley and Wood; and the airy and delightful Florida tropical house, by R. L. Weed. Others gave the impression of being mere "stunts," without other significance, such as the incoherent brick house by Andrew Rebori, and the "House of Tomorrow," with its forced and impractical arrangement, by Geo. F. Keck.

The Triennale Exposition in Milan was similarly revealing of the Italian trend away from the over-heavy neo-baroque, long the "official" style, toward ideas of greater simplicity, more functionalism, and more basic (though non-archæological) classicism. The main, permanent building, by G. Muzio, in the older tradition, has no great interest in its rectangular exterior, and its projecting arched restaurant wings seem unconnected, but its great hall is beautiful in proportion, and is superbly decorated with mural paintings; especially interesting is the end wall by Chirico. The smaller buildings, on the other hand, were imaginative and fresh. The Capella dell' Arte Sacra, by A. Cassi-Ramelli had an impressive niched entrance; the Pavilion of the Press, by Baldaassare, with five great free standing simple columns, was interesting. But, as at Chicago, it was a series of small experimental houses which had the greatest architectural interest. Especially lovely was that by Moretti, Paniconi, and Pediconi, with its interesting frescoed atrium. Interesting also were the "Artist's Villa," by Pollini and Figeni; and the "Flyer's House," by Soccimarro, Zanini, and Midena, with its great windows and its interestingly arranged living-room. All of these were brilliant examples of the great variety of form composition which modern construction methods, when handled directly, simply, and sympathetically, make possible.

UNITED STATES OF AMERICA. American building totals for 1933 showed another disastrous drop for the year, the total being over 20 per cent less than the tiny total of 1932. The result, in disintegration of the building trades, and in individual hardship and destitution for architects and draftsmen, was appalling. Dodge Corporation figures showed that architects did less than one-seventh of the work that they did in 1928, which produced an unemployment situation in the profession worse than that among any similar body of men.

Even on various relief and C.W.A. works, the tremendous crush of applicants, plus the lack of any effective organization among the draftsmen, brought it about that rates of pay for draftsmen were the same as those of unskilled labor, and that to men often skilled specialists in a difficult profession. Many were graduates of professional schools of the highest quality.

The government housing schemes of the C.W.A. proved a great disappointment. Although preliminary approval was given to several schemes for slum clearance and housing in different cities, and money earmarked for them, final approval has been forthcoming only in the case of a very small number of comparative unimportance. The difficulty has not generally been architectural, but financial; tentative set-ups based on general city land values show rents too high, or the government's proposed investments too little protected; and the Washington authorities seem to have a basic objection to putting so large a proportion of total expenditure into land costs. The whole problem of slum-clearance and cheap housing is a thorny one, which is made all the more difficult because such a large amount of slum land has come, through foreclosures, into the possession of Savings Banks and Insurance Companies, whose assets could only be radically reduced by devaluing the land at great social danger. The coming year will probably see the problem clarified, as the demand for action of some kind is overwhelming.

The most important official buildings completed during the year were the Hartford, Conn., Post Office, by Malmfeldt, Adams and Prentice, in a dignified and simple modern classic; the Parcel Post Office of New York, by the supervising architect of the Treasury, distinguished only by its size; the Federal Building in Boston, by Cram and Fergusson, an incoherent sky-scraper pile in rich materials, with a purely commercial character; the St. Paul City Hall and Ramsey County Court House, by Ellerbe and Co. and Holabird and Root Associated, distinguished by its strength, its dignity, its clear directness, and its rich interiors; the large City Hall and War Memorial Building at Newton, Mass., by Allen and Collens, in a conventional Georgian manner; and an important trio of Art Museums—those at Portland, Ore., Seattle, Wash.; and the William Rockhill Nelson Art Gallery of Kansas City. The Portland Museum, by A. E. Dwight and Associates, and the Seattle Museum, by Bebb and Gould, are somewhat similar in their simple, gracious dignity, and both are designed with the simplest use of rectangular openings in simple masses; that at Seattle has its simplicity softened by a restrained use of curves in plan. The Nelson Art Gallery in Kansas City—so famous for the extraordinarily high character of its contents,—designed by Wight and Wight is much more conventional and old fashioned in its exterior aspect, with its parade of ionic columns and classic mouldings, but its composition is clear and impressive. The Coit Memorial tower on Telegraph Hill, San Francisco, by Arthur Brown, Jr., is a square shaft of 181 feet high surmounting a rectangular base of complex set-back outline.

But the most important public building of the year was not a government or municipal building; it was the great Cincinnati, O., Railroad Station, by Fellheimer and Wagner. Its superb conception was both novel and efficient, and its organization into one composition with the sta-

tion plaza by means of large quadrant wings enclosing triple traffic lines:—for busses, trolley cars, and taxis and automobiles—gave it a monumentality of composition quite unusual, yet one that grew naturally from the problem. Its great semicircular concourse leading easily into a large waiting-room over the tracks is also superb in its simplicity of form.

Little commercial building was attempted in 1933. The Metropolitan Life Insurance Co. completed a vast addition to the Home Office in New York, by D. Everitt Wade and H. W. Corbett. The Insurance Co. of North America Building, in New York, by Shreve, Lamb, and Harmon is simply and effectively detailed, and its setbacks are well composed. The Medical Arts Building, Duluth, Minn., by Erickson & Co. has well composed simple lines. The First National Bank building in New York, by Walker & Gillette, in a sort of simple neo-grec style; the People's National Bank, Tyler, Tex., by Alfred C. Finn, with strong vertical emphasis; and a Service Station at Ann Arbor, Mich., by Woodworth and Loree, because of its daring and brilliant use of enamelled iron and glass, also deserve mention.

Of industrial buildings, the Port Authority Commerce Building, New York, by Abbott Merkt & Co., is noteworthy for its large size; it is said to be, in usable floor area, the largest structure in New York. The Forest Products Laboratory, Madison, Wis., by Holabird and Root, is imaginative and expresses its functional plan in an exterior admirably massed, and distinguished with a beauty of rhythmic line not unlike the work of the German Erich Mendelsohn.

In educational and ecclesiastic work of the year, the Yale Divinity School at New Haven, Conn., by Delano and Aldrich is outstanding because of its beautiful plan and its creative handling of a late "Colonial" manner; its dignified and charming simplicity is a pleasant contrast to the blatant ostentation of many of the other recent Yale buildings. The first four new buildings of Hunter College (the New York Municipal Woman's College) in the Bronx, by Thompson, Holmes, and Converse, and Charles B. Myers, are simple and well planned. Winchton L. Risley's School at Sherman Oaks, Calif., is delightful in its direct modernity; and the Methodist Episcopal Church of Knoxville, Tenn., by Barber and McMurray and John Russell Pope associated, has a pleasant grouping around a cloistered court, and a lovely tower.

Houses of the year deserving mention include all "styles"; it is apparent that no one type holds sway in American taste. Few, save that of Rex Stout, in Fairfield County, Connecticut, by Lawrence Kocher & Gebhard Ziegler, are obviously revolutionary or even markedly "modern," but in general there is evident a gradual breaking down of hard-and-fast "stylism," and a liking for simple and direct, and rather non-romantic forms, which are significant. Houses by Verna Cook Salomonsky, in Scarsdale, N. Y. by Rowland Coate, in Beverly Hills, Calif.; by Charles S. Keefe, in New Canaan, Conn.; by Robert C. Kilbourn, in Candlewood Lake, Conn.; by John Byers, in Los Angeles, Calif.; and by James C. Mackenzie, Jr., in South Norwalk, Conn., all reveal this trend.

GREAT BRITAIN. The year's work in England again reveals and emphasizes the fact that the future of English architecture lies along revolutionary and purely modern lines. Wherever a classic style—the favored British classic of the early

century—is used, the result tends to be dry, complicated, and either incoherent or dull; wherever a new creativeness appears, the result is uniformly better, not because of its novelty, but because it possesses more sense of composition, more direct planning, and a clearer and fresher use of materials. Thus Sir Reginald Blomfield's No. 4, Carlton Gardens, London; and the Civic Hall of Leeds, by E. Vincent Harris, the two most extravagant examples of the older style, are both a little loud, a little incoherent, a little confused, despite the delicate detail of the former and the great scale of the latter. The building of No. 4 Carlton Gardens was the subject of great controversies as a great body of public opinion wished to preserve the charm and the Unity of Carlton Gardens unchanged, and town planning opinion was almost unanimous against the destruction of the old character, as the new building would inevitably destroy it. Another defeat suffered by the lovers of old London, was the final defeat by Parliament of the valiant attempts to preserve Adelphi Terrace, designed by the Adam Brothers. Parliament, however, compromised in requiring all designs for new structures there to be passed by the Crown Lands Committee, so that some uniformity may still be preserved.

Besides the Leeds Civic Hall, important town halls were erected at Stretford, by Bradshaw, Gass, and Hope; and at Preston, by Briggs and Thorneby. The former is in the usual Georgian classic; the latter in an interesting variation of Greek Revival. The enormous Masonic Peace Memorial in London, by Ashley and Norman, reveals the usual traditional classic in its most ostentatious complexity. By contrast the three Thames bridges—Chiswick, by Sir Herbert Baker; Hampton Court, by Sir Edwin Lutyens; and Twickenham, by Maxwell Ayrton—are simple, dignified, and beautiful.

The Royal Masonic Hospital, Ravenscourt Park, London, by Sir John Burnet, Tait, and Lorne, is a superb conception, entirely new and creative with a bold use of brick and beautiful cantilevered balconies. Its details, throughout, are appropriate and sensitive, and its frank use of modern materials and constructional methods welded into one aesthetic whole, makes it one of the foremost English buildings of recent years. Somewhat similarly free, and equally creative is the exquisite Midland Hotel, Morecombe, by Oliver Hill, with broad bands of openings beautifully composed in a white stucco wall, and the whole planned in a beautifully open and inviting manner. Similar in style, and almost equally interesting is the riverside restaurant at Maidenhead, the "Showboat," by Bailey and Wadham; a roadhouse at Cobham, by Clough Williams-Ellis, used inexpensive wooden construction to produce a composition of the same general character.

In commercial building, the outstanding event was the completion of the new work at the Bank of England by Sir Herbert Baker, A. T. Scott, and F. W. Troup. This work necessitated an almost complete destruction of Soane's Century-old interiors, and the development of a new plan in several stories. Soane's old screen wall around the outside was preserved; the new work above it is naturally made similar in style. But one wishes for a greater simplicity in the new work; Soane's composition is a one-story one, and any attempt to wed together old and new such as was made here by the use of colonnaded pavilions, etc. was bound to be a detriment to both. The new plan

seems direct, efficient—and at times commonplace. But one may be thankful that so much of the beautiful old interiors was salvaged, and re-used in the new work; again and again Soane's imagination and magic appear.

Universal House, Southwark, London, by Joseph Emberton is in the best spirit of free modern English work. Its simple horizontal composition, and its curved corner is effective; its use of glass spandrels between the windows recalls the "Daily Express" Building, though in the Southwark case the glass is green instead of black.

St. Saviour's, Eltham, by Welch, Cachemaille-Day, and Lander, is a beautiful and original church, showing the freshness, freedom, and charm that are so characteristic of many modern English churches. The tower is over the sanctuary, and there is in it a most interesting use of 45° planes. The arrangement of windows assures effective and dramatic lighting. Interesting also are St. Andrew's Church, Cheam, by Maxwell Ayrton, with its angular plastic ceiling and its excellent exterior, and St. Gabriel's, at Blackburn, by F. X. Velarde.

In educational buildings, the new buildings at the University of Exeter and South West England, Exeter—Mardon Hall, and the Science building, by E. Vincent Harris and S. K. Greenslade, are in a quiet and sympathetic Georgian. The new buildings for an experimental school, Dartington Hall, Ltd., at Totnes are by various architects and in various manners. It is possible that spontaneity and variety have been purchased here at too great a price of difference and disharmony. The head master's house by the American architects Howe and Lescaze is an excellent example of the so-called *International Style*; the School of the Dance-Mime, by O. P. Milne, in wood and masonry, is totally different in spirit, and the same architect's Mill and Farm Group in still a third manner. St. Anselm's School, Harrow, by Allan D. Reid, is attractively modern. The most interesting of the year's educational buildings was the new building for the architectural school of Liverpool University by C. H. Reilly, L. Briden, and J. Marshall—a beautiful, direct, and unassuming solution of the problem.

Less housing was done in England in 1933 than usual. Newquay House, Kennington Flats, London, by Louis de Soissons was characteristic of the usual open type of modern "model" tenement in London. The Liverpool flats by L. H. Keay, in Speke Road, are similar in many ways. Domestic work that warrants mention includes a group of three houses on Hyde Park West, London, by H. W. Binns and E. K. Rowe; a house at Westcott, by J. M. Simpson; and a lovely, imaginative, and entirely revolutionary house at Hornchurch, by Stewart L. Thomson.

The British Dominions. In Canada the following buildings may be noted: A new Railroad Station at Hamilton, Ontario, by Felheimer and Wagner, in a modern style with corner windows and a central tower and interesting sheet metal wainscoting within; the dignified Head office of the Hydro-Electric Company in Toronto by Chapman and Oxley and A. E. Salisbury; Upper Canada College, Toronto, by Mathers and Haldenby, in an unusually delightful version of Georgian; and the modern remodeling of the Children's Hospital, Montreal, by H. W. Davis. In general, the influence of contemporary architecture in the United States is very strong in Canada; though there is in Canadian work in general a flavor quite char-

acteristic of Canada. The most important work in Australia was the completion of the first monumental group of the University of Western Australia, at Perth, by Rodney Alsop and Conrad Sayre. It is an interesting conception carried out in a sort of cross between Italian romanesque and Renaissance; the detail is not as good as the plan and general scheme. The Shell Building, in Melbourne, by A. & K. Henderson is a 12-story office building with a simple vertical treatment on a dignified base; American influence is evident in its design.

FRANCE. The somewhat confused trends of modern French architecture seem gradually to be clarifying. There is less and less use of archaeological detail, and, too, less of the harsh rectangularity of earlier "modernist" official buildings (the Perret tradition) and less of the doctrinaire artificiality of the so-called "International" style. Plans, as usual, are almost without exception carefully studied and basically classic in conception. The Musée de la Mer, at Monte Carlo, by Hiriart, Lafaye, and Laccoureye, is typical in its suave restrained surfaces and its little touches of rich detail, such as the lovely door grilles by R. Subes. André Lurçat's Groupe Scolaire at Villejuif is the closest approach to the "international" type (except the work of LeCorbusier himself), but even in it there is a significant tendency toward a more human and less theoretical approach, and in the Groupe Scolaire Paul Doumer at Cachan, by Mathon, Chollet, and Chaussat there is achieved a graciousness of aspect that is lovely. On the other hand, the École Maternelle at Pantin, by E. Noquette, seems queerly out of date in its pseudo art-nouveau detail.

Several additions were made to the Cité Universitaire at Paris, each adding another and differing note to its extraordinary discord. The Maison des Provinces de France, by A. Guéritte is frankly art nouveau of the vintage of 1906. The Maison de Cuba, by A. Laprade, attempts the spirit of Spanish-American Baroque. The Maison des Étudiants d'Indochine, by Martin et Vieu, mixes, not too well, the horizontality of much modern work with assorted Chinese details, achieving a mere exoticism neither European nor oriental. The best of the new buildings is the Pavillon Suisse, by Le Corbusier and P. Jeanneret, brilliant in its structural conception—sunny and airy, and with an unusual freedom in its general mass composition. It has all the Le Corbusier mannerisms, but here they are subordinated to a whole conception much more serious and practical than in the greater number of his houses. The École Nationale Supérieure de Céramique at Sèvres, by Roux-Spitz, is in the older, Perret tradition, but it has a warmth and a graciousness with its classic dignity, rare in earlier work. In the École de Puériculture de la Faculté de Médecine at Paris, by Duval, Gonse, Dresse, and Oudin, the complicated programme of a modern children's hospital and medical school is integrated into a simple and direct whole, beautiful in plan and adequately expressed in a simple brick exterior. Other interesting educational buildings were the building for the outside ateliers of the École de Beaux Arts at Paris, by H. R. Expert, bold and simple, with an effective use of "strip" windows; and the American Women's Student House, Paris, by Pol Abraham, with interesting curved setbacks.

Of the churches of the year, that of Ste. Agnès

at Alfort, by de Laujardiére and Puthomme, is noteworthy because of its ingenious plan and its simple interior; its entrance tower is less successful. The church at Mitry-Mory, by M. J. Barlier, in modified Romanesque, has a good interior, but an exterior too complex; and the Chapel of Ste. Jeanne d'Arc at Gennevilliers, by M. Favier, is interesting in its use of concrete.

The best French work of the year was undoubtedly in the class of apartment houses and housing, in which there was great activity. Despite occasional over-complexities of cantilevered balconies, etc. of which, in their search for chic and interesting exteriors, the French architects are inclined to be over lavish, in general the new groups are effectively composed, planned with uncanny ingenuity, and, in exterior aspect attractive places to live. Composition is usually achieved by simple horizontal balconies, and judicious arrangements of large masses. Of the low-cost types, the Cité Chatenay-Malabry, by Arvidson, Bassompierre, de Ruté, and Sirvin, is typical of the best French recent work. Its general layout is good, and its 12-story tower is a pleasant contrast to the horizontal movement of the 4-story buildings. The housing "H.B.M." (*Habitations à bonne marché*) at Nanterre by Henri Pacon and E. Lafont, associated, is also pleasing. Of more expensive types in Paris itself, the following are outstanding: the apartment house on the Quai de Passy, by Lucas and Beaufils, with exquisitely studied plans; that at Bastion 47, Boulevard Berthier, by Bassompierre, de Ruté, and Sirvin; and that at Auteuil, by Dupuy and Thiébaud.

G. H. Pingusson's extraordinary Hotel "Latitude 43" at St. Tropez, uses long horizontal balconies around a simple sweeping curved plan beautifully, and the whole composition settles into its hillside site most harmoniously.

Private houses that deserve mention, chiefly for excellence of plan are: Jean Patou's Basque house "Berriotz," by M. L. Sue, in a kind of modernized renaissance; and a Villa at Vaucresson by C. Letrosne.

GERMANY AND AUSTRIA. The growing conservatism of German taste is well illustrated by the competition for the new Munich "Glass Palace"; the first prize design by Bohm and Feldt had as its main feature a colonnade connecting a series of small galleries. The new University buildings in Heidelberg, by K. Gruber, show the same trend in their traditional hipped roofs. In various new post office buildings in Bavaria, designed by the official post office architectural office, the new, in simple walls and grouped windows, is often charmingly combined with the traditional, in hipped roofs; the buildings fit well into their village settings. Equally effective are a series of buildings by the Oberpostdirektion of Nuremberg. The new airport at Breslau, by Behrendt and Knipping is, naturally, more modern in spirit.

Yet the traditional is not everywhere dominant. Schools, hospitals, churches, commercial, and industrial buildings are still most frequently built in the modern, non-historical spirit one has come to expect in Germany; it would seem that in these buildings, at least, Nazi culture had accepted the great creativeness of the revolutionary German past decade as an integral part of German culture, despite the fact that many of the leaders and the greatest talents in the development of that creativeness are under the Nazi ban, and largely living in foreign countries. Thus the schools at Wörsdorf-im-Taunus, by Kaufmann and Nau-

mann; and at Wuppertal-Volnwinkel, by Hollatz, Krefeld, and Schrader; the Municipal Berufsschule, at Hagen-Haspe, by G. Oberste Berghans; and the new clinical buildings of the hospital at Freiburg-im-Breisgau, are all distinctly in the modern manner. The Hagen-Haspe school is especially successful.

The greater number of new churches continue the high standard of imaginative sincerity that has been set during the last few years. The most remarkable is possibly F. Höger's superb church on the Hohenzollernplatz in Berlin, with its closely spaced concrete pointed arched trusses and its façade of brick vertical window mullions. St. Paul's Church in Altona, by Bensel, Kamps, and Amsinck, has an interesting rectangular massing. F. Schumacher's Crematorium Chapel at Hamburg has daring, inclined skylight side lighting and great parabolic arches, and the cemetery chapel at Kornwestheim, by H. Schmal, is simple, and capably done. The new church of St. Thomas, in Berlin-Charlottenburg, by P. Linder shows the influence of the brick work of F. Höger. The Evangelical Church at Wohltorf in Sachsenwald, by Bensel, Kamps, and Amsinck had a daringly bold composition of stark masses, and a rectangular tower with an interesting corner treatment. Mention should also be made of Winfried Wendland's simple and charming week-end church at Boxfelde, with its curved lamella roof. The Catholic churches at Altenheim, by A. Bosslet, and at Stuttgart-Kaltenenthal, by H. Herkomer are also freshly composed and, in general, more picturesque than the Evangelical churches. The Lillienthal Monument at Berlin-Lichterfelde, by F. Freymueller is strangely composed, but rather disturbingly effective with the great black ball surrounded by a ring shelter of flat roof supported on a single circle of thin metal columns, the whole placed on a steep conical mound.

The completion of the great Columbus House—an office building—in Berlin, by Erich Mendelsohn showed a building freely composed with his characteristic suave horizontal bandings. The new mine buildings of the Zollverein, Essen, by Schupp and Kremer, are interesting; and Hans Herkomer's great Becker Brothers' brewery at St. Ingelbert, in the Saar, is extraordinary in its perfect relationship to the town, which its great storage tower overlooks so convincingly, despite its entire modernism. The railroad station at the Wandlitzsee, by W. Wagner; and the delightful sports restaurant in the Blasewitz Forest Park, by R. E. Kolbe, with its inviting expanse of plate glass, and its spreading flat roof, also deserve mention.

The year's individual houses are endlessly varied, with a strong tendency toward the use of steep gabled or hipped roofs, and plans of distinctly American type. Such are many of the Stuttgart houses by Volkart and Trüdinger; the houses at Kikolasee and Griebnitzsee, near Berlin, by F. Schopohl; and the house at Munich—Solln, by K. A. Bernbé, but flat roofs are still used occasionally, as in P. Linder's house in Zehlendorf, and the beautifully imaginative country house near Breslau by R. Fränkel, with its inviting downstairs loggia and upstairs living terraces. This house, too, has a formality of conception rather rare in Germany. Equally interesting is Volkart and Trüdinger's, wooden week-end house at Wangen on the Bodensee.

The whole system of German housing developments seems to have finally collapsed with the coming of the Hitler government. There is still a

half-hearted attempt to produce inexpensive, rather traditional "subsistence" houses in various localities, but the sentimental agrarianism of Hitler has achieved as yet little concrete architectural expression. The most important event in the housing field was the community of 25 single houses that formed part of the Stuttgart Bau Ausstellung of 1933. They were all of wooden construction, and designed by such well known architects as R. Schmitthenner, Bonatz and Scholer, Volkart and Trüdinger, H. Eitel, and Eisenlohr and Pfennig. One of the most attractive—to American eyes—was that by Guido Görres of Berlin. This object lesson in different ways of using wood as a building material may be of great future importance in Germany.

Of the small amount of building done in Austria, one of the most interesting structures completed was a new office building in Vienna, by Theiss and Jaksch. It is an ambitious combination of a band of low shops, wings 8 stories high, and a central tower 16 stories high, with a glass observatory at the top. Important also was the delightful Wandelhalle in Bad Hall by Clemens Holzmeister, rich, elegant, and formal; the same architect's country school at Vienna-Grinzing; and the beautiful sanitarium "Subiaco" at Kremsmünster, by H. Steinender.

ITALY. In addition to the Triennale, the two most important buildings of the year were the Exposition building at Rome, in celebration of the 10th anniversary of the fascist revolution, by Libera and Valente, and the great Sports Forum Mussolini at Rome by E. del Debbio. The former was a dignified heavy structure, modern in feeling, with four great free-standing elliptical columns supporting a spreading slab porch roof. The latter was a great formal layout of stadium and gymnasium buildings, of severe neo-classic detail in stone and stucco, rather heavy-handed, but definitely monumental. There is considerable importance given to colossal statues around the stadium proper. Other noteworthy buildings are the extraordinary hotel in the Cottischen Alps, at Sestrières, consisting of a great circular tower 150 feet high, with a spiral ramp in the centre serving 11 stories of bedrooms around the outside—the rooms arranged spiral fashion themselves. This was designed by V. B. Bottina; the same architect used the same general idea again in the "Torre Balilla," at Marina di Massa. Also deserving note are Rava and Larco's Hotel at Leptis Magna, Tripoli; U. di Segni's housing in Tripoli; and the fantastic Prince of Piedmont Hotel at Sestrières, by Chevalley and Passenti.

CZECHOSLOVAKIA. The recent architecture of Czechoslovakia is more completely and thoroughly "modern" than that of almost any other country; and in its development the asceticism and rather dry functionalism of the so-called "International Style" has had almost complete sway. Thus the Municipal Bath at Brunn, by B. Fuchs, seems more like a factory on its exterior than a bath building, but it is full of ingenious planning and direct structure, and its little dressing-cabin wings are attractive. The same architect's students' dormitory in Brunn is similarly simple, direct, and harsh. J. Fragner's Chemical Factory at Prague, and electric power house at Kolin, are interesting. The new crematorium at Brunn, by Wisner, and the University at Bratislava, by K. Silinger, are different in spirit; the former dignified with a kind of fantastic dignity; the latter distinguished by its impressive simple mass com-

position. Note should also be taken of Kolator's Café and Swimming Pool at Barransov for its daring use of a beautiful and difficult site.

SCANDINAVIA. The house and museum of the sculptor Gustav Vigeland, at Oslo, by Ree and Buch, is a massive rather bleak building of great classic monumentality emphasizing its museum rather than its domestic function. The Crown Prince's summer house at Skangums, by A. Arneberg, is informal, large, and modern in type; the hotel at Sundöya, by Bjereke and Eliassen, similarly modern, has an interesting octagonal tower. Many of the recent Norwegian country houses, in wood, have a character quite similar to our own; characteristic are those in Oslo and its environs by O. Bang, by A. V. Korsmo, and by O. Scheen. In Sweden, where economic conditions have greatly reduced the total amount of published work, the present dominance of the functional types of design continues. The most important example is the royal Katharina School, at Stockholm, by Dahl and Hedqvist, with a long classroom wing, an auditorium block and a connecting stair hall; it is all airy, rectangular, and hard. Danish work, on the other hand, varies between pure functionalism and a freer, more human, less theoretical type. K. Gottlob's school at Højdevangens is characteristic of the former trend; the Dyssegaards school by Brandt, Hagen, and Schiotz,—a monumentally conceived whole—of the latter.

In Finland, there is still great building activity, and a consistent, rather classic modernism of style. The crafts school in Viborg by V. Keinänen; the Arthurinluina, Helsingfors, by M. Valikangas, and the Helsingfors Sparbank, by Frosterius and Gripenberg, are typical. The two outstanding Finnish architectural works, however, are the lovely St. Peter's Church, in Helsingfors, by T. Ryberg, that combines with the simple directness of most modern German work something of the Swedish graciousness of detail; and the daring 10 story sanitarium in Pömmar, by A. Aalto, with its superb cantilevered balconies, great sun terrace, and attractive smaller buildings. It is one of the *chefs-d'œuvre* of modern reinforced concrete construction.

SWITZERLAND. Swiss buildings demanding note are the Église Ste. Maria, Berne, by F. Dumas; the apartments at Geneva by Hoechel and Minner; the villa Bellevue, by A. Lozeron, and the great housing group of 9 story apartments around large garden courts at Mont-Choisy-deux-Parcs, Geneva, by Brailard and Vial. During the year also the exterior of the Palace of the League of Nations at Geneva was almost completed. This was a coöperative design by the chief winners of the second international competition—Nénot and Flegenhimer, Broggi, Vaccaro, Franzi, Lafèvre, and Vago. The plan developed avoided many of the faults of the competition plans; interior courts have disappeared, and the whole has been more closely integrated. There is a great formal entrance court of honor, with the assembly on the main axis, and the Council chamber and Library balancing each other on either side. The Secretarial building stretches out from the Council Chamber forming its own court, entirely open at the back, and the whole is tied together by a brilliantly studied combination of minor axes through arched vestibules. The conception is serious and monumental; the style of the exterior is impersonal, modern classic, with little historical reference, noble in scale, and rather forbidding and cold.

OTHER COUNTRIES. In Belgium the most important event was the great international competition for the development of the great area across the Scheldt in Antwerp. There was no First Prize, but 3 Second and 4 Third Prizes were awarded; also the city bought the plan of Flegenhimer, Rotival, and Winders, which arrived too late. The prize winners' plans were of all types, so that the city has not committed itself to any one type of scheme, and intends to study more carefully all, and perhaps develop an eclectic plan borrowing suggestions from many. The prize winners were Stijnen; Viret, Marmorat and Mounoyer; Fahrenkamp (with a strictly functional plan of endless rows of parallel apartments); Gutton; Cols and DeRoek; Goormans; Timpson, Turnbull, and Zeiss; and Le Corbusier. In Hungary, the interesting church at Balatboglar, by I. Kotsis; and the mountain hotel at Kekes, by L. Miskolczy, with sheltered balconies and a simple end mass, both deserve mention. In Holland, the most important building was the impressive grain elevator in the Maas harbor at Rotterdam, by Brinkmann and Van der Vlugt. South American work still oscillates erratically between overloaded baroque and art-nouveau modernism. The Municipal Fine Arts Museum at Montevideo, by E. P. Baroffio, is an exception in its quiet classic plan. In Greece a number of important new schools were built. The great school at Psychiko, by A. Kriesis, is characteristic.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A federal republic of South America, consisting of 14 Provinces, 10 Territories, and the Federal District. Capital, Buenos Aires.

AREA AND POPULATION. Argentina has an area of 1,079,965 square miles and a population estimated on Jan. 1, 1933, at 11,846,655, including about 30,000 Indians. About 30 per cent of the population is concentrated in the 10 largest cities. Buenos Aires had 2,214,702 inhabitants on Jan. 1, 1933. The other chief cities, with estimated 1932 populations, are: Rosario, 485,354; Córdoba, 253,182; La Plata, 182,401; Avellaneda, 214,512; Tucumán, 123,572; Bahía Blanca, 102,430; and Santa Fé, 125,295. In 1931 there were 77,934 marriages, 319,317 births, 137,171 deaths, 63,665 immigrants and 59,706 emigrants. The population is almost entirely of European descent, with Spanish and Italian stocks predominating.

EDUCATION. Nearly 22 per cent of the population was illiterate in 1930, compared with 35 per cent in 1916. Elementary education is free and compulsory for children from 6 to 14 years of age, funds being provided by the Federal and Provincial governments. In 1931 there were 11,552 primary schools with 1,441,348 pupils, and 473 secondary schools with 103,304 pupils. National schools numbered 4786, with 638,306 pupils. The national universities at Córdoba, Buenos Aires, La Plata, Tucumán, and Santa Fé (the latter with branches in Rosario and Corrientes), had 19,997 students in 1931.

PRODUCTION. Argentina is predominantly devoted to agriculture and livestock raising and the prosperity of these industries is entirely dependent upon the sale of their products abroad. Of the total value of exports in 1932, 66 per cent represented agricultural and 31 per cent livestock products. Of the 66,600,000 acres under cultivation in 1931, about 72 per cent was de-

voted to cereals and linseed. Argentina ranks sixth among the wheat producing countries and in 1931 was second only to the United States in corn output. It furnishes about one-half of the world's supply of linseed. The announced production of the chief crops in 1932-33, with 1931-32 figures in parentheses, was: Wheat, 235,376,000 bushels (219,594,000); corn, 263,769,000 bushels (284,831,000); oats, 69,583,000 bushels (69,280,000); and linseed, 52,305,000 bushels (89,068,000). The volume of exports in bushels of the four chief crops in 1932 was: Wheat, 126,395,000; corn, 277,740,000; oats, 49,232,000; and linseed, 79,880,000. Alfalfa, oats, potatoes, grapes, and tobacco are other crops.

The livestock census of 1930 showed 32,311,855 cattle, 44,413,221 sheep, 9,858,111 horses, 1,039,420 mules, 5,647,396 goats, and 3,768,738 swine. This gave Argentina third and fourth rank, respectively, among the sheep and cattle-raising nations of the world. Meat products, exported chiefly to the United Kingdom, accounted for 15 per cent of the 1932 exports; wool, 6 per cent; hides, 4.7 per cent. The volume of meat exports in 1932 was about 574,000 tons. The wool clip in 1932-33 was 330,700,000 pounds.

Quebracho extract is an important forest product. The leading industries are meat refrigeration and flour milling. Petroleum output in 1932 was 13,003,691 barrels, of which 5,575,146 barrels were from state-owned fields. Small quantities of gold, silver, tungsten, copper, and coal also are mined. On June 30, 1933, there were 333,997 unemployed in Argentina, according to a census by the National Department of Labor. Of these 34,548 were seasonally unemployed.

COMMERCE. The sharp decline in the value of Argentine foreign trade during the period of the world depression is shown in the accompanying table.

ARGENTINE FOREIGN TRADE
[In gold pesos worth 96.48 cents at par]

Year	Imports	Exports	Surplus of exports or imports (—)
1929	861,997,355	953,743,919	91,746,564
1930	739,182,744	614,104,180	—125,078,564
1931	516,484,457	640,558,451	124,073,994
1932	367,956,396	566,624,300	198,667,904

The value of the leading exports in 1932, converted into dollars at average exchange rates, was: Cereals and linseed, \$206,623,000; meats, \$49,700,000; wool, \$19,444,000; skins and hides, \$15,712,000; forest products, \$7,182,000; wheat flour, \$5,378,000. The chief imports in 1932 were: Textiles and textile products, \$59,802,000; fuel and lubricants, \$39,188,000; food products, \$24,602,000; iron and its manufactures, \$17,395,000; chemical products, \$15,999,000; and machinery and vehicles, \$8,811,000.

The 1933 foreign trade (in paper pesos, worth \$0.4245 gold at par) was: Imports, 897,102,000; exports, 1,120,448,000 pesos. Imports increased 5 per cent in value while exports declined 13 per cent. The United States supplied 12.7 per cent of the total imports and took 7.7 per cent of the exports.

The percentage distribution of Argentine exports by value in 1932, with 1931 figures in parentheses, was: United Kingdom, 34.5 (39.0); Netherlands, 11.1 (10.6); Belgium, 10.2 (9.3);

France, 8.9 (8.5); Germany, 8.3 (8.2); Italy, 5.3 (4.8); and United States, 3.4 (6.1). The United States ranked second to the United Kingdom as a source of Argentine imports. Imports from the United States were \$31,666,000 in 1932 (\$82,873,130 in 1931 and \$158,224,646 in 1930); exports to the United States were \$15,654,000 in 1932 (\$35,980,400 in 1931).

FINANCE. The Minister of Finance estimated a net deficit of about 30,000,000 paper pesos for the fiscal calendar year 1932. The cash revenues, income from credit operations, and cash expenditures for the years 1930, 1931, and 1932 are shown in the accompanying table prepared by the Institute of International Finance:

ARGENTINA: REVENUES AND EXPENDITURES

[In thousands of paper pesos]

	1930	1931	1932
Revenues collected	688,485	697,146	767,595
Credit operations	578,495	125,118	871,103
Total revenues ...	1,266,980	822,259	1,138,758
Cash expenditures	1,250,294	835,381	1,124,044

In the budget for 1933, total revenues were estimated at 824,797,410 paper pesos, including 91,168,839 pesos to be raised by bond issues, while expenditures were placed at 821,316,052 paper pesos, leaving a nominal surplus of 3,481,358 pesos. Provisional returns for 1933 showed receipts of 838,000,000 pesos and expenditures of 860,000,000 pesos. The deficit was 22,400,000 pesos.

The consolidated national debt on June 30, 1932, amounted to 2,729,964,000 paper pesos, of which 966,813,000 pesos represented the external debt. On Oct. 31, 1932, the floating debt was 885,600,000 paper pesos. The service of the national debt in 1932 required 286,059,000 pesos or 37 per cent of all cash revenues; in 1927, it required 147,499,000 pesos, or 20 per cent of cash revenues. The gold peso (par 96.48 cents), exchanged at an average of 66.74 cents in 1931 and 58.44 in 1932. The paper peso had a theoretical par value of 42.45 cents, United States currency, or 44 per cent of the value of the gold peso.

COMMUNICATIONS. Railways open to traffic on Sept. 30, 1932, had 24,752 miles of line, of which 5399 miles belonged to the Federal government and 19,353 miles to private companies. The 14 principal private lines reported a decline of 7 per cent in passenger traffic and of 11 per cent in freight traffic in 1932, as compared with 1931; their gross receipts were 194,685,560 gold pesos in 1932 (216,932,350 in 1931) and their expenditures were 155,370,870 gold pesos (164,838,850 in 1931). State railway receipts fell to 20,265,200 gold pesos in 1932 from 23,590,500 in 1931, or by 13 per cent. The highway mileage in 1933 was estimated at 137,177 miles, including some 2597 miles of hard-surfaced and 44,580 miles of graded and drained roads. The first of a series of national airlines, authorized by Presidential decree, was to be opened Dec. 1, 1933, between Buenos Aires and Córdoba. There were a number of other lines in operation under foreign control. During 1932, 72,138 vessels of 39,482,153 tons entered the ports and 71,448 of 39,345,983 tons cleared.

GOVERNMENT. The Constitution, as restored Feb. 16, 1932, vests executive power in a president elected for six years, and legislative power in a national congress, comprising a senate of

30 members elected for nine years by the provincial legislatures, and a chamber of deputies of 157 members elected for four years by universal suffrage. The Governors of the Provinces exercise extensive powers independently of the Federal executive. President in 1933, Gen. Augustin P. Justo, inaugurated Feb. 20, 1932; Vice President and President of the Senate, Dr. Julio A. Roca.

HISTORY

DRIFT TOWARD CLASS WARFARE. An alarming trend toward armed class strife was noted in Argentina during 1933, due chiefly to the growing violence of the Fascist *Legion Civica*. The newspapers as well as prominent individuals warned that "dark, tragic hours are approaching for the republic. . . ."

The beginning of the year found the nation still under martial law. All constitutional guarantees had been suspended since Dec. 17, 1932, when the Buenos Aires police frustrated an extensive uprising against the government by the Personalista or Irigoyen wing of the Radical party. President Justo acted with moderation, however. He made no move to suspend elections or to replace the elected provincial governors with Federal interventors. On May 2, 1933, he issued a decree terminating the "state of siege" and the following day Congress reconvened, after having been suspended since January 10. Most of the political prisoners arrested in connection with the December conspiracy were released on April 28, except former President Marcelo de Alvear and Honorio Pueyrredon, former Ambassador to the United States. Former President Hipólito Irigoyen, another alleged ringleader, was released in accordance with an order issued by the Federal courts February 23. His death on July 3, eliminating Argentina's most colorful figure from the political stage, was followed by great demonstrations of popular affection. See **IRIGOYEN, HIPÓLITO**.

While releasing the Radical conspirators, President Justo earned the hostility of the Argentine Fascists by refusing to continue the quasi-official status which their organization had enjoyed under Provisional President Uriburu. A demonstration in Buenos Aires by the *Union Civica* on May 19 was broken up by the police. Thereafter the Fascists, copying Hitler's methods in Germany, adopted more violent tactics against radical groups in an effort to preserve the conservative institutions of the republic.

On October 1, government police reported the discovery of another radical conspiracy and the arrest of some 23 ringleaders. Discovery of the plot followed the arrest of General Severo Toranzo, former Chief of the Argentine General Staff under President Irigoyen, who was charged with seeking Bolivian support for a revolt in Northern Argentina. In return, he was said to have promised to change Argentina's policy on the Chaco Dispute in Bolivia's favor. The Bolivian government was reported to have rejected the proposal. According to the police, the plot called for simultaneous outbreaks in Buenos Aires and several provinces in the interior, to be aided by non-commissioned officers in the army.

These successive conspiracies against the government greatly alarmed the conservative elements and strengthened the position of the Fascists. The activities of the latter in breaking up the political gatherings of their opponents led

to the formation of the National Civic Militia by the Radicals and of a Socialist militia called the Red Guards. The Irigoyen wing of the Radical party also established the newspaper *Viepera* in Buenos Aires to oppose the Fascist movement. Toward the end of October, the police confiscated several editions of the paper and arrested its editors for publishing diagrams and explanations showing how to make and throw bombs and hand grenades. Toward the end of the year the rapid spread of political assassinations by armed bands was reported from Buenos Aires and various provinces. Meanwhile unrest in the navy was reflected by several attempts at mutiny and other forms of insubordination. The demands of the Minister of the Navy, Admiral Pedro S. Casal, that the agitators be severely punished led to conflicts with high naval officers, who enjoyed the support of other Cabinet members. As a result, Admiral Casal resigned on November 8.

The most serious revolt staged by the Radical party since the overthrow of Irigoyen in 1930 broke out in five northeastern provinces on Dec. 29, 1933. It coincided with the termination of the party's national convention at Santa Fe. Through the support of the army and vigorous action the government checked the spread of the uprising and then defeated the main rebel forces at Santo Tome and Libres in Corrientes Province, after severe fighting. All the Radical leaders were imprisoned or exiled to Patagonia.

ECONOMIC DEVELOPMENTS. In addition to political and social strife, the roots of which lay deep in Argentine history, the government was confronted with widespread unrest due to the hardships imposed by the world economic depression. A country whose economic life was based upon the production of wheat, meats and other primary products for export, Argentina suffered acutely from the economic convulsion. The value of its foreign trade shrank from \$1,487,923,000 in 1926 to \$546,017,000 in 1932, despite the fact that the volume of cereal and linseed exports in 1932 was considerably larger than the average pre-depression shipments. The phenomenal price decline was checked to a large extent in 1933, but the demand for Argentine products abroad continued to fall off.

The drastic decline in export values, together with the restriction of foreign loans, imposed a severe strain upon the country's economic and financial structure. This was reflected in a 40 per cent decline in the exchange value of the Argentine peso. Nevertheless, the National government was one of the few Latin American administrations which continued punctually to meet service charges on the national debt. To redress the adverse balance of payments sufficiently to meet charges on the foreign debt, nearly half the country's gold stock was shipped abroad, imports were drastically curtailed, and national taxes were increased from 518,924,000 pesos in 1931 to 622,261,000 pesos in 1932.

The sacrifices entailed by the government's fiscal policy aroused increasing protests. The demand of the Minister of Finance for additional taxes to balance the 1933 budget was rejected by Congress, which reduced the proposed appropriation for debt service by 50,000,000 pesos. The Minister was authorized to reduce the service on both the foreign and domestic debt by agreement with the bondholders. During 1933 a strong movement developed in Congress for monetary inflation and for a moratorium on the

amortization service of the public debt. At the same time, farmers' and stock raisers' organizations brought strong pressure to bear for price fixing or other farm relief measures. In October, representatives of 8000 wheat growers in the Bahía Blanca region agreed not to harvest their crops unless the government fixed a minimum price at the farm covering the cost of production.

The government steadfastly opposed most of these proposals. The intention of the President to maintain full service on the public debt and to balance the budget in 1934 was announced August 18. He said there would be no increase in taxation, but that expenditure during 1934 would be cut to the level of incoming revenue. In previous years the government had attempted a small-scale agricultural price-maintenance programme, chiefly through restriction of sugar production, the regulation of grain exchanges, and the restriction of imports. It was unwilling to undertake a domestic price-fixing programme for wheat, in view of the fact that large quantities were exported. The government attempted to aid agriculture by signing the international wheat agreement in London August 25. By this agreement, signed by 20 governments, the combined exports of the four chief producing countries—Argentina, Australia, Canada, and the United States—were to be limited to 462,000,000 bushels during 1933-34. The Argentine quota was 110,000,000 bushels (see ECONOMIC CONFERENCE, WORLD). In October Congress passed a law for the construction of a series of grain elevators throughout the agricultural districts, to be operated under the direction and control of the government. The measure was intended to break the control of powerful independent grain exporters over the grain crops.

In rejecting inflation, the government was obliged to adopt the alternate course of extending and supplementing its deflationary policy. The depreciation of the United States dollar after that country abandoned the gold standard on Apr. 19, 1933, placed more serious difficulties in the way of Argentina's export trade and increased the demand for governmental action. The government responded by concluding a series of important commercial treaties and by restricting imports from countries which were selling more goods to Argentina than they purchased from her. Also a large part of the public debt was converted into bonds bearing lower interest rates.

These measures, however, proved insufficient, and on November 29 the government abandoned its deflationary policy in favor of controlled inflation. The peso, which had been artificially stabilized for two years, was "unpegged" and allowed to seek its natural level on the exchange market. It immediately depreciated 20 per cent. The monetary change was but one step in a coordinated national recovery programme which resembled in many respects that of President Roosevelt's in the United States. A Grain Regulating Board was established November 29, with authority to purchase wheat, corn, and linseed at basic prices fixed at about one-fifth higher than those obtaining on that date. The board was to sell these cereals to exporters at international market prices and to make good its losses by using the profits accruing from the difference between the buying and selling rates of foreign exchange. Other points in the plan called for the inauguration of a great public works programme and the removal of un-

employed from the cities to agricultural colonies.

THE COMMERCIAL TREATIES. Foremost among the trade treaties concluded by the government was the Anglo-Argentine agreement signed May 1, 1933, at London. This became provisionally operative for three years on that date. A supplementary tariff convention was signed in Buenos Aires September 26, the Argentine law putting it into effect being promulgated October 9. The treaty of May 1 gave Argentina practical equality with the British Dominions with regard to the export of meat products to the British market. In return British creditors of Argentina received preferential treatment in the allocation of foreign exchange by the Argentine Exchange Control Commission. It was provided that the full amount of sterling exchange arising from the sale of Argentine products in the United Kingdom, after deducting a reasonable sum annually toward the service of Argentine external debts (national, provincial and municipal), would be made available to meet current remittances from Argentina to the United Kingdom. During 1933, the equivalent of 12,000,000 paper pesos was to be segregated from the exchange made available to Great Britain under the above plan and used for the cash payment of claims held up for lack of exchange prior to May 1, 1933. The Argentine government agreed that after the exhaustion of this sum, it would issue sterling bonds, at par, bearing interest at 4 per cent and payable within 20 years, up to an amount sufficient to liquidate all remaining frozen British balances in Argentina outstanding on May 1, 1933. A protocol to the convention, among other stipulations, guaranteed fair and equitable treatment of British capital in Argentina.

By the supplementary agreement of September 26, Argentina agreed to reduce its tariff rates or official valuations on nearly 300 items of the Argentine import tariff, as well as to maintain existing duties on certain other classes of goods. In return the United Kingdom agreed not to increase its duties on meat and other Argentine natural primary products and not to impose quantitative restrictions on other specified products. According to British estimates, 70 per cent of all British exports to Argentina benefited from the tariff reductions, which in general brought Argentina's tariff rates down to the level prevailing in 1930. On November 7 a decree of the Argentine Ministry of Finance extended to all other countries the tariff reductions specified in the Anglo-Argentine treaty. However, the schedule had been drawn so as to benefit British manufacturers to a greater extent than those of other countries.

On October 19, the Minister of Finance announced that the sterling loan called for in the Anglo-Argentine agreement had been oversubscribed. The goal was £10,000,000 sterling and subscriptions totaled £13,526,335, or 171,581,423 paper pesos at the agreed exchange rate of 43 pence to the gold peso. In effect, British creditors received Argentine government bonds, bearing 4 per cent and payable in 20 years, for their peso holdings in Argentina.

Other important tariff agreements were concluded during 1933 with Italy and Chile and negotiations were opened for similar agreements with the United States and Brazil. The Italian treaty was signed in Rome, September 26. The treaty with Chile, replacing the *modus vivendi* of Nov. 12, 1932, provided that each country

should grant the other specified tariff concessions, which might be revised upon three months' notice. It was also agreed to maintain in both countries the existing ratio between paper money and gold; to maintain railway communications between the two countries; to promote construction of new transandine railways by way of So-compa and Loquimay; to facilitate the mutual exchange of merchandise; to establish facilities for the sanitary inspection of plants and animals; to prevent smuggling; to establish international drawback certificates; to sign a convention on customs regulations and the international transportation of passengers, baggage, and freight; and to grant reciprocity in consular exemptions, immunity, and privileges. The treaty was to run for three years, subject to ratification by the congresses of both countries. Ratifications were exchanged Oct. 21, 1933.

RESTRICTION OF IMPORTS. The further restriction of imports from countries with which Argentina had an unfavorable balance of trade was effected through a decree of November 10. It provided that exchange permits must be secured from the Exchange Control Commission before orders for goods could be placed abroad, and that an import license would be required for each shipment before the exchange permits would be issued. The effect of the decree was to give the Control Commission practically dictatorial powers in regulating imports.

This measure supplemented an order issued by Finance Minister Pinedo on October 18, which prohibited the remittance to any country of funds blocked previous to May 1, 1933, on the ground that such action would violate the new treaty with Great Britain. The latter measure had the effect of forcing the foreign creditors of Argentine merchants to follow the British example in exchanging the blocked peso credits for Argentine government bonds. American companies were the greatest sufferers under the exchange embargo, but it applied also to Spanish, German, French, and other foreign exporters whose payment had been delayed for lack of foreign exchange. Americans were also the principal sufferers under the import licensing scheme, as the United States had for years enjoyed a heavy favorable balance of trade with Argentina. The Exchange Control Commission took the position that since the United States purchased only 5 per cent of Argentina's exports in the first half of 1933, Americans were entitled to only 5 per cent of the available foreign exchange.

Under the pressure exerted by these moves, a number of foreign countries took steps to admit a larger proportion of Argentina's exports. In order to thaw out French, Belgian, and Swiss funds blocked in Argentina, a consortium of French, Belgian, and Swiss bankers offered the government a 20-year loan of 320,000,000 French francs at 4 per cent. Finance Minister Pinedo accepted the offer, on condition that the bankers lend as much more as might be subscribed by firms desiring to use this method to thaw out frozen credits. Approximately 100,000,000 pesos, or more than \$35,000,000, were held by American firms in blocked accounts in Argentina. They were offered the alternatives of lending these funds to the Argentine government for 15 years at 2 per cent or for 20 years at 4 per cent, the 15-year loan to take the form of Treasury notes and the 20-year loan to take the form of bonds. Before the end of 1933, a sum equivalent

MINERAL PRODUCTION. Again the output of petroleum declined, from 14,791,000 (1931), to 11,907,000 barrels (1932). The Smackover field, though yielding less as to quantity, continued to supply the main part of the State's production, of which 79 per cent came from this field (1932), as against 78 per cent for 1931.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$11,495,156 (of which \$3,021,583 was for local education); for conducting public-service enterprises, \$62,371; for interest on debt, \$7,764,275; for permanent improvements, \$19,751,133; total, \$39,072,935 (of which \$20,208,250 was for highways, \$1,770,935 being for maintenance and \$18,437,315 for construction). Revenues were \$26,157,208. Of these, property and special taxes furnished 21.0 per cent; departmental earnings and compensation to the State for officers' services, 4.2; sale of licenses, 46.4 (in which was included a gasoline sale tax that produced \$6,723,789). Funded debt outstanding on June 30, 1932, totaled \$160,480,055, of which \$135,919,888 was for highways. Net of sinking-fund assets, the debt was \$160,277,759. On an assessed valuation of \$554,834,984 the State levied in the year ad valorem taxes of \$4,827,064.

EDUCATION. According to data of the National Education Association some 400 of the rural schools of the State were unable to open for the academic year 1933-34, by reason of their lacking the means with which to meet the expenses of operation. The figure did not reveal the presumptively great number of schools that, though able to open, either had reduced the length of the period of operation for the year 1932-33 or could provide only for a shortened period of operation in the year 1933-34.

LEGISLATION. The regular session of the Legislature, convened in January, passed a number of radical anti-creditor measures. The State facing default on its debt in March, the legislators enacted the Ellis bill, providing for an issue of \$146,000,000 of 25-year 3 per cent bonds with which the State was to refund, dollar for dollar of face value, its own "full-faith-and-credit" bonds and the bonds issued by road districts, all of which bore higher rates of interest and some of which purportedly had priority of claim and were specially secured by pledge of receipts from taxes on automobiles and gasoline. The Hardin-Nance act, also passed, abolished priority of claim for certain of the old issues. Constitutional amendments were proposed to the people, to the effect that the State might issue no bonds except as approved by popular vote or for refunding purposes; and that property, excise, privilege and personal taxes might not be increased save as approved by popular vote or by vote of three-fourths of the Legislature. Revenues previously set apart for the service of a specified part of the State debt were appropriated for the service of the new refunding bonds.

The jurisdiction of courts to enforce collection of debts was suspended for 90 days. Jurisdiction of circuit and chancery courts in proceedings for foreclosure of mortgages on homesteads was suspended for two years. The issue of deficiency judgments was also suspended. It was further provided that owners might be appointed receivers for their own property. The allowed period for redeeming property sold for taxes was

extended to four years, and the rate of penalty was reduced to 3 per cent, from 10.

An old-age-pension law was enacted, appropriating \$1,500,000 a year for payments to poor persons over 70 years old, and providing special revenue from a tax of 1 per cent to be levied on all warrants presented for payment at State or county treasuries; this act was later declared unconstitutional. The State Penal Board was authorized to hire out prisoners in order to meet the cost of operating the penal system. The banking commissioner was invested with special powers of great extent to deal with the then current crisis in State banks. An election was called for July 18 to choose delegates from the 75 counties to a State convention that was to deal with the State's ratification of the proposed repeal of the Eighteenth Amendment of the Federal Constitution.

Special Session. States holding Arkansas bonds having started proceedings against the Arkansas plan for the conversion of such bonds (see above), Governor Futrell called a special session which, on August 23, appropriated \$60,000 for interest on the particular bonds held by other States. There was passed also a measure to legalize the sale of beer. The Legislature appointed a commission to discuss matters with the representatives of the holders of its bonds.

POLITICAL AND OTHER EVENTS. The State's effort (see above) to oblige its bondholders to take a refunding issue at lower interest and with loss of special priority for some of the bonds was resisted by a bondholders' committee. The States of Pennsylvania and Nevada, holding Arkansas bonds, declined to convert. An appropriation of the small sum required to pay interest on the bonds owned by other States having been made, a Federal court enjoined Arkansas officials from making the preferential payments. Pennsylvania then, in October, instituted suit in the Federal Supreme Court for an order requiring Arkansas to increase its taxes on gasoline, oil, and automobiles sufficiently to raise the \$7,500,000 a year required to meet charges on the old bond issues.

Delegates in favor of repealing the Federal Eighteenth Amendment were elected by popular vote on July 18, the popular vote running about 3 to 2 for repeal. These delegates met in State convention on August 1 and unanimously voted the State's adoption of repeal of the Eighteenth Amendment as proposed by Congress.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, J. Marion Futrell; Secretary of State, Ed. F. McDonald; Treasurer, Roy V. Leonard; Auditor, J. Oscar Humphrey; Attorney General, Hal L. Norwood; Commissioner of Education, W. E. Phipps.

Judiciary. Supreme Court: Chief Justice, C. E. Johnson; Associate Justices, Frank G. Smith, T. H. Humphreys, William F. Kirby, Thomas M. Mehaffey, and Turner Butler.

ARKANSAS, UNIVERSITY OF. A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871. It comprises the colleges of arts and sciences, education, agriculture (including experiment station), engineering (including experiment station), graduate school, and schools of law, business administration, and medicine, the last named being in Little Rock. In the fall of 1933 the enrollment was 1884 and for the summer session it was 435. The number of faculty members was 160. The endowment

amounted to \$132,000 and the income for the fiscal year ending June 30, 1933, was \$871,500. The library contained approximately 117,000 volumes. Among important gifts was one of \$5000 a year for three years, beginning January, 1931, for museum purposes from the Carnegie Foundation. Also one of \$5000 from Dr. Coulter W. Jones of Long Beach, Calif., for the establishment of a graduate scholarship in chemistry. President, John Clinton Futrall, LL.D.

ARMAMENTS, LIMITATION OF. See DISARMAMENT; NAVAL PROGRESS; MILITARY PROGRESS; GERMANY, GREAT BRITAIN, FRANCE, and ITALY under *History*.

ARMENIA. The Armenian Soviet Socialist Republic is one of the three republics constituting the Transcaucasian Socialist Federated Soviet Republic of the U.S.S.R. Bordering on Turkey and Persia about midway between the Black Sea and the Caspian Sea, Armenia had an estimated area of 11,945 square miles and a population, on Jan. 1, 1933, of 1,032,700. Erivan, the capital, had about 75,000 inhabitants (October, 1929); and Leninakan, about 43,000.

In 1929-30 the area under cultivation was about 1,000,000 acres and in 1932 over 74,000 acres were devoted to cotton. Industrial production for the year 1932 was valued at 216,700 roubles (rouble equals \$0.5146 at par in the U.S.S.R.). The schools for general education had 120,800 pupils; there are also 7 educational institutes for higher education, 48 technical schools, and 9 workers' faculties.

ARMIES. See MILITARY PROGRESS.

ARMITAGE, SIR CECIL HAMILTON. A British soldier and colonial governor, died at Rendcomb, Gloucestershire, England, Mar. 10, 1933. Born Oct. 8, 1869, he served with distinction in the Ashanti expedition of 1895-96, through whose success the kingdom of the Ashantis was made a British protectorate, and was active in 1897 in the neutral zone of the Northern Territories. In 1900 he again served in Ashanti, being Acting Resident General when during the siege of Kumasi Sir Frederic Hodgson, the governor of the Gold Coast colony, with part of the garrison succeeded in escaping to the Cape Coast and in raising a relief expedition. He was made a Companion of the Distinguished Service Order in recognition of his part in defending the fort, and told the story of the four-month siege in *The Ashanti Campaign of 1900* (1901). Following this rebellion the country, along with the Northern Territories, was definitely annexed to the Gold Coast colony. From 1910 to 1920 Sir Cecil was Chief Commissioner of the Northern Territories of the Gold Coast colony, and from 1920 to 1927 Governor and Commander-in-Chief of the Gambia colony and protectorate. He was created a Companion of St. Michael and St. George in 1911 and a Knight Commander of the Order of the British Empire in 1927.

ART EXHIBITIONS. Most important among the art exhibitions of 1933 was the great Exhibition of Paintings and Sculpture held in the Art Institute of Chicago, as a part of the Century of Progress Exposition, opening June 1 and continuing to November 1. The theme, "Century of Progress" was broadly interpreted to mean not only art of the last century but a hundred years of progress in American collecting. All but one of the more than 1200 works of art in this collection came from American sources, the one exception being "Whistler's Mother" lent by the

Louvre. Twenty-five American museums and 225 American collectors generously made loans. One hundred years ago very few great works of art were on this side of the Atlantic, but as strikingly evidenced in this exhibition, the United States now possesses treasures of amazing quality, many of which were acquired during the last 25 or 30 years,—some going at once to museums, others finding their way into private collections. One of the chief aims of the Century of Progress Exhibition was to show works which were rarely if ever seen by the public, thus emphasizing the resources of the Nation and affording the public rare opportunity and privilege. Further emphasizing the growth of art collecting in America, the statement was made that the 1200 paintings in this exhibition were assembled from a card list of no less than 30,000 items. The value of the works shown approximated \$75,000,000. It occupied 41 galleries and was arranged in definite historical sequence, covering painting from the 13th century to contemporary times—a collection of individual masterpieces, more important than any exhibition of art yet held in America. This exhibition assembled by Robert B. Harshe, Director of the Chicago Art Institute, Chauncey McCormick, Chairman of the Institute's Art Committee, and Daniel Cotton Rich, Associate Curator of Paintings, was attended by 1,538,103 persons, with the highest daily attendance amounting to 44,432.

Three lectures were given daily in Fullerton Hall, and, in addition, special guidance was provided for individuals and for groups. An elaborate catalogue was issued with carefully edited notes on each exhibit and abundant illustrations. This catalogue, which sold at \$1, was so popular that it was issued in several editions. Besides the exhibition of paintings in oil and water color, drawings and sculpture, the Art Institute set forth at the same time an important and comprehensive exhibition of prints.

In the early part of the year a notable loan exhibition of Italian paintings "from Giotto to Raphael," lent by art museums, collectors and dealers and arranged by Dr. W. R. Valentiner, was shown in the Detroit Institute of Art.

In the Palace of the Legion of Honor, San Francisco, in June, was exhibited an important loan collection of "English Art of the Eighteenth Century," assembled and arranged by Dr. Walter Heil, Director.

In the National Gallery of Art, United States National Museum, on June 23, a year and a half after the donor's death, was opened an exhibition of the John Gellatly Collection comprising 1600 art objects and 145 American paintings. Among the art objects were jewelry, glass, tapestry, needle-work, furniture, etc. To the assembling of this collection Mr. Gellatly gave many years of his life. It essentially represents the collector's taste, which was of rare discrimination and quality. The collection is valued at \$4,000,000, and although it duplicates the Freer Collection in some of the painters represented, such as Thayer, Dewing, Melchers, and one or two others, it is distinctly individual.

In the National Gallery of Art in the early part of 1933 was held an exhibition of paintings by Cesareo de Quiros of Argentina, representing Gaucho Life in Argentina, which was set forth under the patronage of the Argentine Ambassador.

A loan exhibition of paintings and sculpture owned by residents of Berkshire County, evidencing again the richness of American private

collections and the presence in American homes scattered throughout the country of works of art of rare value, was held in the Berkshire Museum, Pittsfield, Mass., from September 1 to 24.

A Memorial Exhibition of paintings, drawings and etchings by the late Gari Melchers was held in the Corcoran Gallery of Art in November-December, 1933. In this gallery, in the spring of the year, an exhibition of Indian Tribal Arts—paintings and handicrafts by contemporary American Indians—was shown, with the result that certain mural paintings by American Indians were placed in one of the Federal Buildings, that occupied by the Department of the Interior. Also, in the late autumn a significant exhibition of craft work by members of the Southern Highlands Handicraft Guild, consisting of weavings, baskets, pewter, wood-carvings, furniture, toys, etc., was held, calling attention to what might be called our native American crafts.

A comprehensive and important loan exhibition of paintings by Boldini, arranged by Mrs. Chester Dale, was held in the Wildenstein Galleries, New York, in 1933, for the benefit of Bellevue Hospital.

For the purpose of raising money for other charities an important loan exhibition of paintings by Rembrandt was held at Knoedler's in April. During the same month, moreover, three famous private collections—those of Lord Duveen, Stephen C. Clark, and Jules Bache—were opened, one day each, to the public for a nominal fee.

The firm of Durand-Ruel of Paris and New York, celebrated the 130th anniversary of its founding in March with an important exhibition in its New York Galleries of paintings by Claude Monet. Monet's work was introduced to America by a member of this firm, Paul Durand-Ruel.

Inaugurating the opening of galleries in its new home located at 22 East 60th Street, New York City, the Museum of French Art held in January a comprehensive exhibition of sculpture by Bourdelle. The French Ambassador, M. Claudel, attended the opening on January 11 and made an address. At the same time in the Brummer Galleries, New York, an exhibition of sculpture in bronze and plaster by another distinguished French sculptor of the modern school, Maillol, was held and attended by no less than 31,000 visitors.

Because of financial stringency the National Academy of Design omitted its regular winter exhibition in 1933 but at its 108th Annual Exhibition held in March distributed the following prizes: Thomas B. Clarke Prize to Jerry Farnsworth; first, second, and third Hallgarten Prizes respectively to, William N. Goodell, Catherine Morris Wright, and Junius Allen; Saltus Medal for Merit to Ruth Nicholson, Isaac N. Maynard Prize to Sidney Dickinson; Altman Prizes to W. Granville Smith and Chauncey F. Ryder; Ellin P. Speyer Memorial Prize to Stephen Bransgrove; Adolph and Clara Orig Prize to Louis Betts.

The Pennsylvania Academy of the Fine Arts held its 128th Annual Exhibition as usual in the spring of 1933, at which the following awards were made: Widener Gold Medal for Sculpture to John Gregory; McClees Prize to Edmond Amateis; Jennie Seenan Gold Medal to Georgina Kliegaard; Temple Gold Medal to S. Walter Norris; Carol H. Beck Gold Medal to William Glackens; Walter Lippincott Prize to Wayman Adams; Mary Smith Prize to Catherine Morris Wright.

The Carnegie Institute, Pittsburgh, omitted its annual International Exhibition in 1932, but re-

sumed it again in 1933 with, however, certain changes and restrictions. The number of paintings were reduced and only invited works were shown. The foreign works shown were selected by the Director, Mr. Homer Saint-Gaudens, and his associates in Europe. There were no foreign representatives on the International Jury which was composed exclusively of laymen—the directors of three art museums, Mr. Robert B. Harshe, Director of the Chicago Art Institute, Mr. C. Powell Minnigerode, Director of the Corcoran Gallery of Art, Washington, D. C., Mr. Meyric C. Rogers, Director of the City Art Museum, St. Louis, and Mr. Saint-Gaudens. The prize awards were as follows: First Prize (\$1500) to André Dunoyer de Segonzac (French); Second Prize (\$1000) to John Steuart Curry (U. S. A.); Third Prize (\$500) to Henry Varnum Poor (U. S. A.); and Honorable Mentions to the following: Stanley Spencer (English); Alexander J. Kostellow (U. S. A.); Jose Gutierrez Solana (Spanish); Mariano Andreu (Spanish); the Garden Club of Allegheny County Prize to Max Peiffer Watenphul (Germany).

The American Academy of Arts and Letters opened in November, 1933, to continue to May, 1934, a comprehensive exhibition of paintings and drawings by George de Forest Brush, one of its members.

FOREIGN. At the time of the Economic Conference in London, Edward Bruce, an American artist, held an exhibition of his paintings which was most favorably received.

ART MUSEUMS. Early in January, 1933, the Taft Museum, in Cincinnati, was opened to the public. This museum, located at 316 Pike St., Cincinnati, will perpetually stand as a memorial to the generosity of the donors, Mr. and Mrs. Charles P. Taft, and the cooperative spirit of the leading citizens of Cincinnati, through whose contributions its establishment was made possible. The building, now converted to museum purposes, is one of the oldest residences in the city dating from 1820. It belonged to Mrs. Taft's father and she and Mr. Taft lived therein for many years. In 1927 Mr. and Mrs. Taft offered to present the house and the art collection contained therein to the Cincinnati Institute of Fine Arts, provided the city would raise an additional two and a half million dollars for upkeep. The amount was not only raised but over-subscribed, the subscribers being 3750 in number. Upon the death of Mrs. Taft in 1931, two years after that of her husband, an additional million was provided by will to cover the cost of adapting the house to museum uses and for perpetual maintenance. Under the direction of Walter H. Siple, Director of the Cincinnati Museum Association and the Taft Museum, the house was remodeled and fire-proofed. It still has the appearance of a home but a home in which chief emphasis is put on its art collection. This collection is especially rich in paintings, Limoges enamels of the 13th and 17th centuries, Italian majolicas and Chinese porcelains, and contains a small but choice library of art books given by the two daughters of the donors. Forty pieces of furniture by Duncan Phyfe and other period pieces contribute to

the appearance of a completely furnished home. In the rooms that are not roped off reproductions of old furniture rather than originals are shown.

The new Worcester Art Museum, Worcester, Mass., was opened on January 6. This museum had its inception in 1896 when the first building of the present group was erected. To this nucleus has now been added a building designed by William T. Aldrich, architect, of Boston. It adds twenty galleries grouped around an interior court. In this building a 12th century refectory was installed intact.

The Toledo Museum of Art opened two new wings on January 10. One wing houses a concert hall which seats 1500 people; the other provides enlarged exhibition facilities and more adequate quarters for the museum school. The opening was marked by a concert in the new "Greek" theatre given by the Philadelphia Orchestra under the leadership of Leopold Stokowski. An exhibition of 300 paintings from the Museum's permanent collections, ranging from primitives and old masters to the work of contemporary painters occupied the 36 galleries of the enlarged building. There were also on exhibition at that time the Libbey Collection of ancient glass, reinstalled in a magnificent court; the permanent collections of Oriental and Egyptian art; the George W. Stevens Collection of books and manuscripts, and a great number of prints.

Seattle, Washington, opened its new Art Museum on July 1. This museum is essentially modern in design with solid exterior walls without window openings. It was the gift of Mrs. Eugene Fuller and her son, Dr. Richard E. Fuller, who at the present time is acting as director.

The Springfield Museum, Springfield, Mass., was formally opened on October 7th with appropriate ceremonies. This building is of white limestone, modern in style, and contains not only fourteen galleries but an auditorium and class rooms. James Philip Gray and his wife, Julia Emma Gray, were the donors. At the time of the opening an exhibition of Eighteenth Century Paintings and Contemporary American Paintings was set forth. This exhibition was assembled by Josiah P. Marvel, Director.

The William Rockhill Nelson Gallery of Art at Kansas City, Mo., a building costing \$2,750,000, was formally opened on December 10. This building designed by Wight and Wight, which is classical in design, is unique in having no skylights. All galleries have overhead, artificial light provided by a system especially designed for the purpose. The sculptural adornments of the exterior are by Charles Keck and depict the exploration and settlement of the middle west. The bronze doors at the south entrance were designed by Charles Keck and the architects, Wight and Wight. The landscape setting was the work of the St. Louis firm of Hare and Hare. The first and second floors contain the galleries for both permanent and loan exhibits, period rooms, and an oak hall, taken from Mr. Nelson's house. On the ground floor are an auditorium, administrative and receiving offices, library, educational department, and an American Indian room. The Nelson Gallery was erected from funds bequeathed by Mr. and Mrs. William Rockhill Nelson and their daughter and son-in-law, Mr. and Mrs. Irwin Kirkwood. To these bequests was added another, made by Mrs. Mary F. Atkins, for whom the East Wing of the building is named. The Nelson bequest also provided for the collections. These col-

lections were gathered under the trusteeship of J. C. Nichols, H. V. Jones, and A. M. Hyde, a staff composed of Paul Gardner, Director, Charles O. Cornelius, American Adviser. Rarely has a Museum come into existence in just this way and seldom has a new Museum opened with such a rich permanent collection.

In the late autumn the corner-stone of an Art Museum at the University of Virginia, Charlottesville, Virginia, was laid with appropriate ceremonies.

The Brooklyn Museum opened on May 19th a new Egyptian Hall with an exceptionally fine installation by Jean Capart, Director of the Royal Museum of Art and History, Brussels. At the opening M. Capart made the principal address.

Several valuable paintings, including eight from the Friedsam Collection, by such famous artists as Van der Weyden, Fouquet, Clouet, Luini, Fra Angelico, Van Dyck, Lawrence, Romney, Cranach, and Rubens, were stolen from the Brooklyn Museum on the night of April 30th. A reward of \$2000 was offered by the Museum for information leading to their recovery, but without result.

During the past year the Chicago Art Institute installed in the Hutchinson Wing a Bavarian Room.

The Boston Museum of Fine Arts this year discarded all of its casts of sculpture, because of the growth of its collection of originals. The casts were dispersed by gift to teachers and institutions in Boston. Smith College also disposed of all the casts in its permanent collection.

During the early months of 1933 Whistler's portrait of his Mother, on loan from the Louvre in Paris, was shown in museums at San Francisco, Los Angeles, St. Louis, Columbus; and from June 1st to November 1st it was included in the Century of Progress Exhibition at the Chicago Art Institute. In November it was at the Cleveland Museum of Art and in December it was shown in the new Museum at Kansas City. Twenty-nine cities requested the privilege of showing the painting, only twelve of which were able to get on the schedule which presumably will end with its return to Paris in June, 1934. However, the Museum of Modern Art petitioned the Louvre for an extension of time. Extraordinary precautions have been taken to guard this painting not only in transit from city to city but while on display. It has been shown only in completely fire-proof buildings, and has been protected not only by a guard on constant duty and an iron rail but by a concealed mechanism so delicate that if the painting were moved in the slightest degree a loud alarm would sound. For further protection a detailed photograph of the painting is taken by each museum on the day of its arrival and departure. The genuineness of the photograph is vouched for by the affidavit of museum officials. The final detail of authenticity is assured by photographing with the painting a local newspaper published the day it arrives and the day it leaves the city. When it is recalled that this painting might have been purchased in this country for the modest sum of \$800, at the time it went to the Louvre, its present valuation and popularity are the more remarkable.

The Museums of this country have quite generally suffered from financial conditions. Not only have their incomes been seriously cut down but there has been a diminution in gifts of money.

On April 11th for economy's sake the Newark Museum closed two of its departments, dismissed

eighteen members of its staff and reduced the salaries of the remaining staff members 25 per cent, the city having reduced its annual appropriation to the Museum from \$100,000 to \$65,000. The Detroit Art Institute has during the year been on a greatly reduced budget and its director, Dr. Valentiner, for this reason has been on indefinite leave.

FOREIGN. What has been called an "outstanding example of International reciprocity in art" was the exchange of objects between the Spanish Republic and the Fogg Museum of Harvard University which took place in 1933. The Fogg Museum's donation was the famous Sahagun tomb, a much prized historical treasure, the return of which was coveted by Spain. In acknowledgment of this generous gift the Spanish Republic presented to the Museum a group of art objects, most important among which were four columns which supported the altar of St. James in the pilgrim shrine of Santiago de Compostela and dated back to the early part of the 12th Century.

In June, Bernard Berenson, the well-known art critic and connoisseur, announced his intention to give his home, the "Villa i Tatti," near Florence, Italy, and his art collection therein to Harvard University, his Alma Mater, to be used as a residence for American art students.

The Spanish Republic made public acknowledgment of a gift from the artist's widow, of fourteen paintings of eminent Spaniards by Maurice Fromkes to form the nucleus of a National Portrait Gallery in Madrid. Fromkes was an American but had spent much time in Spain and was best known for his paintings of Spaniards.

ACQUISITIONS. Despite financial stringency the list of museum acquisitions during the year 1933 contains some notable items, due undoubtedly to the fact that purchase funds remained intact.

Not long ago the Metropolitan Museum (N. Y.) acquired a terra cotta statuette of Diadoumenos, an ancient copy or adaptation of the "Youth tying a fillet around his head," by Polykleitos, but in 1933 the Metropolitan Museum acquired a life-sized marble statue, a Roman copy of the same work, and placed it on view in its Hall of Recent Acquisitions. The entire torso had to be restored in plaster but the good preservation of the remaining parts compensated for this loss. The Metropolitan Museum also acquired two panels of a diptych (picturing the Crucifixion and the Last Judgment), ascribed to Hubert Van Eyck, a work which was included at one time in the permanent collection of the Imperial Museum of the Hermitage, Russia. It was then catalogued as by John Van Eyck, but the attribution was later changed to Petrus Cristus. However, regardless of attribution it is a marvelous work. This same Museum acquired through purchase paintings by Raphael and Mantegna; a 14th century tapestry and some fine armor of the 16th century. Through the gift of John D. Rockefeller, Jr., the Museum acquired a magnificent collection of Assyrian sculpture from the Palace of King Ashur-Wasir-Apal II; and an important Burgundian sculpture of the 15th century was purchased by the Museum. In December the Metropolitan Museum of Art received two large and important gifts of textiles—a collection of lace brought together by the late Mabel Metcalf Fahnestock and presented by her daughters, Mrs. Ruth Fahnestock Schermerhorn and Miss Faith Fahnestock—one of the finest private collections ever assembled in this country—and a splendid group of European woven fabrics and embroideries, the gift of Mrs. Valentine A. Blaque of Paris in memory of her husband.

The Museum of Fine Arts, Boston was enriched by a gift of 250 pieces of English silver of the 16th, 17th, and 18th centuries, anonymously given as a memorial. This Museum also acquired Sargent's portrait of Edith, Lady Playfair, and a painting by Cezanne "L'Estaque."

The St. Louis City Museum bought a painting by Tiepolo and a fine Attic stele. Paintings by Eugene Speicher, Maurice Sterne, and Alexander Brook, contemporary American artists, were also acquired.

The Cleveland Museum of Art acquired a pastel by Whistler, a stone head of Buddha of the 12th century, and a 14th century reliquary.

The Toledo Museum of Art acquired a bronze bust of the Duchess of Hamilton by Jacob Epstein and a Gothic stone figure of St. Joseph of d'Armathie.

The Minneapolis Institute of Arts purchased a marble head of Aphrodite of the 4th century B.C., and also a bronze Renaissance bust of an aged patrician, as well as a German Gothic statue of "Saint Eloi Shoeing the Leg of a Horse." This museum also received during the year a notable gift of American silver.

The Fogg Museum bought an important Spanish painting of the late 15th century and received as an anonymous gift a collection of nearly 4000 Japanese prints.

The Museum of the Rhode Island School of Design acquired two paintings by Daumier.

The Cincinnati Museum bought "Family Group" painted by Cornelis de Vos.

The Dallas Museum, Dallas, Tex., acquired a portrait by Van Dyck.

The Seattle Museum acquired three works in sculpture by Hunt Diederich and also a work by Allen Clark.

The Albright Gallery, Buffalo, purchased Monticelli's Portrait of Madame Rosenthal.

The Addison Gallery of Art, Phillips-Andover Academy, purchased a head of the Japanese poet, Noguchi, by Alfeo Faggi.

Smith College Museum of Art acquired a wooden statue in polychrome of a "Man with Falcon," of the 14th or 15th centuries which came from the French Pyrenees. A bronze portrait head of Paul Robeson by Jacob Epstein was also acquired.

The Whitney Museum early in January announced the purchase of 28 paintings from its First Biennial Exhibition of Contemporary American Paintings held the previous month. This purchase made from a fund of \$20,000 contributed by Mrs. Harry Payne Whitney took the place of the usual prize awards. The paintings were added to the Museum's permanent collection.

A portrait bust of "Pop" Hart by Reuben Nakian was given to the Museum of Modern Art by Mrs. John D. Rockefeller, Jr.

NECROLOGY. Among leaders in this particular field were the following deaths during 1933: William Sloane Coffin, President, Metropolitan Museum of Art; Joseph Breck, Director of the Cloisters, Metropolitan Museum; Eli Kirk Price, President of the Pennsylvania Museum; Francis H. Dewey, President, Worcester Museum; Benjamin Ives Gilman for many years Secretary of the Museum of Fine Arts, Boston; Philip H. Henry, founder and director of the Phillips Art Museum of Asheville, N. C.

ART SALES. In June, 1933, the American Art Association-Anderson Galleries, Inc. (N. Y.) announced a total of \$3,180,117.50 realized by 66 sales conducted during the season of 1932-33, beginning the last of September of the former year and concluding May 25th of the latter. Of this amount, paintings brought \$848,757.50; prints \$48,207.50; furniture, tapestry, rugs, silver, and other art objects, \$1,910,762. The highest total reached in any one collection was \$347,940, brought by that of the late Alfred H. Mulliken of Chicago and New Canaan, whose collection embraced distinguished 17th and 18 century British and French portraits, notable antique English and other furniture, rare clocks, silver, porcelains, etc. The paintings in this collection realized \$286,100. From it the Springfield Museum of Fine Arts secured several important works. Other museums that did the same were the New York Metropolitan Museum, the Brooklyn Museum, the Reading Public Museum and Art Gallery, the W. R. Nelson Gallery of Art in Kansas City, etc. Despite hard times, the dispersal of this and many other collections, during the season was marked by attendance which taxed the capacity of the large assembly hall.

The Burton Mansfield Collection consisting mainly of examples of the American School also sold well. In this collection a water color by Winslow Homer, "Watching the Tempest," brought \$3100—a record price—and an oil painting, "Fisher Girl" by the same artist, sold for \$11,000.

At this sale paintings by Childe Hassam and J. Alden Weir brought the highest prices realized for works by these painters within the last four years. One thousand eight hundred dollars was paid for a pastel, "A Venetian Scene," by Whistler. The highest price paid for any painting during the season was \$35,000, fetched by Hoppner's half-length portrait of "Louisa, Countess of Mansfield," the property of Sir Charles and Lady Gunning of London, which sold in New York in April. Rembrandt's "Woman Plucking a Fowl" from the Kleinberger Collection sold for \$26,000, while Lawrence's portrait of "Mrs. Raikes and Daughter" sold for \$17,100. All three of these paintings went to private collectors. The 31 paintings in the Gunning Collection brought in the aggregate over \$100,000; the Kleinberger Collection of primitives and old masters, \$126,635, and the Mulliken Collection of paintings, \$286,100.

Among the prints sold were two examples of Whistler's "Nocturne; Palaces," both in the seventh state, one of which brought \$1325 and the other \$1300.

Less American furniture was sold during this season than the previous one, fine 18th Century English and French furniture predominating. Two sales of American furniture, one in January and the other in March, yielded \$91,719. In one of these sales, \$1300 was paid for a church bell cast by the Reverses of Boston.

FOREIGN. The prices of pictures went up in London sales rooms during the year 1933. At Sotheby's in June the sum of £9200 was realized for six sketches by Rubens from the Barrymore Collection, Marbury Hall. At the same sale Mantegna's painting of "The Virgin Nursing her Child" went for £1950, and the National Art Collection Fund acquired "Job in his Misery" by Jan Lievin for £400. Three thousand one hundred guineas was paid at a later sale for a small Hobema. In June the Director of the National Gallery of Ireland secured a painting of St. Justa by Zurburan, paying 720 guineas for it. In July, portraits of the late Lords Baltimore, six in number, came up for sale at Sotheby's. Through the interest and enterprise of an American attending the Economic Conference and the cooperation of the former owner and new purchasers, five of these paintings were acquired for the State of Maryland. They have been given permanent placement in the State capitol at Annapolis.

At Christie's on June 15, when the Oppenheim Collection was sold, objects of art, furniture, metal work, etc., brought higher prices than for many years.

A portrait of Joseph Conrad painted in 1924 by Walter Tittle, American artist, was purchased by the British Nation for inclusion in its National Portrait Gallery. The King of England in May ceremoniously opened the new Duveen wing to this Gallery.

The King of Italy bought a small equestrian statue by Sidney B. Waugh, Fellow in Sculpture, American Academy in Rome, which was shown in an exhibition there.

High prices were also maintained in French and German sales rooms.

ASTRONOMY. Although eclipses, occultations, configurations of the planets, the position of the moon, the returns of the known periodic comets, and other phenomena, can be predicted years in advance, nevertheless most spectacular events of astronomy occur unheralded—remarkable meteoric showers, brilliant comets previously unknown, novæ visible in full daylight, and so on. The most spectacular event of 1933 was the appearance, early in August, of a bright spot on Saturn, which lasted until about September 13. This spot was discovered independently by an amateur observer in England, the Berlin Observatory, and the Naval Observatory at Washington. Only twice before has a spot, or any other irregular marking, been observed; in 1876, Asaph Hall observed the first spot, and in 1903 Barnard at the Yerkes Observatory observed the second.

The spot was, when first observed, about one-fourth of Saturn's diameter long, and one-eighth of the diameter wide, or about 9000 by 4500 miles. Later observations showed it to be the brightest of a row of spots stretching some 40° in longitude, or about 50,000 miles. The appearance of a similar spot on Jupiter would be no news at all, for Jupiter's surface is crowded with details and changing constantly; but Saturn habitually presents an almost featureless surface. Before any spots had been observed on Saturn there was no doubt that it rotated rapidly since the polar flattening is greater than for any other planet. All three of the white spots have been used to determine Saturn's period of rotation, although the first determination was made by Sir Wm. Herschel in 1794 without the aid of any definite spot but from some peculiarity of the surface.

Barnard's spot was in planetary latitude +36° and from it Barnard established the fact that the equatorial rotation of Saturn is much faster than at mid-latitudes. This, as is known, is also the case with Jupiter, but the Saturnian equatorial excess appears to be much greater (almost five times) than the Jovian. Thus it is believed by many astronomers that the visible surfaces of both planets are formed of clouds driven by powerful and persistent winds. This is not strange, for the earth would appear to an outside observer as thickly dotted with brilliant white spots, and having cloudy regions in a belt near the equator, with clearer zones on each side, and irregular masses nearer the poles corresponding to the storm areas of the temperate regions; as the earth's storm areas usually move eastward several hundred miles a day, an outside observer would deduce from them a rotation period shorter (by about twenty minutes) than 24 hours. In the trade wind zones within the tropics the winds are prevailing from the east, and clouds would give a longer period than 24 hours. The differences in rotation period of these terrestrial spots would thus range over nearly an hour, or even more if an outside observer happened to catch cirrus clouds driven by the rapid westerly winds at high altitudes. These differences are far less than for the great planets; the winds in the stratospheres of the latter must blow at speeds far exceeding the earth's worst hurricanes. If spots like the last two (Barnard's and the 1933 spot) should appear simultaneously on Saturn, the difference in their rotations would cause the equatorial spot

to gain a whole revolution on the other in about 26 of Saturn's rotations on its axis. It is 232,000 miles around Saturn's equator, hence if the northern spot were fixed to the body of the planet there would be a west wind on the equator blowing 800 miles an hour. It is not so far around the planet in a higher latitude so a 650-mile east wind in the temperate zone would suffice here. Or there might be a 400-mile west wind at the equator and a 300-mile east wind in the North. Why such tremendous gales should blow upon the great planets is not yet understood.

Perhaps the next most spectacular event was the display of meteors which took place on October 9. These were visible throughout Europe, but were not seen in North America. The display was believed to be the most brilliant since the Leonid shower of 1866. Gerasimovic at the Poulkovo Observatory reported a rate of more than one hundred meteors per minute and Witkowski at Poznan estimated a maximum rate of ten meteors per second.

The radiant point was in the constellation Draco. These meteors were moving in the same orbit as the Giacobini comet. This comet has a perihelion distance equal to the earth's distance from the sun, and its orbit is inclined 30° to the ecliptic. The comet was observed this year as a very faint object, and came to perihelion on July 15, reaching the point of closest approach to the earth on July 21. At the time of the meteor shower it had passed far beyond, and was nearly 150 million miles away. The swarm of tiny particles which followed behind it, and gave rise to the meteor shower, trailed a long distance. It seems probable that the October display arose from the earth's encounter with a denser cluster of meteoric particles in this long trail, for the main part of it lasted only about two hours, during which time the motion of the meteors relative to the earth was only about 75,000 miles. At the next return of the comet (1940) the earth will be far away on the opposite side of the sun, but in 1946 there should be a really close approach of the two bodies, and a remarkable display of meteors may be visible.

A number of crater-like formations discovered in recent years in different parts of the world where there is no indication of volcanic action have been carefully studied recently. There is considerable evidence in favor of the theory of meteoric origin not only of the well-known Meteor Crater in Arizona, but also of the group of craters found near Henburg, Australia, in 1931, and of the craters found at Wabar, in the Arabian desert, in 1932. Others that have been studied are the craters near Vanovara in North Central Siberia; near Odessa, Texas; on the Island of Oesel, in Esthonia; and (the most extensive of all) those discovered on the South Atlantic Coast, between Norfolk and Savannah, from aerial maps of this region made in 1930: these photographic maps revealed numerous elliptically shaped scars over this territory; covering an area of 40,000 square miles; these scars were extensively investigated by Melton and Schriever, and they announced their conclusion as to meteoric origin late in 1932. The average length of the scars is 2210 feet and average width 1430 feet with maxima of 8090 feet and 4410 feet respectively; the major axes of the ellipses are practically parallel.

Opik has completed an investigation on the perturbations of a comet (or meteor), while in the aphelic part of a very elongated orbit, by passing stars. On reasonable assumptions as to

the mass and relative velocity of the disturbing star, as well as the frequency of these approaches, the perturbations are shown to increase the perihelion distance systematically when the aphelion distance is over 2000 astronomical units. Meteors or comets of aphelion distance greater than 10,000 astronomical units are not likely to come within observable distance. To make the discovery of an ordinary sized comet probable it is necessary that it have a perihelion distance less than two astronomical units.

Near aphelion a comet moves very slowly: thus, one with a period of one million years will have a maximum distance of 20,000 astronomical units, and requires almost 100,000 years to travel the last hundred units of this distance. The stars move much faster. If, when the comet was at aphelion, a star came within 10,000 units, the comet would then be attracted by the star four times as strongly as by the sun; but with the average motion that a star would have, the star could not remain at this close distance for more than about 3000 years. Its attraction would therefore act for only a short time, while the sun attracts the comet incessantly. Hence, even at great distances the sun's influence prevails, and the extent of its effective domain is much greater than has previously been supposed. The net effect of the star's attraction on a comet is to give the latter a pull toward the nearest point on the star's track. The closer the star comes, the greater is its attraction, but the shorter is the time during which it is near, so that the effect does not increase to nearly as much as that of the steady pull of a fixed body.

A disturbance great enough to pull the comet away from the sun into a parabolic or hyperbolic orbit would be produced only if the star came really near it. For a comet 20,000 units from the sun the approach would have to be within 200 units; for one million units away, within 1400 units. The stars are so far apart that such approaches must be exceedingly rare. Opik calculates that, if the sun had a family of comets with orbits so elongated that their maximum distance was one million astronomical units, it would take 3,000,000,000 years for one-half of the number to be lost by encounters with passing stars. Only 7 per cent of comets within an aphelion distance one-tenth as great would be lost at the same time. With the larger distance a comet's period would be about 350 million years, with the smaller about 11 million, so that the former group is likely to make several returns to the sun, and the latter a great many, before they vanish into space.

The chance that a comet of such long period will continue to return near enough to the sun to be observed from the earth is much less probable. Opik concludes that a comet with a period of a million years would have at best an even chance of continuing, during the probable past history of the solar system, to return within the region where comets shine and grow tails. Comets with smaller periods would be less affected. Opik's estimates of observed inclinations suggest that observable comets do not go beyond 2000 astronomical units. His theory affords an estimate of the extreme limit of the solar system at 10^6 astronomical units.

EXTRAGALACTIC SYSTEMS. From an investigation of 45,000 extragalactic nebulae identified on 1300 plates, Hubble has outlined the zone of avoidance and concluded that within the errors of observation the distribution in the twogalactic hemispheres is the same. There is no appreciable

systematic variation in longitude, but the increase in numbers with latitude is well defined, following a cosecant law between 15° and 90° . Except for occasional clusters, the distribution over the sky is random, and the increase in numbers with the exposure time of the plates is consistent with a uniform distribution in depth.

A faint cluster in *Corona Borealis*, discovered by Hubble, shows about 600 nebulae, with a most frequent photographic magnitude of about 19.5, within a circle $30'$ in diameter. A red shift corresponding to a velocity of $+21,000$ km/sec. observed by Humason for one of the nebulae in this cluster is in excellent agreement with the value predicted by Hubble from its distance. This is the largest recessional velocity thus far observed.

MISCELLANEOUS. C. T. Elvey has measured the sky background in the region containing the Gegenschein with a photoelectric photometer attached to the 40-inch telescope at the Yerkes Observatory. These measurements furnish data sufficient to separate the illumination which is due to the Gegenschein from that which arises from the light scattered in the atmosphere. He obtained an integrated brightness of the Gegenschein equivalent to a star of photographic magnitude $+0.2$.

On the assumption that our galaxy was formed by the encounter of two spherical systems of stars, in each of which the physical characteristics of the stars permanently near the centre differed somewhat from those of stars near the boundary, Strömberg has carried on a theoretical investigation of the dynamics of the galaxy which has led to a new formulation of the energy integral in the problem of three bodies.

On October 6, the tercentenary of the Astronomical Observatory at Leiden, Holland, was celebrated. This is the oldest university observatory in Europe, having been founded by Golius, a pupil of Snellius.

On November 1, the Fels Planetarium was opened to the public in Philadelphia. This is the second planetarium to be opened in America, and the twentieth in the world.

PHENOMENA. Six comets appeared during 1933, including the returns of Pons-Winnecke, Wolf, and Giacobini 1900 III. A new outburst of Nova Ophiuchi No. 3 (R S Ophiuchi) took place in August; the magnitude reached 4.3 on August 12. The brightest magnitude previously observed was 7.7, in 1898; during the past 20 years, the magnitude has fluctuated from 11 to 12. After the outburst, the spectrum showed some of the coronal lines.

ATHENS. See ARCHEOLOGY.

ATHLETICS, TRACK AND FIELD. Two slim college youths, one from Dunedin, New Zealand, representing Oxford University, the other from Princeton University, furnished the major thrill and achievement of the 1933 track and field season. On a July afternoon, under perfect conditions and on a magnificently groomed track at

Princeton, in the Princeton-Cornell vs. Oxford-Cambridge track meet, this pair eclipsed the mile record, most important of track fixtures. The winner was Jack E. Lovelock of Oxford, the loser William R. Bonthron of Princeton. Lovelock raced shoulder to shoulder with the black haired Princetonian all the way, burst ahead at the last turn and broke the tape in 4:07.6, with Bonthron trailing by six yards and crossing the finish line in 4:08.7. Against this time stood the world's previous best of 4:09.2, hung up by Jules Ladoumegue, of France, in 1931. Bonthron had capped a great season by taking the double at the Intercollegiates—the mile and the half-mile. Lovelock had been in the Olympic mile final, had broken the world's three-quarter as well as the British mile marks. On top of his great effort against Lovelock, Bonthron came back an hour later to win the half mile in 1:53 against the invading squad.

All in all, the mile at Princeton was the major achievement of the year, but during the year no less than twelve track and field records fell, with Americans responsible for five of them. Luigi Beccali, Italian, who had taken the 1500 meter run (Olympic mile) at Los Angeles in 1932, shattered two existing marks in 1933. He ran the 1500 meters in 3:49, beating Lovelock on the way, at Turin. He turned in 1000 yards in 2:10.1, as against the listed standard of 2:11.2 Johnny Morriss, of Lafayette, La., lowered the 110-meter hurdles mark, doing 0:14.3 in the national A.A.U. meet in Chicago in June. V. Iso-Hollo, Finnish runner, lowered the four-mile mark to 19:01. Walter Marty of Fresno, California eclipsed the best running high jump mark when he cleared 6 feet, $8\frac{5}{8}$ inches. Ben Eastman, blonde Stanford University runner, remembered for his memorable quarter-mile duels with Bill Carr in 1932, set a new 600-yard mark of 1:09.2. Matti Jarvinen of Finland bettered the javelin record with a toss of 224 feet, 9 inches, and H. Sievert of Germany piled up 8467 points in the decathlon to better the record by five points. Glenn Cunningham, barrel chested runner from the University of Kansas, added his name to the record book with a new American record for 1500 meters of 3:52.3. Cunningham was the hero of the indoor season because of his trio of mile triumphs over Gene Venzke, and because of one 4:12 mile indoors. Cunningham, a member of the United States team that toured Europe in the summer, was beaten only twice in the year, once by Venzke in the national indoor 1500 meter run, and again in the N.C.A.A. half mile in the summer when Charles Hornbostel of Indiana University nipped him at the tape. In those same N.C.A.A. games Cunningham turned in a mile in 4:09.8. Cunningham won the national A.A.U. outdoor 1500 meter event as well as the 800-meter run.

Ralph Metcalfe, from Marquette University, won National A.A.U. championships at 60, 100 and 200 meters and N.C.A.A. titles at 100 and 220 yards. He was hitting world's record almost every time and went through the year with only one defeat. Keith Brown, the Yale University pole vaulter, tied for four major championships: the Intercollegiate indoor and outdoor, the National A.A.U. indoor and outdoor. He cleared 14 feet or better five times.

Miss Annette Rogers of the Illinois W.A.C. was the outstanding performer in women's track. She captured the 100-meters dash outdoors, the 200 meters and the running high jump indoors.

In November the A.A.U. passed a resolution pledging a boycott of the 1936 Olympic games at Berlin unless the Nazi stand of anti-Semitic discrimination in sports was discontinued. A few days later, on assurance from Dr. Theodore Lewald of the German Olympic Committee and Brig.-Gen. Charles H. Sherrill, American member of the International Olympic Committee, that all restrictions would be removed, the American Olympic Association passed a more conciliatory resolution with the boycott threat one of inference rather than of direct words.

AUSTRALIA, COMMONWEALTH OF. A confederation of six States, established Jan. 1, 1901, as a self-governing dominion of the British Empire. Capital, Canberra.

AREA AND POPULATION. The area of the six States and two Territories and the census populations of Apr. 4, 1921 and June 30, 1933, are shown in the accompanying table.

AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in square miles	Population Apr. 4, 1921	Population June 30, 1933
New South Wales	309,432	2,100,371	2,601,104
Victoria	87,884	1,531,280	1,820,360
Queensland	670,500	755,972	947,789
South Australia	380,070	495,160	580,987
Western Australia	975,920	332,732	438,948
Tasmania	26,215	213,780	227,605
Northern Territory	523,620	3,867	4,860
Federal Capital Territory	940	2,572	8,947
Total	2,974,581	5,435,734	6,630,600

During 1932, births numbered 110,933 (118,509 in 1931); deaths, 56,755 (56,560); marriages, 43,634 (38,882). Births in 1932 exceeded deaths by 54,178 (61,949 in 1931), while emigration exceeded immigration by 4843 (12,061 in 1931), leaving a total estimated increase of 49,335 (49,888 in 1931). The rate of increase for both 1931 and 1932 was less than half the annual rate of increase for the previous decade. The census populations of the chief cities (all of them State capitals) on June 30, 1933, with figures for Jan. 1, 1932 in parentheses, were: Sydney, New South Wales, 1,235,367 (1,256,230); Melbourne, Victoria, 992,048 (1,030,750); Brisbane, Queensland, 299,782 (317,150); Adelaide, South Australia, 312,629 (324,337); Perth, Western Australia, 207,464 (209,729); Hobart, Tasmania, 60,408 (58,270). The population of Canberra, the Federal capital, on June 30, 1933, was 7325. These seven cities contained approximately half the total population of the Commonwealth.

EDUCATION. Elementary education is free and compulsory. In 1930, there were 10,257 State-aided schools, with an average attendance of 801,729, and 1803 private schools, with an average attendance of 193,691. The six State universities, located in the capitals of the respective States, had 2693 matriculated and 1209 non-matriculated students in attendance in 1930. For educational statistics of the several States, consult the article on each State.

PRODUCTION. Australia is primarily dependent upon its agricultural and livestock industries, although manufacturing is extensively developed.

The estimated value of production by industries for the fiscal years ended June 30 are shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED JUNE 30

[In thousands of pounds sterling]

Item	1930	1931	1932
Agricultural	£ 77,109	£ 70,500	£ 74,489
Pastoral	84,563	69,499	61,540
Dairy, poultry, bee-farming	49,398	43,067	41,478
Forestry and fisheries	11,371	8,319	7,653
Mining	17,912	15,856	13,852
Manufacturing*	149,184	112,966	106,456
Total	389,537	319,701	304,968

* Value added in process of manufacture.

Wheat and wool are the primary products of agriculture and stock raising respectively. Of the 21,166,900 acres under crops during the 1931-32 season, 14,741,313 acres were devoted to wheat. This compared with a wheat acreage of 18,164,920 in 1930-31 out of a total crop acreage of 25,163,816; the crop acreage was less than 2 per cent of the total land area. Wheat production in 1932-33 was estimated at 212,398,359 bushels (190,612,188 bushels in 1931-32). Production of the other leading crops in 1931-32 was: Oats, 15,194,080 bushels (16,658,058 in 1930-31); corn, 7,062,383 bushels (8,025,619 in 1930-31); hay, 3,167,459 tons (4,149,061); sugar cane, 4,213,453 tons (3,688,869). Wool production for the season ended June 30, 1932, amounted to 1,006,630,847 pounds (913,141,253 pounds in 1930-31). Live-stock in the country in 1931 included 110,618,893 sheep, 12,260,955 cattle, 1,776,421 horses, and 1,167,845 swine. Dairy produce during 1931-32 included 390,654,070 pounds of butter, 31,422,973 pounds of cheese, and 71,121,740 pounds of bacon and ham.

Minerals produced during 1932 consisted of 713,882 fine ounces of gold, 8,544,148 tons of black coal, 14,406 tons of copper, 190,132 tons of pig iron, 187,515 tons of lead, 8,993,578 ounces of silver, 2059 tons of tin, and 84,742 tons of zinc. The value of all minerals extracted during the calendar year 1932 was £15,613,299 (£13,352,316 in 1931). The value of manufacturing production, including the cost of materials used, showed a sharp decline from £420,445,288 in 1928-29 to £281,645,785 in 1931-32. During the same period the value added in process of production fell from £167,623,316 in 1928-29 to £110,981,830 in 1931-32. In the latter year there were 21,657 factories, with 336,658 workers, who received wages of £55,931,818. In order of the value of output in 1931-32, the principal manufacturing lines were: Food, drink, and tobacco, £28,697,012; industrial metals, machines, implements and conveyances, £22,804,135; clothing, £11,105,046; heat, light, and power, £9,699,248; and paper, stationery, printing, book binding, etc., £9,620,946.

COMMERCE. The upturn in Australian foreign trade in the year ended June 30, 1933, after the continuous declines of the preceding four years, is shown in the accompanying table compiled by the Commonwealth Statistician.

In Australian currency values, exports totaled £104,354,638 in 1930-31, £107,967,143 in 1931-32, and £121,277,185 in 1932-33. In previous years British and Australian currency values were the same. The value in Australian currency

AUSTRALIAN FOREIGN TRADE, 1928-29 TO 1932-33
(British currency values)

	Imports	Exports *	Surplus of imports (-) or exports (+)
1928-29	£143,647,861	£141,632,589	£- 2,015,292
1929-30	131,081,820	125,127,148	- 5,954,172
1930-31	60,959,638	88,904,142	+ 27,944,509
1931-32	44,712,868	85,002,631	+ 40,289,763
1932-33	57,985,442	96,861,556	+ 38,876,114

* Including re-exports.

of the leading export items in 1932-33 (1932-32 in parentheses) was: Greasy wool, £32,103,045 (£28,983,787); scoured wool, £4,299,816 (£3,118,459); butter, £9,264,665 (£9,812,827); flour, £4,147,003 (£3,833,237); mutton and lamb, £2,697,224 (£2,994,062); beef, £1,854,582 (£2,087,829). The six leading import lines in 1932-33, in order of value, were: Apparel, textiles and manufactured fibres; metals, metal manufactures, and machinery; paper and stationery; oils, fats, and waxes; drugs, chemicals, and fertilizers; and vegetable foodstuffs and non-alcoholic beverages. During 1932, United States statistics showed exports to Australia of \$26,817,690 (\$27,167,312 in 1931) and imports from Australia of \$4,643,403 (\$12,504,130).

For the year ended June 30, 1933, imports from the United Kingdom were valued (in British currency (at £23,930,554; from the United States, £8,007,809; Japan, £3,564,553; Netherland India, £2,907,204; Canada, £2,244,369. Exports from Australia (in Australian currency) in the same period were: United Kingdom, £65,975,132; Japan, £11,468,459; Germany, £5,084,802; United States, £3,538,650; New Zealand, £2,770,237; and Canada, £1,209,237.

FINANCES. For the fiscal year ended June 30, 1933, revenues totaled £73,512,809 (£71,532,298 in 1931-32) and expenditures were £69,967,000 (£70,218,207 in 1931-32). The surplus was £3,547,000 in 1932-33 and £1,314,091 in 1931-32. The budget estimates for 1932-33 were: Revenue, £65,986,000; expenditure, £67,287,000. For 1933-34, revenue was estimated at £68,580,000 and expenditure at £69,756,000, leaving a deficit of £1,176,000. For details of the 1933-34 budget, see under *History*. Revenue and expenditure of the Commonwealth and of the six States in 1932-33 are shown in the accompanying table.

REVENUE AND EXPENDITURE OF AUSTRALIAN COMMONWEALTH AND STATES, 1932-33
(In thousands of pounds sterling)

State	Revenue	Expenditure	Surplus (+) or deficit (-)
New South Wales	50,721	54,992	- 4,271
Victoria	24,283	25,139	- 856
Queensland	13,397	14,951	- 1,554
South Australia	10,161	11,170	- 1,009
Western Australia	8,332	9,196	- 864
Tasmania	2,522	2,577	- 55
Total, six States	109,416	118,025	- 8,609
Commonwealth	73,512	69,967	+ 3,545
Grand total *	172,430	177,494	- 5,064

* Duplications eliminated.

According to provisional figures, the public debt of the Commonwealth on June 30, 1933, stood at £396,806,503 and that of the States at £807,851,620, or a total of £1,204,658,123. The Commonwealth debt on June 30, 1932, was £398,

884,730, the State debt was £788,943,138, and the total Commonwealth and State debt was £1,187,827,868, or more than £181 per capita. Not taking exchange difficulties into account, the nominal interest payable on the total debt in 1932-33 was £50,437,385 (£33,289,319 on the States' and £17,148,066 on the Commonwealth debt). In addition, there was a short-term debt on June 30, 1933, of £83,000,000, of which £69,280,000 represented State and £13,720,000 Federal obligations.

COMMUNICATIONS. On June 30, 1932, there were 26,959 miles of government railways and 840 miles of private railways open for traffic. Of the government lines, 2145 miles were owned by the Commonwealth and 24,814 miles by the six States. For the year 1931-32, all government lines reported gross earnings of £37,580,000 and operating expenses of £28,142,000. All the systems showed an improvement in their net financial position in 1931-32, as compared with the previous year. The Federal system's deficit was reduced to £78,000 from £150,000 in 1930-31. There are some 330,000 miles of highways, of which about 6500 miles are macadam. Statistics of subsidized civil aviation for the fiscal years ended June 30, 1933 and 1931 (figures for 1931 in parentheses), were: Number of flights, 3704 (3655); miles flown, 553,479 (556,966); pounds of freight carried, 445,759 (443,059); pounds of mail carried, 30,722 (27,320); passengers carried, 8644 (7422). The net shipping tonnage entering Australian ports during 1931-32 totaled 5,686,898, of which 3,946,918 tons represented vessels with cargo; net tonnage cleared, 5,708,886 (5,256,181 tons with cargo).

GOVERNMENT. Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each State), elected for six years, and a House of Representatives of 75 members apportioned among the States on a population basis. The composition of the House in 1933 was: United Australia party, 37; United Country party, 16; Labor (Federal group), 14; Labor (Lang group, 5); Independents, 3. Governor-General, Sir Isaac Alfred Isaacs. The Ministry, as reorganized Oct. 13, 1932, was composed as follows: Prime Minister and Treasurer, Joseph A. Lyons; Attorney-General, Minister for External Affairs and Minister for Industry, J. G. Latham; Minister without Portfolio, Stanley M. Bruce; Defense, Sir George F. Pearce; Postmaster-General, R. A. Parkill; Minister for Trade and Customs, Lieut.-Col. T. M. White; Vice-President of the Executive Council, Senator A. J. McLachlan; Interior, J. A. Perkins; Commerce, F. H. Stewart; Health and Repatriation, C. W. C. Marr.

HISTORY

FINANCIAL AND ECONOMIC RECOVERY. The most significant development in Australia during 1933 was the country's remarkable recovery from the grave economic and financial difficulties experienced since 1929. A rise in the price of wool and wheat, Australia's chief export products; a bumper wool clip of 3,044,000 bales in 1932-33 as compared with the previous five-year average of 2,600,000 bales; the successful conversion of Australian overseas obligations to lower interest rates; and a spectacular rise in Australian securities in London, despite the lower interest—all these factors testified to the success

with which the Lyons government had carried out the so-called Premiers' (Copland) Plan, which had been formally adopted as a method of economic revival on June 10, 1931 (see 1931 YEAR BOOK).

Prime Minister Lyons crowned his government's financial achievements with his budget for 1933-34, presented to the House of Representatives at Canberra, Oct. 4, 1933. He characterized the budget as "a reward which the Australian people have earned by sacrifices made and self-discipline imposed to meet the depression." Announcing a surplus of £3,546,000 in the Federal accounts for the fiscal year ended June 30, 1933, he stated that in 1933-34 taxes would be reduced by £5,440,000 and expenditures increased by £1,212,000. He estimated a budget deficit of only £1,176,000, despite this loosening of the Commonwealth's purse strings. His budget increased old-age and invalid pensions by two shillings sixpence (about 60 cents) weekly, restored part of the emergency cut in public salaries, gave further concessions to dependents of war pensioners, increased the Federal grant to the States by £248,000 and defense expenditures by £1,462,000, and reduced tariff and primage duties, mainly on British imports. At the same time a substantial improvement in the finances of the several States was reported. See under *Finance*.

After having issued some £90,000,000 in Treasury bills to finance public works and stimulate employment, the Federal and State governments, beginning June 30, 1933, were able to return to the open market and raise loans at low interest rates for their financial requirements. The expenditure of £17,300,000 of loan money on public works was authorized at the beginning of the 1933-34 fiscal year. Part of these funds were raised by an internal loan of £5,000,000, which was oversubscribed by £3,000,000. On Sept. 15, 1933, the Commonwealth completed its fifth conversion operation on the London market within a year. About £21,000,000 of 5½ and 6 per cent bonds nearing maturity were converted into 20-year 3¾ per cent bonds. The issue was immediately taken up and shortly afterward commanded a premium of 1½ per cent. Subscriptions for a 3½ per cent internal loan of £10,000,000 were closed on November 17, two days after they were opened, the full amount having been taken. Another £16,647,349 external conversion loan was announced in London December 4, bringing total conversions for the year to £88,212,536.

TARIFF REDUCTIONS. The Lyons government during 1933 continued its policy of gradually modifying the unprecedentedly high tariff established by the previous Labor government. Numerous amendments, designed to bring the tariff schedule in harmony with the trade agreement concluded with the United Kingdom at Ottawa in 1932, became effective Mar. 9, 1933. The tariff changes embodied in the Prime Minister's budget proposals of October 4 went into effect the following day. Most of these reductions gave an advantage to British manufacturers in the Australian market.

SECESSION MOVEMENT. The tariff reductions aroused much opposition among both workers and industrialists in the manufacturing centres of New South Wales and Victoria. In the other States, where agriculture, lumbering, and other primary industries predominated, the reductions were considered as not sufficiently drastic. These

States had long considered themselves victimized by the Commonwealth tariffs for the benefit of the industrial classes. The strength of the secession sentiment in Western Australia was strikingly evidenced in a State referendum on the issue held Apr. 8, 1933, the vote being nearly 2 to 1 in favor of withdrawing from the Commonwealth. On the same day the people of the State voted down a proposal for a convention to modify and reconstruct the Federal Constitution. While favoring secession, the voters ousted the Nationalist-Country party administration of Premier Mitchell, which was strongly secessionist, and placed in office the Labor party, which had opposed the secession agitation.

The secession vote in Western Australia was regarded as merely a gesture of dissatisfaction. No steps were taken by the State's new Labor government to actually withdraw. According to Federal authorities, the only legal step open to the State was to petition the King for the creation of a new Dominion. The reply to such a petition, it was believed, would be that as Western Australia had petitioned to be admitted into an indissoluble partnership, only the other partners could release her. See **WESTERN AUSTRALIA**. To soothe the feelings of the primary producers, Prime Minister Lyons proposed the appointment of a commission to investigate the grievances of Western Australia, South Australia, and Tasmania against Federal economic policies.

Meanwhile a referendum in New South Wales gave a small majority for the State government's proposal to select members of the upper house (Legislative Council) by vote of both houses of the Legislature instead of by appointment by the Crown. The reform was intended to prevent a repetition of ex-Premier J. T. Lang's practice of appointing enough of his adherents to the Legislative Council to nullify the legislation passed by a hostile majority in the lower house. See **NEW SOUTH WALES**.

PREPAREDNESS CAMPAIGN. The Lyons government also reversed the national defense policy of the preceding Scullin (Labor) Ministry, which in 1929 had abolished the compulsory military training system instituted during the Japanese war scare of 1911. The apparent failure of world peace and disarmament efforts and Japanese policy in the Far East led to extensive correspondence between British and Australian authorities. This was followed by the announcement by Sir George Pearce, Minister of Defense, early in October that the government would spend £1,500,000 during 1933-34 for naval construction, improvement of coast and aerial defenses, and the development of munitions factories. The ultimate aim of the Lyons Ministry was a powerful squadron of cruisers and destroyers interchangeable with units of the British navy. Restoration of compulsory military training was also considered.

In connection with its plans to preserve the "white Australia" policy, the government looked favorably upon proposals for the development by a British chartered company of large uninhabited tracts in northern and southern Australia. The proposal for the private development of these areas as stock raising and agricultural regions, respectively, again aroused the historic Australian controversy between the advocates of private and public enterprise.

ANTARCTIC TERRITORY ACQUIRED. By an Order

in Council dated Feb. 7, 1933, the British Crown transferred to the authority of Australia "that part of His Majesty's dominions in the Antarctic Seas which comprises all the islands and territories other than Adelie Land which are situated south of the 60th degree of South Latitude and lying between the 160th degree of East Longitude and the 45th degree of East Longitude. . . ." This territory, much of which had been discovered by Australian expeditions, was formally accepted under the name of the Australian Antarctic Territory by an act of the Australian Parliament approved June 13, 1933.

CABINET CHANGES. On Sept. 21, 1933, Prime Minister Lyons announced the appointment of Stanley M. Bruce as Australian High Commissioner in London, thus automatically removing him from the Cabinet. Mr. Bruce had previously remained in the Cabinet while handling Australian conversion operations in London, but he concurred in the Prime Minister's view that his indefinite continuance as a Cabinet Minister while he was not in Australia would involve a departure from the principle of collective responsibility of the Cabinet.

AUSTRALIAN ANTARCTIC TERRITORY. See AUSTRALIA under *History*.

AUSTRIA. A federated republic of Central Europe proclaimed Nov. 12, 1918, and consisting of the nine provinces of Vienna (City of), Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna (Wien).

AREA AND POPULATION. The census of 1923 showed an area of 32,369 square miles and a population of 6,534,481, of whom 1,865,780 were in Vienna. The estimated population on Jan. 1, 1932, was 6,732,625; that of Vienna in 1930, 1,842,763. The population of the other chief towns in 1923 was: Graz, 152,760; Linz, 102,081; Innsbruck, 56,401; and Salzburg, 37,856. During 1931 there were 106,661 births, 93,846 deaths, and 49,756 marriages; immigrants numbered 2585, of whom 223 went to the United States and 286 to Argentina. Roman Catholics comprise about 94 per cent of the population, with Protestants and Jews accounting for about 3 per cent each.

EDUCATION. Elementary education is compulsory and is provided by the communes and provinces. Public and private elementary schools in 1931-32 aggregated 5342, with 29,383 teachers and 835,348 pupils. The various secondary institutions numbered 159 in 1930-31, with 55,816 pupils. There were also 8 commercial academies, with 3994 students; three State universities with 18,599 students in 1932-33; and a number of technical high schools, theological colleges, and training colleges for teachers. The university enrollment in 1932-33 was: Vienna, 12,870; Graz, 2608; and Innsbruck, 3121.

PRODUCTION. Agriculture is the leading factor in Austria's national economy, but is supplemented by important manufacturing, lumbering and mining industries. Farm production showed a remarkable expansion during the decade 1922-32, as shown in the accompanying table.

In 1930, forests covered more than 37 per cent of the total area of Austria. Of the total timber resources, 83.7 per cent were conifers and 16.3 per cent deciduous trees. Mineral and metallurgical production in 1932 was: Coal, 3,300,000 metric tons (3,200,000 in 1931); pig iron, 94,466 metric tons (145,037 in 1931); steel, 204,-

AUSTRIAN AGRICULTURAL PRODUCTION

Crops	Area in hectares *		Production, metric tons	
	1922	1932 *	1922	1932 *
Wheat	185,968	212,000	201,988	841,800
Rye	337,889	379,700	845,179	605,500
Barley	126,725	169,400	121,909	272,800
Oats	284,771	308,700	265,866	412,700
Corn	60,018	64,700	88,819	140,400
Potatoes . . .	163,220	195,000	1,398,286	2,533,200
Beetroots . . .	11,190	43,700	172,828	1,020,400
Turnips	87,655	92,100	1,214,190	2,294,000
Clover hay . . .	209,422	237,700	525,187	996,900
Hay	1,158,216	1,127,000	2,726,557	3,711,200

* Hectare = 2.47 acres. * 1932 figures are preliminary.

514 tons (322,357 in 1931); sinter magnesite, 19,452 tons; magnesite bricks, 8437 tons; salt, about 75,950 tons. The 1932 cement output was 355,000 tons. Lead and zinc, copper, and crude graphite are other mineral products. The industrial census of 1930 showed 367,458 industrial establishments, with 1,432,936 employees. The clothing industry was the most important. Other important lines were paper, wood products, textiles, iron and metal goods, rubberware, leather goods, glass, earthenware, chemicals, etc. The number of unemployed receiving relief in 1932 averaged 309,000.

COMMERCE. The decline in Austrian imports and exports during the period 1929 to 1932 is shown in the accompanying table.

AUSTRIAN IMPORTS AND EXPORTS, 1929 TO 1933

[In millions of schillings, worth \$0.1407 at par]

	Imports	Exports	Import surplus
1929	3,317.6	2,219.5	1,098.1
1930	2,738.9	1,879.6	859.2
1931	2,210.0	1,326.8	883.2
1932 *	1,402.6	793.8	618.8
1933 *	1,187.4	815.4	372.0

* Figures are preliminary.

The 1932 imports, by commodity classes, were (in millions of schillings): Finished articles, 472.1; foodstuffs and beverages, 351.3; raw materials (except mineral fuel and peat), and semi-manufactured goods, 300.7; mineral fuel and peat, 140.2; live animals, 122.3; gold and silver, 16.0. Exports were divided by classes into (millions of schillings): Finished articles, 552.7; mineral fuel and peat, 0.7; other raw materials and semi-manufactured goods, 168.8; foodstuffs and beverages, 30.8; gold and silver, 22.2; live animals, 8.6. Exports to Austria's chief markets in 1932 (in million schillings) were: Germany, 136.7; Czechoslovakia, 83.5; Italy, 75.5; Hungary, 72.2; Switzerland, 61.1; and Yugoslavia, 57.4. The principal sources of 1932 imports (in million schillings) were: Germany, 285.2; Czechoslovakia, 212.3; Hungary, 136.5; Yugoslavia, 108.0; Poland, 105.8; Rumania, 81.5. Exports to the United States were 15,100,000 schillings; imports from the United States, 56,200,000 schillings.

FINANCE. Closed financial accounts of the Federal government for the fiscal calendar year 1932 showed a deficit of 15,000,000 schillings, as compared with a deficit of 322,000,000 schillings in 1931. Expenditures in 1932 amounted to 1,920,000,000 schillings and revenues to 1,905,000,000 schillings, as compared with 1931 expenditures of 2,330,000,000 schillings and revenues of 2,008,000,000 schillings. Of the 1932 revenues, taxation accounted for 1,049,000,000 schillings. The re-

vised budget for 1933 estimated total revenue at 1,288,500,000 schillings (1,054,900,000 schillings from taxation) and total expenditure at 1,288,700,000 schillings, the estimated deficit being 200,000 schillings. See *History* for 1933 financial developments. The schilling has a mint par value of \$0.1407 gold and exchanged at an average of \$0.1396 in 1932.

The public debt on Dec. 31, 1932, aggregated 2,991,000,000 schillings, of which 2,226,400,000 schillings represented the foreign and 764,600,000 the internal debt. The foreign debt included the unsettled part of the prewar debt as well as 137,100,000 schillings raised in 1930, 270,000,000 schillings in 1931, and 266,800,000 schillings in 1932. A new loan, the proceeds of which aggregated 237,400,000 schillings, was advanced to Austria by France, England, Italy, and Switzerland in October, 1933. Austria suspended service on its foreign debt in foreign currencies on June 24, 1932.

COMMUNICATIONS. Austrian railways in 1931 had 4154 miles of line, of which 3609 miles of state and private lines were operated by the state and 545 miles by private companies. In the same year the railways carried 92,000,000 passengers (104,000,000 in 1930) and 26,600,000 metric tons of freight (31,000,000 tons in 1930). Highways in 1931 extended 21,273 miles, of which 2450 miles were national roads. In 1933, the government appropriated \$9,160,000 for the construction of 206 miles of new highway and the improvement of existing roads. A series of regular air lines were operated by the state-subsidized Austrian Air Transportation Company.

GOVERNMENT. The Constitution of Dec. 7, 1929, vested executive authority in a President elected for six (later changed to four) years, who appointed the ministry and had power to dissolve Parliament. There was a lower chamber (Nationalrat) of 165 deputies elected for four years and an advisory upper chamber (Bundesrat) of 50 members chosen by the provincial Diets. The lower chamber elected Nov. 9, 1930, was composed of 72 Social Democrats, 66 Christian Socialists, 10 Agrarians, 9 Pan-Germans, and 8 Heimatblock representatives. President in 1933, Wilhelm Miklas (Christian Socialist), reelected Oct. 9, 1931. The Ministry appointed May 20, 1932, was a coalition of the Christian Socialist, Agrarian, and Heimatblock parties. The principal members were: Federal Chancellor, Minister of Foreign Affairs, Agriculture and Forestry, Dr. Engelbert Dollfuss (Christian Socialist); Vice-Chancellor, Franz Winkler (Agrarian); Defense, Karl Vaugoin (Christian Socialist); and Finance, Dr. Emanuel Weidenhoffer (Christian Socialist). For changes in 1933, see *History*.

HISTORY

The profound readjustment of European diplomatic alignments following the advent of the Hitler régime in Germany on Jan. 30, 1933, was nowhere more dramatic and significant than in Austria. Before Hitler became Chancellor of Nazi Germany, the Austrian people overwhelmingly favored union with Germany. Their government, headed by Engelbert Dollfuss, was actively aligned with Germany, Hungary, Bulgaria, and Italy in demanding revision of the territorial clauses of the Versailles Treaty. However, when Hitler showed his hand by forcibly "coördinating" all opposition elements in the Reich, large sections of the Austrian population

lost their enthusiasm for "*anschluss*" (union). The Dollfuss government executed a diplomatic *volte-face* and vigorously rebuffed the efforts of the German and Austrian Nazis to seize control of Austria. Vienna became the focal point of the diplomatic maneuvering by which Italy, France, and Great Britain sought to check the expansion of Germany. In the course of the struggle against the Nazis, Austria evolved a new governmental system, which was Fascist in complexion, but which showed distinct divergences from the Fascist governments of Italy and Germany.

THE HIRTENBERG ARMS AFFAIR. The revisionist sympathies of the Dollfuss government were dramatically exhibited early in 1933. On January 8 the organ of the Austrian Socialist party revealed that on December 30 some 60,000 rifles and 200 machine guns had been shipped from Italy to the Hirtenberg arms factory in Austria, from where half of the arms were forwarded to Hungary. The revelation caused a great outcry in the Little Entente states (q.v.), where it was generally believed that Italy was arming the Austrian Heimwehr (reactionary bourgeois militia) and the Hungarian Fascists in preparation for a joint attack upon the peace treaties. Holding that Austria had violated a clause of the Saint-Germain Treaty prohibiting the importation of arms and ammunition, the Little Entente demanded that the case be placed before the League Council. To French and British inquiries, Chancellor Dollfuss replied on February 2 that the arms had been sent to Austria by a private Italian firm for repairs, and would be returned to Italy as soon as these were completed.

This failed to satisfy the Little Entente, however, and on February 11 France and Great Britain jointly notified Austria that they would withhold their shares of the Lausanne loan to Austria unless the arms were either returned to Italy or destroyed within two weeks. On February 21, Chancellor Dollfuss promised the British and French informally that the arms would be returned to Italy and the incident was considered closed. However, the vigorous denunciation of the Anglo-French action by the Italian press and the sympathetic support of Austria by the press in Germany, Hungary, and Bulgaria clearly indicated their community of interest. The incident was responsible for the closer unification of the Little Entente in a convention signed February 16.

At the Geneva Disarmament Conference on March 7, Austria again showed its diplomatic cooperation with Germany by voting with Germany, Italy, Hungary, and the Netherlands against the principle of the French security pact (see **DISARMAMENT**). But already the schism between Nazi Germany and its erstwhile allies had begun to appear.

AUSTRIA RESISTS THE NAZIS. The sweeping victory won by Hitler's National Socialists in the German election of March 5 precipitated a political crisis in Austria. The Austrian section of the Nazi party, with the vigorous support of Hitler and of his propaganda organization, was rapidly winning adherents among the small bourgeoisie and the unemployed of all classes in Austria. The Catholic and bourgeois groups represented in the Dollfuss government had only a slight majority in Parliament over their Hitlerite opponents on the Right and the powerful Socialist party on the Left. While long divided on internal policies, the Socialists and the Christian

Socialists (Roman Catholics) united in opposing Hitlerism. Both opposed union of Austria with Germany so long as the Reich was under Nazi domination and both opposed the holding of new Austrian elections, fearing a large increase in the Nazi representation in Parliament.

A great mass meeting of Austrian Nazis in Vienna, at which union with Germany was demanded, moved Chancellor Dollfuss to act to forestall a threatened Hitlerite *putsch*. On March 7, with the approval of President Miklas, he proclaimed a dictatorship. All political meetings and parades were prohibited. Restrictions imposed upon the press prevented the publication of Nazi propaganda. Infuriated at what they considered to be treason to the German race, the Hitlerites expanded their violent propaganda in Austria. Hitler's emissaries campaigned for his cause in every Austrian province. The German government spent large sums in support of the Austrian Nazis. German airplanes scattered Nazi pamphlets upon Austrian cities and appeals to the Austrian people were broadcast from German radio stations near the border.

Chancellor Dollfuss met this onslaught with a firmness which aroused much admiration in countries antagonistic to Germany. He dissolved Parliament, abolished freedom of speech, press and assemblage, forbade Austrians to wear the Nazi uniform, and barred the Nazis from the radio. On May 13 Dr. Frank, Bavarian Minister of Justice, and other German officials were informed upon their arrival in Vienna that their presence was "not particularly desired by the government." Hitler's government answered this snub by barring German tourists from Austria with a prohibitive visa fee. Dollfuss then forbade Austrians to visit the Reich except on urgent business. On June 12, the Austrian government expelled the German Nazi leader, Theodore Habicht, who had been promoting the Nazi cause in Austria. Two days later the Germans arrested the Austrian press attaché in Berlin. Meanwhile the Nazis in Austria resorted to bombings, shootings, and other violence against government officials. Accordingly on June 19, Herr Dollfuss outlawed the Nazi party throughout Austria and ordered their Storm Troops disbanded. To prevent the Nazis from winning control of any provinces, he lifted a page from Hitler's book and appointed special Commissioners of Public Safety in each province. He required all state employees, both active and retired, to take a new oath of loyalty to the government.

THE POWERS SUPPORT DOLLFUSS. In his fight to prevent Austria's absorption by the Reich, Chancellor Dollfuss won strong support not only in France and Great Britain but also in Italy. Mussolini was not anxious to see a Greater Germany of 80,000,000 inhabitants fronting Italy's northeast boundary, particularly in view of the fact that Hitler's programme called for the annexation of the German-speaking districts of the Italian Tirol. At the World Economic Conference in London, Dollfuss placed Austria's plight before the French, British, and Italian representatives. As a result, it was announced June 15 that they would issue their shares of the Lausanne loan (amounting to \$40,000,000) arranged in Austria's behalf a year earlier.

Shortly after Easter and again in August, the diminutive Austrian Chancellor visited Mussolini in Rome and won further support for his country's independence. On August 6 France and

Great Britain protested to Germany against German policy toward Austria, reminding the Reich that both the Treaty of Versailles and the newly signed Four-Power pact guaranteed the independence of Austria. Italy also remonstrated with Berlin and was assured by Hitler that the Reich would attempt to moderate the anti-Dollfuss agitation. Protests and remonstrances, however, proved of little practical effect. Premier Daladier of France announced on August 27 that France was resolved to "guarantee" the independence of Austria. Immediately afterwards Great Britain, France, and Italy released Austria from the military limitations imposed upon her by the peace treaties and permitted the temporary increase of the army by an auxiliary force of 8000 men.

THE NEW AUTHORITARIAN STATE. Having succeeded in temporarily repulsing the Nazi onslaught and reawakening a spirit of nationalism among his people, Chancellor Dollfuss on September 11 announced his plans for converting Austria into "an authoritarian state, based on corporations and formed on occupational lines." He declared the period of the liberalistic and capitalistic systems had ended, as had "socialist misguidance," but that the new state would reject "coördination and terrorism." While indicating his preference for a semi-Fascist government, the Chancellor denied that he planned to copy either the Italian or German systems. He clarified his intentions on September 21 by forming a new cabinet, in which he held five portfolios. Two of the strongest personalities in the previous ministry were eliminated—Franz Winkler, Democratic Peasant party leader, who had opposed the Fascist aspirations of the Heimwehr, and Karl Vaugoin, Minister of Defense in 16 previous Cabinets. Dr. Dollfuss denied that the new government cherished dictatorial intentions. He said it was "merely a step toward . . . a Christian, German corporative state under authoritarian leadership."

The composition of the Cabinet was: Chancellor and Minister of Foreign Affairs, Defense, Security, and Agriculture, Dr. Engelbert Dollfuss; Vice Chancellor, Maj. Emil Fey; Justice and Education, Dr. Kurt Schuschnigg; Finance, Dr. Karl Buresch; Trade, Fritz Stockinger; Social Welfare, Richard Schmitz; Minister without Portfolio, Dr. Otto Ender. The Cabinet took no definite steps to change the existing form of government during the remainder of the year.

NAZIS CONTINUE STRUGGLE. While the Chancellor was engaged in formulating the bases of a new constitution acceptable to the bulk of the people, the Nazis continued their violent agitation against his government. On October 3, an adherent of the Austrian Nazi party attempted to assassinate Dr. Dollfuss in Vienna. The Chancellor suffered only slight bullet wounds and a few hours later assured the country by radio that he would carry on the government as usual. Large Nazi demonstrations in Vienna on October 15 were broken up by the police. The next day it was announced that a Nazi conspiracy in the army for the seizure of the Linz garrison had been frustrated by some 20 arrests. On October 21 the government arrested the German Nazi Prince Bernhard von Sachsen-Meiningen and his wife at Klagenfurt for conducting a Nazi conspiracy against Austria.

Renewed Nazi terrorism was met by the establishment of concentration camps on the German

model, in which the adherents of Hitler were imprisoned. Martial law was proclaimed throughout the country on November 10 to prevent Nazi and Socialist demonstrations on the 15th anniversary of the republic. Despite the temporary success of the Chancellor's moves, it became evident toward the end of the year that he was losing ground in the fight with Hitlerism. This was attributed partly to dissension among his supporters—the Heimwehr and the poorly organized groups of peasants and Roman Catholics—and partly to growth of the Nazis by accessions from the Socialists. The Heimwehr, under Prince Ernst Rüdiger von Starhemberg, brought constant pressure upon the Chancellor to outlaw the Socialists and political parties and establish a Fascist state on the Italian model, independent of Germany. The peasants and clergy wanted a non-Fascist, Catholic, conservative state, in which Socialists and Nazis alike would be banned. Their chief organization was the National Corporative Front, headed by Franz Winkler, former Vice-Chancellor.

Increasingly violent clashes between these two groups led Herr Dollfuss on November 24 to ban all political meetings from Dec. 1, 1933, to Jan. 15, 1934. On December 22 an Episcopal Letter from the Austrian bishops was read in Roman Catholic churches in Austria. It enjoined all Catholics to support Chancellor Dollfuss in his struggle against his enemies, particularly the Nazis. Meanwhile many Socialists were being driven into the ranks of the Austrian Nazis by the Chancellor's progressive emasculation of the Socialists' social welfare programme in Vienna. One-third of the city's revenue was cut off by national decrees, particularly those repealing the city taxes on excess profits and on servants.

ECONOMIC AND FINANCIAL CONDITIONS. While the government was engaged in its strenuous efforts to preserve Austria's political independence, its economic dependence upon other nations became more evident. Economically, the country had deteriorated steadily during the course of the world depression, particularly after the financial crisis of the summer of 1931 had further obstructed Austria's important function as middleman for the commerce and trade of south central Europe. The beginning of 1933 found economic activity reduced to a minimum. There was little traffic on railways and highways. In Vienna, amusement houses were almost deserted while mendicant singers and musicians thronged the streets. In the provinces, government efforts to collect taxes from the sorely distressed peasants led to tax riots and sporadic uprisings necessitating the calling of troops. The taxi drivers abandoned their cabs in the streets of Vienna in protest against taxation.

The government's financial deficit for the first three months of the year far exceeded the estimates. Accordingly, the Cabinet on April 24 slashed 70,000,000 schillings from the budget expenditures and discontinued the sinking-fund payments of 13,500,000 schillings, which represented a part of the government's obligation to the National Bank in connection with the reorganization of the Credit-Anstalt. The Credit-Anstalt was the great Austrian private bank, whose threatened failure precipitated the European financial crisis in 1931. Preliminary returns of the 1933 budget operations showed a deficit of 244,100,000 schillings.

The reorganization of the Credit-Anstalt was furthered during 1933. On April 27, the bank's

agreement with its foreign creditors was amended to permit the government to withhold actual cash payments during a standstill period until Mar. 1, 1935. The outstanding foreign assets of the bank were taken over on July 31, 1933, by the holding company established under the provisions of an agreement with the creditors. The holding company, with its legal office in Monaco and head office temporarily in Paris, had representatives of the American, British, French, Dutch, German, and Italian creditors on the board. Of the holding company's capital of 30,000,000 schillings, 20,000,000 schillings was acquired by the Credit-Anstalt, while a preferred block of 10,000,000 schillings was distributed among the foreign creditors. It was stipulated that a 5 per cent dividend must be declared on the preferred block before the other shares participated. A preferred 5 per cent bond issue of 130,000,000 schillings was also given over to the foreign creditors.

THE LAUSANNE LOAN. The international loan to Austria, provided for at the Lausanne Reparation Conference in 1932 in order to stave off economic collapse in that country, was issued in the autumn of 1933. France, England, Italy, and Switzerland contributed 237,400,000 schillings (France, 100,000,000; England, 100,000,000; Italy, 30,000,000; and Switzerland, 7,400,000). Belgian, Dutch, and Czechoslovak loans, aggregating about 12,000,000 schillings, were later advanced. The proceeds were used by the Austrian government to consolidate the floating debt, liquidate outstanding transfer payments, and stabilize the currency.

The Lausanne loan, together with an internal loan of about 200,000,000 paper schillings issued in October, assisted the upward trend of business which commenced during the summer. The number of registered unemployed declined from 291,224 on August 31 to 279,053 on September 30.

See GERMANY, ITALY, FRANCE under *History*; FASCISM; LITTLE ENTENTE.

AUTHORS' LEAGUE OF AMERICA. A national organization of authors, dramatists, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The league supplies to its members confidential information relating to publishers, theatrical and motion-picture producers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material. The league includes the dramatists' guild, the authors' guild, and the screen writers' guild. Closely affiliated with it is the Authors' League fund, an agency formed by the league to meet its obligations with respect to the care of the sick, the aged, and the unfortunate, the endowment amounting to about \$80,000. The officers in 1933-34 were: President, Marc Connelly; vice president, Elmer Davis; secretary and treasurer, Luise Sillcox. Headquarters are at 9 East Thirty-eighth Street, New York City.

AUTOMOBILE RACING. Louis Meyer, of California, took undisputed leadership of the automobile racing field in 1933, winning the Indianapolis 500-mile race on Memorial Day at an average speed of 104.162 m.p.h., and also taking

the A.A.A. title, with a total of 610 points. In winning the Indianapolis race, Meyer became the second man to win the race twice; Tommy Milton was the other double winner. Wilbur Shaw was second at Indianapolis and Lou Moore third. In the A.A.A. championship series, Moore was second with 530 points and Shaw third with 450.

Mark Biltman and Les Spangler, drivers, and G. L. Jordan, Spangler's mechanic, were killed at Indianapolis when their cars shot over the retaining wall after collisions. At Los Angeles in April, Bob Carey, A.A.A. winner in 1932, was killed when his car hurtled into the guard rail.

Sir Malcolm Campbell, on Feb. 22, 1933 at Daytona Beach, Fla., set a new world's speed record for automobiles by sending his 2500-horse-power car over the sand at 272.108 m.p.h., thus bettering his record of 253,968 m.p.h. made last year over the same course.

AUTOMOBILES. Accepted as one of the indices of general business conditions, automobile production is always regarded as significant. That the production of cars and trucks in 1933 (2,048,000 in the United States and Canada) was 43 per cent above that of 1932 indicated that the upturn had finally come after the most prolonged depression this country has ever known. The automobile industry was, in fact, a major influence in leading the country out of the depression because it is the largest purchaser of gasoline, rubber, alloy steel, malleable iron, mohair, upholstery leather, lubricating oil, plate glass, nickel, and lead.

Throughout the year there was high activity in the laboratories and on the proving grounds of the manufacturers, as was evident when the new models were revealed, but their announcements were nearly all withheld until at or just before the opening of the New York Show. Ford, for the first time, led in the introduction of new models, which were shown in the Ford Shows at Detroit and New York in December.

Aërodynamic body lines and independently sprung front wheels were the outstanding new features but there was considerable diversity in their application. For many years automobile body styles have followed the fashion, so to speak, and have been more or less standard for their period. Any departures from former styles either "took" or did not and usually were either abandoned the next year or generally adopted. The engineers long since established the so-called "tear-drop" design as the ideal for minimum wind resistance but it was considered too radical to be accepted by the motoring public unless it were reached by easy stages. The boldness of one or two manufacturers a year ago encouraged the industry and this year the transition is plainly in progress. Differing in their degree of daring has given the different makes enough individuality so that during this stage at least it will once more be possible to identify a car without reading its name plate or hub caps.

In general there is more pointing and sloping of the front radiator grille and more filling in of the troughs between the front fenders and engine hood. Most extreme in this regard were the Chrysler and De Soto which carry the hood contour across and down to the fenders, incorporating the radiator grille and head lights in the vertically rounded front. In practically all makes the rear treatment has done away with all vertical surfaces and angles, the profile curving downward from the roof and sloping off with a slight up-

curve to the rear fender tips, some including a luggage space or tire compartment, as in the Hudson, leaving the rear practically smooth except for the bumpers, the gasoline filler cap and the tail lights, and some of the latter have been nearly absorbed into the rear fenders.

Independent front wheel springing, described as "knee action" by General Motors, is either standard or optional equipment on about half of the 1934 lines. While new in American car design, it has been in use on European cars for several years and even longer in airplane landing gear. Means for accomplishing it differ but the effect is essentially the same in all, i.e. to allow either front wheel to ride over a bump without jolting the passengers. With most of these articulated front wheel suspensions, heavy coil springs replaced the conventional leaf springs; the Hudson and Terraplane, however, adhere to the latter in their "Axleflex" construction, as do also the Nash and the new LaFayette. Besides improving riding qualities, springing the wheels separately reduces the tendency for front wheels to shimmy or tramp or cause steering wheel reaction.

Reo, by its announcement in May of an automatic gear-shifting transmission, pioneered what may prove an epochal advance in automobile construction, although nothing of the kind was adopted by any other maker for 1934. It dispensed with the manual gear-shift lever, the mechanism automatically selecting the right gear for the speed, load, and grade conditions.

The new Graham had the distinction of being the first production car to apply the racing-car practice of using a supercharger—a device for augmenting the air-intake for the fuel mixture.

Among other improvements, or extended use of them, should be mentioned automatic chokes to facilitate starting, and doing away with a separate starting switch pedal, having it actuated by the depressing of the accelerator or clutch pedals, or by a button on the dash. Vacuum-operated brakes and clutches were shown on many makes. The use of larger, lower pressure tires was found to be more general, and nearly all makes had provision to effect ventilation without drafts. Free-wheeling appeared to be waning in popularity. Several cars dropped it, others furnished it only as an option at extra price and those that had it as standard equipment put little emphasis on that feature. Aluminum cylinder heads were new on several lines.

Ford, discontinued the four-cylinder models (making only the V-8), which left the Austin, Willys, and Continental as the only remaining fours. Continental dropped its sixes.

From the roster of car names, another old one disappeared—the Peerless, the manufacture of which was discontinued. Another old one reappeared but in a lower priced group—the La Fayette, once in the Cadillac and Lincoln class, was acquired by Nash a few years ago and subsequently discontinued. As an addition to its 1934 offerings, Nash has given the name to a line of shorter wheelbase sixes. Hupp and Oldsmobile were others of the older car builders to enter a six in the low-priced field. The industry as a whole showed effort to meet the increased demand for low-cost transportation caused by the depression and all 1934 models were priced surprisingly low considering the greater cost for materials and labor brought about by the N.R.A.

AUTO INDUSTRIES COMES. Under the National

Industrial Recovery Act the automobile industry was among the first to prepare a code which was signed by all of the car manufacturers except Henry Ford, who, however, complied in general with its requirements. It became effective September 5, 1933 and provided for an average maximum of 35 hours a week per person, with not more than 48 hours per week in any one week and minimum rates of 40 to 43 cents an hour according to the size of the city. Salaried workers receiving less than \$35 a week were to work a maximum of 40 hours weekly average and not more than 48 in any one week. The National Automobile Chamber of Commerce was named as code authority for the industry. The act provided that workers should have the right to organize and bargain collectively. This was the only code in which the constitutional right of employers to select, retain, or advance employees on the basis of individual merit was explicitly stated. The code was to remain in effect until Jan. 1, 1934 but late in December, the President approved its extension, including the much-discussed "merit" clause, until Sept. 4, 1934. There was also granted an increase of the average weekly hours from 35 to 40 per week which was made retroactive to Sept. 5, 1933 as the effective date.

The Motor Vehicle Retailing Trade Code developed by the National Automobile Dealers Association, was signed by the President, October 3. It applied to vehicle retail sales establishments, but provided for later submission of supplementary regulations for dealers engaged in service and repair work covering unfair and destructive practices. Establishments were to be kept open not less than 52 hours a week, unless shorter hours had been kept prior to July 1, 1933. Excepting outside commission salesmen, watchmen, and salaried employees receiving \$30 weekly or more, employees were placed on a maximum 44-hour week. Minimum pay was set between \$13 and \$15 weekly according to the size of the city, and not less than 40 cents an hour. Used car trading allowances were placed under N.A.D.A. regulation and penalties provided for misleading and unfair selling and advertising methods. A merit clause was not allowed but rules to prevent the cutting of selling prices were, which should stop one of the greatest trade evils.

In addition there were specific codes for various branches of the industry, those approved including Storage Battery, Automotive Parts and Equipment, Motor Bus Operators, Motor Fire Apparatus, Funeral Vehicle and Ambulance, Storage and Parking Trade, Rubber Manufacturing, Wholesale Automotive Trade, Automotive Maintenance Garage Trade and Brake-Lining Codes. Price fixing desired by some manufacturers was not obtained, but apparently minimum prices may be established in certain agreed instances. Other codes were pending at the close of the year for the Automobile Laundry Trade, Drive-It-Yourself Industry, Finance Companies, Retail Rubber Tire and Battery Trade, Taxicab Business, Trailer Manufacturing, and American Trucking Associations.

STATISTICS. Of the 2,048,000 total production of cars and trucks in the United States and Canada previously mentioned, 1,685,000 were passenger cars and 363,000 motor trucks. Of the passenger cars, 81 per cent, or 1,535,000 were closed models. The wholesale value of the passenger cars was \$795,200,000 and of the motor trucks, \$175,000,000, or a combined total of \$970,200,000. The

average factory price of cars was \$630 and of trucks \$645.

Tire factories, during the year, shipped a total of 43,000,000 casings. The wholesale value of rubber tires sold for cars in use, that is, not including those sold to car factories for new car equipment, was \$260,000,000. The wholesale value of parts and accessories for replacements and service equipment was \$425,728,000. The year's total business for the manufacturers of motor vehicles, accessories, service equipment and replacements of parts and tires was \$1,655,928,000, a better than 26 per cent increase over that of 1932. The retail value, including taxes, of the gasoline consumed by motor vehicles was \$2,227,000,000.

In spite of the increased production of motor vehicles, the registration of motor vehicles in the United States fell off from the 1932 figures, showing that cars were being worn out and discarded faster than they were being replaced and hence promising an increased market for the year ahead. The total registration at the end of 1933 was 23,720,000, made up of 20,525,000 cars and 3,195,000 trucks. This was 72 per cent of the estimated number of cars in use throughout the world—32,820,000. Over a quarter of the motor trucks in use in this country belong to farmers—830,000, and they own about a fifth of the passenger cars—four million, roughly.

A reflection of State and Federal efforts to give work to the unemployed was shown in the increased new road construction, the number of miles of surfaced highway having increased from 868,000 in 1932 to 920,000 in 1933. During the year there was spent on highways and streets, \$1,550,000,000. The total miles of highways in the United States now is 3,040,000.

Still mounting is the levy of taxes against motor vehicle users, the total of which in 1933 was \$1,170,000,000. Of this, \$716,000,000 was collected as Federal, State, and municipal gasoline taxes. Motor users paid 11 per cent of all taxes collected, including Federal, State, and local.

The automobile industry is one of the best customers of the railroads for in 1933 there was shipped 2,621,000 tons of automotive freight. Of the entire production of various commodities it is interesting to notice what large percentages in 1933 went to the automobile industry: 80 per cent of the rubber, 38 per cent of the plate glass, 15 per cent of the iron and steel, 14 per cent of the lumber and hardwood, 11 per cent of the copper, 10 per cent of the lead, 25 per cent of the aluminum, 28 per cent of the nickel, 85 per cent of the gasoline, and 59 per cent of lubricants. In barrels of 42 gallons each, motor vehicles consumed 320,000,000 of gasoline and 9,500,000 of lubricating oils and greases. The crude rubber used by the motor industry in 1933 was 716,800,000 pounds and of cotton fabric used in tires 185,000,000 pounds.

Of the three million odd trucks in use in this country, there are so many operated by fleet owners of as high as a thousand or more trucks, it is rather surprising to know that there are about two and a half million motor truck owners. Only about 5½ per cent of all trucks are operated as common carriers and of these, only 5 per cent do an inter-state business, 4.45 per cent being operated in the confines of one State. Contract carriers represent about 9 per cent of all trucks, and 86 per cent are privately owned and operated. The total of motor truck taxes was \$295,000,000 in 1933. Although representing only 13 per cent

of all motor vehicles, trucks pay 25 per cent of all motor taxes.

There was an increase of about 6000 in the number of motor busses in use during the year; the total reaching 105,000. Of these 45,000 were in revenue services. In local or transit service were 17,500. About 21,500 consolidated schools were using motor transportation, to the number of 60,000 busses. Sixty steam railroads and 235 street railways were operating motor busses, the latter having 12,225 busses.

The falling off in motor vehicle exports last year was happily reversed in 1933, there being a 29 per cent increase. The number of American motor vehicles sold outside of the United States, i.e. including United States exports and the output of United States owned Canadian plants, was 233,000. The per cent of the total production sold outside of the United States was 11.5. The value of motor vehicles, parts and tires exported from the United States and Canada was \$135,000,000.

There was only a very slight increase in mortality in the motor vehicle retail business during the year. The heaviest was among car and truck dealers, the number decreasing about three thousand, leaving 36,500 in business at the end of the year. Against this was some increase in the number of garages, service stations, and repair shops which reached 98,161. Supply stores were somewhat fewer—60,865 but the total of retail outlets, with all duplications eliminated, was 103,161 as compared with 103,005 in 1932. Wholesalers numbered 5465. Gasoline filling stations fell off in number from 350,000 in 1932 to 317,000 in 1933.

LEGISLATION. About 8500 bills affecting highway transportation were introduced at the regular sessions of the 43 State legislatures that sat in 1933. Between 1000 and 1200 of these became laws. In addition about 1000 bills relating to vehicles or their use were presented in the 43 special sessions held, of which approximately 100 were enacted into laws. Many bills that were regarded as inimical to the interests of car builders, the trade or users were lost. Probably most displeasing of the laws that passed were those that increased taxation. Anything that increases the cost of making, selling, or operating motor equipment is especially burdensome in difficult times and some States seemed to realize this. There appeared to be a trend toward the reduction of the fees for private passenger cars—only two increases out of 16 changes—and also a marked reduction in fees for light-weight property-carrying vehicles. Heavier property carriers fared not so well. Common carriers and contract carriers suffered increased fees in several States.

Only one State increased its gasoline tax, Oregon increasing from 4 to 5 cents, but four States replaced or continued expiring one-cent additional special taxes—Arizona, Florida, New York, and Tennessee. Most alarming was the increased diversion of these taxes to others than the one purpose for which motor interests concede them to be justified—road maintenance. Gasoline tax reductions were sought in many States but none obtained. The Federal gas tax of one cent was increased $\frac{1}{2}$ cent in the spring with the promise of its removal if the Prohibition amendment was repealed, giving the government new revenue from liquor taxes, and it was removed at the end of the year. Texas, the largest gasoline producing State passed a resolution asking for its entire repeal by June 1, 1934.

Also unpopular with highway users is restric-

tive regulation not required from safety considerations. There was considerable such legislation, especially against commercial vehicles and stimulated by those interested in competitive forms of transportation.

Throughout the country there was greater effort than ever before to classify all carriers as common, contract and private carriers and to bring as many vehicles as possible under the first two classifications for their more rigid regulation. Nearly every State that does not already regulate contract carriers introduced bills to do so, indicating a disposition to bring them under nearly as complete regulation as common carriers, even to the extent of fixing the rates that they may charge. Still more resented was the effort to extend regulation to private carriers. It was accomplished in Ohio, Oregon, and Washington, and that already in force in Oklahoma was broadened. Michigan, North Dakota, Oregon, Utah, Washington, and Wisconsin increased regulation or taxes on trucks. Oregon's new law particularly was regarded by many as unwarrantably rigorous.

In the matter of non-resident privileges there was some improvement in reciprocity enactments, but there was more or less curtailment of these privileges in nine States.

In size limitations five States reduced height limits, two increased allowable widths. Permissible lengths of single vehicles were shortened in four and extended in seven States. As to weight limitations there were some changes in laws with respect to distribution of load, but where the allowable gross weights were revised as many States raised the limit as lowered it.

Thirteen States restricted the working hours of truck drivers, ranging from eight in Indiana to 14 in Ohio. Nine States made the limit 12 hours.

Trailer use suffered further restriction. Connecticut barred, outside of municipalities, and South Carolina altogether, the operation of full trailers, i.e. those whose load is entirely borne on its own axles as distinguished from semi-trailers, part of whose weight is carried by the towing tractor or truck. Minnesota limited trailer gross weights to 6000 lbs., Tennessee to one ton, and Massachusetts to 1000 lbs. load capacity for full trailers after Jan. 1, 1936.

Four States enacted laws requiring use of safety glass. Nebraska and Pennsylvania made its use compulsory throughout for busses built after Jan. 1, 1934 and all vehicles built after Jan. 1, 1935. After that date New Jersey will require all new vehicles to have it where specified by the Commissioner of Motor Vehicles. All new vehicles in New York next year must have it throughout.

Minnesota and Washington adopted a uniform operators' license law. Altogether 27 States (besides the District of Columbia) now require the driver as well as the vehicle to be licensed. Several other States amended their operators license laws in respect to certain details such as the minimum and maximum age limits, nature of tests for driving ability, fees, or period of the license.

Five States enacted new laws relating to financial responsibility. Of the 22 States that now have some statute of this nature more than half follow the general lines of the Model Safety Responsibility Bill of the American Automobile Association which provides that upon establishment of certain violation of laws or regulations, operator's, chauffeur's, and car licenses shall be revoked and cannot be reinstated until the owner has estab-

lished financial responsibility, as by the taking out of liability insurance, and has settled any judgments against him for a motor vehicle accident.

AVIATION. See **AERONAUTICS.**

AZERBAIJAN, á'zér-bá-é-ján'; á'zér-bí-ján'. On Apr. 28, 1920 the Azerbaijan Socialist Soviet Republic was formed, and on Jan. 16, 1923 united with Georgia and Armenia to form the Transcaucasian Socialist Federated Republic (q.v.) of the U.S.S.R. It is situated on the southwestern coast of the Caspian Sea and extends from the Caucasus Mountains in the north to Persia in the south. Area, which includes the Autonomous Nakhichevan Soviet Socialist Republic and the Nargorni Karabakh Autonomous Region, 32,686 square miles; population (Jan. 1, 1931), 2,510,800 of which about 70 per cent were Moslems. The capital Baku had a population of 453,000 in 1926.

Elementary and secondary schools had 335,000 students in 1932. The chief agricultural products are grain, cotton, vegetables, tobacco, and silk. Cattle breeding is carried on by the people in the mountain regions. The total area under cultivation in 1929-30 was 2,717,000 acres, and in 1932 the area devoted to cotton was 565,630 acres. The chief industry is the production of oil, principally around the city of Baku to which all the other oil fields are connected. Oil production in 1931 amounted to 13,443,000 tons (in 1929-30 it was 10,900,000 tons). The copper, salt, fishing, and textile industries, are also important; production of state industries (except oil) in 1929-30 was valued at 75,900,000,000 roubles (1 rouble equals \$0.5146 in the U.S.S.R.). See **UNION OF SOVIET SOCIALIST REPUBLICS.**

AZNAR, ADMIRAL JUAN BAUTISTA. A Spanish statesman and naval officer, died in Madrid, Feb. 19, 1933. Born in 1861, he attended the San Fernando Naval School and entered the Spanish Navy in 1874. While serving during the Spanish-American War he was taken prisoner on the sinking of the cruiser *Vizcaya*, of which he was lieutenant commander, by the American fleet in Santiago harbor, July 4, 1898. He was later promoted to the rank of captain-general in charge of the naval region of Cartagena, and in 1921 directed the naval operations on the coast of Morocco after the crushing defeat of the Spanish troops by Riff warriors at Anual. In December, 1933, he was appointed Minister of Marine in the cabinet of the Marquis of Alhucemas, resigning on the establishment of the dictatorship of Primo de Rivera in September, 1923.

Admiral Aznar became Premier Feb. 18, 1931, but though highly respected he was not equal to the impossible task of saving the monarchy in the face of dissatisfaction with the conditions of dictatorship under which Spain had labored for seven years and profound economic distress. The republic was accordingly proclaimed on Alfonso's abdication on April 14. At the time of his death he held the honorary title of captain-general of the Spanish fleet.

AZORES, á-zôrz'. An archipelago in the North Atlantic Ocean about 800 miles west of Portugal integral part. Area, 922 square miles; population (1930 census), 253,596. Angra, the capital, had 10,057 inhabitants in 1926.

of which country the Azores are politically an

BABBITT, IRVING. An American educator and critic, died in Cambridge, Mass., July 15, 1933. He was born in Dayton, O., Aug. 2, 1865, and received his education at Harvard University, graduating in 1889. After studying in Paris during 1891-92 he was appointed instructor in Romance languages at Williams College and in 1894 was called to Harvard as instructor in French. In 1902 he was made assistant professor and in 1912 professor of French literature. He also lectured after 1920 at Kenyon College, Yale University, Stanford University, Amherst College, and the University of Toronto, and in 1923 was Harvard exchange professor at the Sorbonne in Paris.

With Paul Elmer More, Professor Babbitt founded the modern humanistic movement, a form of pragmatism that attempted to counter-act the post-war ascendancy of naturalism or Rousseauism by glorifying the intellect and free will in terms of a universal animism and seeking to re-establish a spirit of individualism in American life. Its ideals were set forth in his *Literature and the American College: Essays in Defence of the Humanities* (1908); *The New Laokoon* (1910); *The Masters of Modern French Criticism* (1912); *Rousseau and Romanticism* (1919); and *Democracy and Leadership* (1924). He also contributed to numerous magazines and reviews and edited Taine's *Introduction à l'histoire de la littérature anglaise* (1898); Renan's *Souvenirs d'enfance et de jeunesse* (1902); Voltaire's *Zadig* (1905); and Racine's *Phèdre* (1910). In 1930 he was elected a member of the American Academy of Arts and Letters.

BADEN, bá'den. A component state of the German Republic, formerly a grand duchy in the German Empire, which was proclaimed a republic on Nov. 22, 1918, and continued as such until the spring of 1933 when Chancellor Hitler appointed a Commissary of Police in place of the regular republican officials. It occupies the southwest corner of Germany and is bounded on the west by France, and south by Switzerland; area, 5819 square miles; population, 2,429,977 (1933). In 1931 there were 40,687 births, 24,448 deaths, and 17,370 marriages. Capital, Karlsruhe, with 145,694 inhabitants in 1925; Mannheim, the largest city, had 247,486; and Freiburg, 90,475. The majority of the population is Roman Catholic; religious instruction is provided by the various denominations. Education is compulsory and under the authority of the state. For higher education there are two universities—Heidelberg and Freiburg.

The area under cultivation in 1932 totaled 2,063,710 acres. Among the agricultural crops are oats, barley, wheat, rye, vines, and vegetables. Area devoted to tobacco in 1932 amounted to 13,022 acres; and wheat production in the same year equaled 427,076 metric tons. There are numerous manufacturing industries; mineral products are salt, potash, and building stone. Reich Commissary of Police in Bavaria, Robert Wagner (Nazi), appointed Mar. 10, 1933.

BAHÁ'Í FAITH. A religious movement whose great principle is the oneness of mankind through the abolition of racial, patriotic, class, political, and religious prejudices, founded in Persia in 1844 by Mirza Ali Muhammed, known as the Báb (the Gate or Forerunner of the Cause), and promulgated over a period of 40 years by Bahá'u'lláh (the Author of the Cause). The head of the movement since 1921 has been Shoghi Ef-

fendî (the Guardian of the Cause), grandson of Abdu'l-Bahá (the True Exemplar and Interpreter of the Cause) and great-grandson of Bahá'u'lláh.

The administrative order of the Faith, which has no professional clergy, consists of an annually elected local spiritual assembly of nine members and a national spiritual assembly of nine members, elected at a national convention by delegates from the local communities. In 1933 there existed in some 80 cities of the United States, Canada, and the Hawaiian Islands 56 local assemblies and 24 groups. Throughout the world there were in the same year nine national spiritual assemblies and approximately 400 local assemblies and groups. The national spiritual assemblies will in future elect an international assembly, the chairman of which will be the Guardian.

The twenty-fifth annual convention of the Bahá'í Faith in the United States and Canada was held in Foundation Hall of the Bahá'í House of Worship at Wilmette, Ill., June 1-4, 1933. The principal event of the year was the completion of the contract for the external decoration of the dome of the House of Worship, the material selected being quartz with a medium of white cement, carrying an intricate design as delicate as lace. Great impetus was given during 1933 to the development of summer schools at Greene Acre, Eliot, Me.; Louhelen Ranch, Davison, Mich.; and Geyserville, Calif., where classes were held under the supervision of Bahá'í teachers. Official publications in the United States are the *Bahá'í News*, the *Bahá'í Magazine*, and the *Bahá'í World* (vol. iv of which, covering the period 1930-32, was issued in 1933). A national office is maintained at Evergreen Cabin, West Englewood, N. J. The world centre is at Haifa, Palestine.

BAHAMAS, bá-há'máz. A British colony consisting of an archipelago of coral islands extending from the east coast of Florida to Haiti. There are 700 islands (20 inhabited) and some 2000 rocks with a total area of 4404 square miles and a total population (1931 census) of 59,808. The estimated total population on Jan. 1, 1933, was 61,812. The population of each of the chief islands at the 1931 census was Abaco, 4233; Andros, 7071; Berry Islands, 222; Bimini, 736; Cat Island, 3959; Fortune Island Group (including Long Cay, Acklin's and Crooked Islands), 3238; Eleuthera and Harbour Island, 7527; Exuma and Cays, 3774; Grand Bahama, 2241; Inagua, 607; Long Island, 4515; Mayaguana, 518; New Providence, 19,756; Ragged Island Group, 424; Rum Cay, 252; San Salvador or Watling, 675. Nassau, the capital on the island of New Providence, had 19,756 inhabitants.

In the colony during 1932 there were 2251 births, 1226 deaths, and 462 marriages. In 1932 government primary schools totaled 55, assisted primary schools totaled 57; the number of enrolled pupils was 11,657. There were 4 schools for secondary education.

Excluding specie, imports for 1932 were valued at £940,063 and exports at £263,886. Spirits and wines, the leading imports, were valued at £290,152; imports of foodstuffs, £240,569. Imports from the United States were valued at £334,501; Great Britain, £228,336; Canada, £221,444. The chief exports of local products were tomatoes, cascarilla bark, lumber, tortoise shell, sponge.

During 1932, 1742 vessels with an aggregate tonnage of 3,263,311 entered and cleared the

ports. During the winter a daily air service between Miami and Nassau was maintained; in the summer a similar service was in operation twice weekly.

In the fiscal year ended Mar. 31, 1932, government revenue amounted to £386,374; government expenditure, £422,706; public debt, £180,000; sinking fund, £38,000. During 1932 the Imperial Preference Act was repealed and a tariff enacted to give to British Empire goods the preferences provided for by the terms of the Ottawa Agreement. The colony is administered by a governor who is assisted by an executive council and a legislative council, each of 9 members, and a representative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-Chief in 1933, Captain B. E. H. Clifford.

BAHRAIN ISLANDS. See under ARABIA.

BALBO, GEN. ITALO. See AERONAUTICS.

BALG, GERHARD HUBERT. An American philologist, died at Mayville, Wis., Sept. 28, 1933. He was born at Efferen, near Cologne, Germany, Nov. 11, 1852, and received his early education at the Cologne Gymnasium. On emigrating to the United States in 1871 he attended the University of Wisconsin, from which he was graduated in 1881. He completed his studies at the Universities of Freiburg and Heidelberg, receiving the Ph.D. degree from the latter in 1883. On his return to the United States he was engaged for many years in private tutoring. He published several valuable philological works, notably *A Comparative Glossary of the Gothic Language, with Especial Reference to English and German* (1887-89); *The First Germanic Bible Translated from the Greek by the Gothic Bishop Wulfila in the Fourth Century, and the Other Remains of the Gothic Language* (1891); and an English edition of Wilhelm Braune's *Gothic Grammar* (1895). Also, he supplied Germanic etymologies for Funk and Wagnall's *Standard Dictionary of the English Language*.

BALL, LEWIS HEISLER. An American physician and Senator, died at Faulkland, Del., Oct. 18, 1933. Born near Stanton, Del., Sept. 21, 1861, he was graduated from Delaware College in 1882 and three years later received the M.D. degree from the University of Pennsylvania. He practiced medicine at Faulkland but on his election as State treasurer of Delaware in 1898 decided to enter politics. During 1901-03 he served as delegate-at-large to the national House of Representatives from Delaware and in 1903 was elected to the United States to fill a vacancy.

Again elected to the Senate for the term 1919-25, Dr. Ball was a staunch opponent to the entry of the United States into the League of Nations. In 1921 he served on the subcommittee which investigated the charges of Rear Admiral William S. Sims of grave errors on the part of the Navy Department in the management of United States naval operations during the World War. On the expiration of his term in 1925 he conducted a national survey of the facilities of the Veterans' Bureau.

BANK DEPOSITORS' INSURANCE CORPORATION. See *BANKS AND BANKING*.

BANKERS' ASSOCIATION, THE AMERICAN. The dominant national organization of banks in the United States, having a membership of about 12,000 banks out of a total of 15,000. Its four major divisions are devoted to the special interests, technical advancement, and general welfare of the following classes of banks: National, savings, State, and trust company. There are also two sections devoted to general banking interests, the American Institute of Banking section and the State secretaries section. The former, which is the educational arm of the organization, has an enrollment of 36,000 students from banks in all parts of the country and a general membership of 65,000; the latter forms a link between the national organization and the 48 State bankers' associations.

The association's protective department prosecutes continually a nation-wide campaign of prevention, protection, and investigation for all member banks in respect to criminal operations. It has also a legal department which keeps bankers informed on developments in the field of banking law, while its State and Federal legislative committees and councils attempt to safeguard the interests of banking institutions and the public in both State and Federal banking legislation.

Through its economic policy commission the association conducted during the year studies of insurance and guaranty of bank deposits, branch banking, causes of bank failures, proposed remedial legislation, maintenance of the dual banking system under State and national charters, reconstruction finance proposals, and basic changes in bank credit conditions and methods. Its public education commission conducted lectures on banking in public and private schools and before civic clubs throughout the United States, and its bank management commission developed active studies and methods for more scientific bank management.

Pursuant to the National Industrial Recovery Act, the association in, August, 1933, formulated the Bankers' NRA Code of Fair Competition and organized a banking code committee to carry it into effect in every city, town, and country district. This action enabled the association to put into more active operation its experience and equipment regarding sound methods for co-operation, aimed to strengthen local banking conditions, which it had urged for many years.

The association held its 1933 convention in Chicago, Ill., September 4-7, the chief topics of discussion being Federal government insurance of bank deposits, government banking, and reconstruction policies, and the banking NRA code. The national officers elected for 1933-34 were: President, F. M. Law, president, First National Bank, Houston, Texas; first vice-president, Rudolf S. Hecht, chairman of the board, Hibernia National Bank, New Orleans, La.; second vice-president, Robert V. Fleming, president, Riggs National Bank, Washington, D. C.; treasurer, Hal Y. Lemon, vice-president, National Bank of Detroit, Detroit, Mich. National headquarters are at 22 East Fortieth Street, New York City; Fred N. Shepherd, executive manager.

BANK FOR INTERNATIONAL SETTLEMENTS. See *INTERNATIONAL BANKING*; *BANKS AND BANKING*.

BANK HOLIDAY. See *BANKS AND BANKING*; *UNITED STATES* under *Administration*.

BANKS AND BANKING. For a good many months prior to the advent of the National Administration which came into office at Washington in March, 1933, there had been the gravest anxiety regarding the future of American banking. Continuous bank failures, reaching a peak of about 2300, in 1931, had been somewhat reduced in number during 1932, but the total was still abnormally large; while general conditions suggested the probability of a widespread breakdown. It had been hoped that remedial legislation then pending in Congress might be adopted, in time to afford some relief, but as the short session which opened in December, 1932, drew toward a close, this hope gradually dwindled and collapse was seen to be inevitable. About the beginning of February, 1933, groups of banks in various parts of the country began to suspend specie payments, and about the middle of that month, so-called "bank holidays" were established in numerous localities. Such holidays rapidly spread throughout the country; and on the third of March, had practically isolated New York and a few other places on the Eastern seaboard. The question whether to extend the holiday to these cities was acute, but finally resulted in a disposition to suspend payments. President Roosevelt, after taking office, ratified the holiday by making it national in scope, and a general suspension ensued for some 10 days.

The reopening of the banks was effected during the latter part of March, resumption of payments being ordered in three general groups of banks, opening on successive days, but Congress, which had legislated on the subject meanwhile, provided that there should be no further gold payments, so that the Federal Reserve banks, through whom redemptions had been effected, remained in a state of suspension, making payments only in paper. The Act of Congress (March 10) authorizing the suspension moreover introduced many innovations into banking methods, so that in effect the entire system of eligibility of commercial paper for rediscount (which had underlain the basic banking system of the United States) was abandoned or so marred as to be unrecognizable. The reopening of the banks, moreover, left behind it a total of probably 4500 banks, or thereabout, which were so unsatisfactory in condition that they were either placed in the hands of so-called "Conservators" (a new name for what amounted to receivers), or were opened on a basis of restricted payment. At the end of August official count showed that of these banks, some 2800 remained closed, despite all effort to reopen them. During the latter part of the year, plans for the liquidation of the assets of these closed banks were adopted, and the assets of a considerable number were distributed or the banks were recapitalized and reopened. The number of banks in active operation at the beginning of 1933 was probably somewhat under 18,000, while at the close of the year this number had been reduced to about 13,500. Meantime, moreover, Congress had, on June 16, adopted the so-called "Glass bill" or Banking Act of 1933, as it was denominated in the statute creating it, and under its terms, many extensive changes in banking legislation had been introduced. Of

these, the most striking was the provision for a general guaranty of bank deposits, through an organization later known as the Federal Deposit Insurance Corporation. This concern was estimated to have at its beginning control over funds totaling perhaps \$450,000,000, with authority to obtain additional capital, through the issue of debentures. The guaranty provision was not, at first, included in the "Glass bill," but had been added as a result of the constant agitation which, for years, had demanded a step of the sort, and now culminated in an extreme proposal to which many of the participants in the framing of the measure only reluctantly acceded. Congress, too, had, during the spring, given up the gold standard, and had in the so-called "Inflation Act" (May 12) authorized the President, in his discretion, to print and issue three billions of legal tender notes, or to issue silver on a legal-tender basis, at a fixed ratio to gold, or to reduce the gold content of the dollar, or to resort to all of these measures when, as, and if, he felt disposed.

By an Act adopted June 5 Congress had revoked or nullified the gold clause in all contracts, cancelled the gold contractual obligation in Government bonds, and forbidden the future making of contracts in gold, while the Treasury, under the authority vested in the President, had instituted a strict control of foreign exchange, and had sought to restrain movements of gold, and of other funds, to foreign countries. Inasmuch as the hoarding or holding of gold had been made a criminal offense, and owners had generally been compelled to surrender such gold as they possessed, the nation had "gone off gold" with a thoroughness practically unexampled in monetary history. In these circumstances, the banks in general found themselves confronted by difficulties of an unprecedented sort, and continued throughout the year in a crippled condition largely aggravated by the various measures, and the immense expenditures, which appeared to be integral elements in the so-called "programme of recovery."

NATIONAL BANKS. The National system, as usual, constituted the nucleus upon which Congressional legislation was expected to take effect, and by whose use as a gathering point, it was expected to install the different devices which had been thought of by the politicians in the endeavor to rectify the financial situation. Investigation, at the time of the bank holiday, did not encourage the thought that the National banking system was materially better off, if at all, than was the case with the various State banking organizations. Subsequent attempts to better the conditions were more or less successful according to the condition of the banks upon which they were tried, but there was at no time definite indication that National supervision had been successful in bringing about a stronger or better state of affairs among the National than among the State, institutions. As the year progressed, it was apparently out of the question to restore the National banks to a position in which the writing down of their assets to an extent that would permit an accurate balance-sheet statement was possible, and accordingly considerable distrust continued to prevail on the part of depositors. In not a few cases, National banks, after being technically reopened, found it needful to close, as did not a few of the State banks, while the management of the Federal Deposit Insurance

Corporation thought it needful to inform inquirers that, although Congress had provided that no bank should be eligible for the guaranty unless it had unquestioned assets sufficient to meet demands of its depositors, and other creditors, this was not to be interpreted as signifying that its stockholders were to be included in the latter category;—notwithstanding that, in the past, the possession of an "unimpaired" capital had always been regarded as an indispensable pre-requisite for continuance in the "banking business." Extreme reticence characterized official outgivings regarding the banking situation, and it was deemed desirable by the Federal Reserve Board to suspend publication of the regular reports on bank failures, previously made public each month, while in the latter part of the year, the usual monthly discussion of banking and business conditions was suspended, as a concession to the wishes of the Administration. The National system, statistically viewed, suffered terribly from the bank holiday and failure situation, its membership falling by about 850 or 18 per cent while total loans and investments were off, at the middle of the year, by about \$2,000,000,000, the total being then \$15,460,079,000. Only 5152 active institutions remained on Jan. 1, 1934, and they had but \$17,115,367,000 of deposits, against a total a year earlier of \$18,301,916,000. These changes were the result not only of the immediate conditions of the year, but were in part the outcome of the long-concealed and gradually deteriorating condition of the banks growing out of bad management, lax supervision, and erroneous Governmental policies.

LEGISLATION AND DISCUSSION. Reference has already been briefly made to the remarkable volume of fundamental legislation on banking and monetary topics which reached the statute books during the year 1933. Further analysis of its major banking provisions is now necessary. The Glass bill, which became law on June 16, 1933, was originally intended to strengthen the provisions of the National and Federal Reserve Acts, at points where weakness had been demonstrated in the course of the collapse of 1929, and the financial troubles consequent upon that year. It had been bitterly attacked as a needless, trouble-making, bill likely to cause banking disaster. The Banking Committee of the Senate had replied to these assertions by instituting an inquiry into actual banking and financial transactions, centering around some of the main personalities in the banking community and these came to a head early in 1933, with revelations of irregularity, and betrayal of stockholders' interests, that caused a strong revulsion of feeling throughout the country. In such circumstances, the "Glass bill," when introduced in the new Congress after the exodus of many legislators repudiated by their constituents at the autumn election of 1931, found ready reception; indeed, receiving far less than the amount of legislative study which it should ordinarily have elicited. As finally adopted, it prohibited the further practice of investment banking, securities issue, and similar operations along with deposit banking, and ordered complete separation between the two types of business.

In addition, it decreed the surrender of the so-called "affiliates" (corporations jointly owned with National banks for the purpose of permitting securities transactions otherwise not permitted under the banking law) within a year

from date of passage. It further forbade the payment of interest on demand deposits and gave to the Reserve Board the power to regulate interest on time deposits. It further prohibited joint service of bank directors upon boards of banks and (simultaneously) those of other financial corporations. Lending of money to brokers (the so-called "loans on behalf of others," which had been found the cause of so much difficulty in 1928-29) were prohibited for the future, while the Reserve Board was authorized to fix the amount of credit to be extended by banks on collateral security. As for the Reserve banks they were forbidden to lend on collateral to members, if the latter were increasing their market loans at the same time provided that such banks were, first of all, given due warning. A new constitution for the body which controlled open market operations was provided, and Reserve banks were directed to report to the Board their relations with foreign central institutions, in every case. The act by which this far-reaching measure was preceded (Act of March 10) had already permitted the rediscounting of practically any assets that banks might have, in cases of emergency wherever was required. It had thus still further modified the principles underlying the Federal Reserve Act already so gravely infringed by the legislation of 1932, adopted at the instance of President Hoover, and to which Chairmen Glass and Steagall had both assented.

When it is recalled that, beside these dras-

tic provisions, the new law called for a general guaranty of deposits it is easily realized that 1933 must be reckoned the most important year in American banking legislation since 1913. Other banking measures of an allied sort demanded by the new Administration, and adopted by Congress included home owners mortgage relief, through special institutions, and farm mortgage relief through a new organization termed the Agricultural Adjustment Administration, and numerous less important provisions. The immense broadening of the funds and powers of the Reconstruction Finance Corporation placed it in position to act as an intermediary for the government in the performance of functions hitherto unthought of, and established what was thought by many as a hazardous engine of emergency finance. The banking system did not respond in any satisfactory way to these acts of legislation. Constant complaint was heard that banks were refusing credit, and pressure of more or less effective sort was applied to them in the endeavor to induce the extension of loans to concerns and individuals requiring support for the purpose of compliance with the demands of the new recovery Administration. The banks tended to assume a cowed condition reluctant to make new commitments, and feeling themselves constantly under attack—an attitude greatly intensified by the Congressional investigations and revelations to which reference has already been made. Loans tended gradually to shrink, and as the year ad-

vanced, business men were less and less disposed to borrow, feeling doubt regarding their ability to repay.

The constant cry for more currency which is frequently heard on such occasions, was again raised, and served as an excuse for the efforts of the Administration to stimulate both member and Reserve banks to afford to customers larger supplies both of credit and of paper currency. There was a strong tendency to press upon the banks the necessity or duty of making "free loans," in order to facilitate the return of prosperity, and much effort to emphasize the disposition of the Government to assist the making of such loans by advances of long-term funds from the Reconstruction Finance Corporation, or through easy and cheap rediscounting at Reserve banks. As the year advanced, and as it became evident that the various institutions could not expect to restore their balance sheet situation to a condition of soundness, the Administration brought forward a proposal, which had been authorized in the relief Act of March 10, that the several banks issue "preferred stock." Although

various groups of banks, and all were shortly overwhelmed in the suspension movement.

During the discussion of the guaranty system, many State banks feared that they would be subjected to unfair competition, but Congress provided for the admission of all, even including the mutual savings banks. Many of the latter and others, later doubted the wisdom of accepting participation in the guaranty fund, and on Dec. 31, 1933, over 55 per cent of savings banks had failed to insure, legal authorities in some States held that such participation would be *ultra vires*—beyond lawful powers. The confusion and hysterical fears on the part of some State bankers had led to an unusual ingress of banks into the Reserve system, although not a few were inclined to express doubts as to the wisdom of their course as soon as admitted. It was a time of utmost confusion and question of all banking conditions. The changes in balance-sheet items undergone by these banks and trust companies, were not greatly different from those observed in the case of the National institutions. They may be surveyed generally in the accompanying table.

this proposal had originally contemplated such issue to new stockholders who would be induced to buy it by the grant of freedom from double liability, the Government, at the end of August, offered to purchase the stock itself out of Treasury funds either with or without proportionate contribution on the part of the public. Few subscribers offering, the banks, in some cases, were prone to ask the Reconstruction Finance Corporation to buy the stock, and at the close of 1933 over 3000 banks were reported to have received such aid, while the Reconstruction Finance Corporation was the proprietor of upward of \$900,000,000 of bank stock—assuming at the same time to name Government directors where the management was unsatisfactory.

STATE BANKS AND TRUST COMPANIES. Conditions among the State banks and trust companies were not far different from those existing among the member banks. It was the authorities of the several States that had started the bank holiday fashion, and had set the bad example of adopting laws during February and early March authorizing banks to continue in operation even though they might not be able to meet the payments to demand depositors, by getting the permission of State bank superintendents who were expressly permitted to grant such permission when needed. Even in New York such a statute had been hastily adopted and New Jersey had gone further, by authorizing her institutions to suspend payment yet keep open without the need of reference to the State Banking Department. The provisions of a similar sort in other States were numerous, though varying considerably in detail. The coming of the bank holiday, however, revealed little difference between the

FEDERAL RESERVE BANKS. With the advent of the bank holiday and the suspension of specie redemptions by the Reserve banks, it was the opinion of many that the development of the Reserve institutions would witness a gradual, perhaps rapid, expansion, and that the inflation demands of the nation would force the creation of a vast amount of fiat credit. The fact turned out differently from expectation, for it shortly appeared that the business public did not want more credit, while the rank and file of the people who had been hoarding money and currency, were willing, with the return of confidence, to redeposit it. The end of the year, accordingly, found the nation with a smaller volume of currency outstanding than at the beginning. Federal Reserve credit as computed by the Reserve Board, was but little increased, and loans of member banks, both on collateral and on commercial paper, were materially lessened. If by "inflation" was meant an increase of currency and credit the year's results were actually deflationary,—and in a high degree. The Reserve banks, moreover, sank ever deeper in the morass of Government credit, steadily absorbing more and more Government paper as the deficit expanded, while their balance sheets, when combined with those of the member banks, clearly revealed that the entire deficit of the nation was being dumped into the portfolios of the various institutions, under the guise of Treasury bills, and short-term notes, with some further purchases of long-term bonds in open market. Discount policies had ceased to play any important part, with the great changes in credit and banking conditions already introduced. The accompanying statement shows the change in the condition of Member banks as re-

flected in the weekly report of selected members in 90 principal cities.

WEEKLY STATEMENT OF REPORTING MEMBER BANKS. [Amounts given in millions of dollars]

+ Increase. — Decrease.

Reserve discount policy during the year, in fact consisted entirely of an attempt to give the impression of ease of money—an effort hardly successful in view of the actual difficulty of borrowing even at high rates. The nominal rate of discount at the Reserve banks, however, was cut during the year to 2½ per cent in New York and at other banks generally, to 3 per cent. Open market purchases of Government bonds, which had been so prodigally made during 1932, were renewed, though on a smaller scale, during the summer and early autumn, but were later abandoned, as the Reserve banks began to assume a definitely "frozen" condition. One of the outstanding activities of the Reserve system for the year was the further amassing of a larger gold hoard. The adoption by Congress of laws making the holding of gold a crime led to the further concentration of the metal in the reserve institutions, with a net gain of some \$300,000,000 though the total stock of the nation remained practically unchanged. In order to hold these gains of gold, the Reserve system was authorized by the President to install a stringent system of foreign exchange control, designed to prevent transfers of private capital abroad. This, at once, sent the dollar to a discount in foreign exchange; and, when the President at the beginning of November announced the adoption of a plan of his own for the making of a gold market, whereby a fixed Government price was every day named, the reduction of the foreign value of the dollar was rapid. During the latter portion of the year, the functions of the Reserve system became little more than those of discounting and lending to the government, and assisting in this manipulation of exchange quotations, with a view to forcing the current value of the dollar to still lower levels. In this connection mention ought to be made of the London Conference on economic and financial questions which, although not shared in by the Reserve banks, nevertheless was expected to deal extensively with the problem of reserve credit. Although President Roosevelt himself had during the spring months foreshadowed much attention to central bank questions at London, a change of policy announced on July 4, in an unexpected message sent by him to the delegates of the United States at the conference practically nullified their efforts, and repudiated what they

had done. The conference was followed by a visit on the part of the Governor of the Bank of England for the purpose of discussing monetary stabilization and central bank policy, but this attempt proved ineffectual and the mission came to nothing. The Reserve banks were more and more isolated from other central banks, as the latter came more and more to regard the policy of the United States in relation to gold as inimical to the best interests of the other central institutions. As the commercial business of the Reserve banks declined, and as their function became more and more exclusively that of financing the needs of the Government, their prestige sank at home, while abroad, for reasons already set forth, they were never so low in standing as was the case during the latter part of the year. The President, however, having given his consent, a representative of the Reserve system became a member of the directorate of the Bank of International Settlements, a relationship previously forbidden by President Hoover. The accompanying table presents the changes in conditions of the Reserve banks during 1933. See next page.

BANK CREDIT. The growth of bank credit during the year was, as already noted, a subject of constant anxiety. Not only was it felt at the outset, that there was a "shortage of credit," but after the occurrences were over, it was easy to realize that what had been done in Washington regarding the closing of the banks had "tied up" a vast body of credit previously in a semi-frozen condition and now actually out of reach for an indefinite period. Despite the efforts to "release" some of this credit, there continued to be a decline during the year, and deposits of Member banks sank from about \$24,803,000,000 at the opening of the year, to about \$23,358,000,000 at the end of the fiscal year. Federal Reserve credit as computed in totals by the Reserve Board was more constant, being \$2,110,000,000 at the opening, and \$2,530,000,000 at the end of October. Still it remained further true that, in some parts of the country where bank closings had been numerous, the local supply of bank credit was almost entirely cut away. As a result, the quantity of notes out, although shrinking during the twelvemonth, did not contract to the extent that had been expected, owing to the fact that the notes took the place of the deposit credits that had been suspended or eliminated as already explained. It was notable, too, that due to the enlargement of speculative interest and activity there was a recovery of the advances of member banks based upon security. These loans at reporting member banks decreased only from a total figure of \$3,600,000,000 at the beginning of January to \$3,500,000,000 at the opening of December. At the same time brokers' loans moved as shown in the accompanying table.

BROKERS' LOANS, 1933

January 30	\$359,000,000	July 30	\$916,000,000
February 28	860,000,000	August 31	917,000,000
March 31	811,000,000	September 30	897,000,000

weeks of the bank holiday to be troublesome, notwithstanding that, in closing the banks, it had been announced that none would be allowed to reopen that were not sound. The confusion between banks caused by the grant in various States of permission to operate on a restricted basis, led to considerable doubt whether at any given time, a bank had in fact failed, and accordingly, the National authorities ceased to publish comparative statistics upon the same basis as in the past. An unsatisfactory statistical basis therefore was established; and it was not possible to trace the movement of failures by months as previously. The Comptroller's annual report (moved forward from the early part of December to the early part of January as a result of the constitutional change shifting the opening of Congress to January, afforded some figures that help to clarify the situation but the returns are likely to continue unsatisfactory for a good while. What can be said with assurance is that during the year there was a decrease in the number of banks open for

business by about 1900 the number at the end of the year 1932 being probably about 18,390 while of the latter figures about 6011 were National and the remainder State institutions including trust companies. At the end of 1933 the number was 16,212 of which 5619 were National. The failure situation continued to give anxiety since investigation had shown that many banks were seriously impaired and in any ordinary circumstance would have been placed in the hands of receivers. This situation may be expected to show itself definitely in the statistics of the coming year. Bank suspensions so far as data are available are set forth in table on page 84.

INTERNATIONAL RELATIONS. The subject of INTERNATIONAL BANKING (q.v.) has been dealt with in a special article, but at this point it is desirable to mention some of the international workings of the domestic banking situation. Of these, the most immediately significant was naturally the gradual cutting off of the United States from its position as the market in which inter-

BANK SUSPENSIONS

national balances were placed or held. Ever since the close of the World War, there had been a tendency to send foreign balances both of central and private banks to the New York market. Secretary Mellon, in 1927, had estimated that total so held as high as two billions of dollars, and they probably reached an even larger total subsequent to that year. France's withdrawal of her funds in 1931 and 1932 constituted an important breach in this situation, and such withdrawal was followed by like action on the part of Switzerland and Holland, as well as of other countries, which were in a less liquid condition. When the United States "went off the gold standard," provision was made for the full payment of earmarked holdings in favor of foreign banks, and those balances not so earmarked were withdrawn as rapidly as conditions of foreign exchange control would permit, or were checked out in payment of indebtedness to American creditors while Americans also began leaving their funds abroad and transferring others as steadily to other markets as conditions would allow. Thus during the year, transfers roughly reckoned (semi-officially) at from one to two billions of dollars were shifted to London, Paris, and other centres. The New York market simply lost its commanding position as a money centre.

At the same time, due to the adoption of the so-called "Securities Act" which practically rendered impossible the successful flotation of new issues, or at least was so regarded, the offering of foreign issues came to be considered out of the question, and this type of business was shifted to London. Thus the unprecedented and profitable position of the New York banks occupied without intermission for nearly two decades, was lost, and they returned to their older position as a purely local market. The use of the dollar as a medium in which to draw bills for the financing of foreign trade was generally discontinued, owing to the uncertainty and fluctuating value of the dollar in current exchange operations. Some American banks definitely closed sundry of their foreign branches, and others reduced the activity of such branch institutions. Foreign banks with branches in the United States, likewise cut their commitments in New York, and reduced the scope of their transactions as far as possible. The decline of American export trade, which necessarily followed upon the monetary policy of the Roosevelt Administration effectively eliminated most of the foreign trade financing on short-term, which had previously been so im-

portant a factor in banking business at a number of the centres. See UNITED STATES under *Foreign Trade*.

BAPTISTS. In 1933 there were in the United States 14 groups comprised in the denomination known as Baptist, which maintains that baptism should be administered to believers only and generally by immersion. For the early history of the Baptists see THE NEW INTERNATIONAL ENCYCLOPEDIA, vol. 2, p. 646 ff. and THE NEW INTERNATIONAL YEAR BOOK for 1932.

NORTHERN BAPTIST CONVENTION. According to the *Annual of the Northern Baptist Convention*, 1933, this denomination was composed of 36 conventions in 33 States, the District of Columbia, and Puerto Rico; and reported 417 local associations, 7880 churches, nearly 9000 ordained ministers, 64,706 baptisms during the year, 1,489,836 members, 7155 Sunday schools, and 1,159,029 Sunday school pupils. Church property was valued at \$218,730,420, while contributions for current expenses amounted to \$17,130,357, and for beneficence to \$4,062,246.

The twenty-sixth annual meeting of the Northern Baptist Convention was held in Washington, D. C., May 23-28, 1933, the general theme being "The Challenging Christ." The Keynote address was delivered by Dr. C. Oscar Johnson, pastor of the Third Baptist Church of St. Louis, Mo. The officers elected for 1933-1934 were: president, William S. Abernethy, D.D., Washington, D. C.; first vice president, Pres. William G. Spencer, Franklin, Ind.; second vice president, Clarence W. Kemper, D.D., Charleston, W. Va.; corresponding secretary, Maurice A. Levy, D.D., Williamsport, Pa.; recording secretary, Clarence M. Gallup, D.D., Providence, R. I.; and treasurer, Orrin R. Judd, New York, N. Y. The next annual meeting was set for Rochester, N. Y., May 23-28, 1934.

In 1933 the Northern Baptist Convention maintained 55 educational institutions, including 10 theological seminaries, 6 training schools, 19 colleges, 7 junior colleges, and 13 academies. These institutions had 30,153 students, 2570 instructors, 573 buildings, property aggregating \$109,818,534 in value, endowments valued at \$150,684,305, and an annual income for the year of \$18,500,142. The leading denominational papers in 1933 were: *Baptist Banner* (Parkersburg, W. Va.); *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Iowa); *Baptist World* (Malden, Mass.); and *Watchman-Examiner* (New York City). In addition, most of the State

conventions issued monthly bulletins, and the various foreign-speaking bodies in the United States published their own periodicals.

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, with 681 missionaries. In 1933, churches numbered 3112 with 328,128 members; native workers, 10,514, Bible schools, 2910 with an enrollment of 127,694 pupils; and hospitals and dispensaries, 91, with a total of 22,949 inpatients and 313,248 out-patients. The field of the home mission societies included in addition to the United States and its dependencies, Mexico, the West Indies, Central America, the Canal Zone, and South America. Their greatest activity was among the Negroes, Indians, and new Americans. The denomination maintained also six hospitals, the largest being the New England Baptist Hospital in Boston and the Northwestern Baptist Hospital in St. Paul, 23 homes for the aged, and 13 children's homes.

General headquarters of the denominational organizations are at 152 Madison Avenue, New York City, with the exception of the Home Mission Society, which is at 23 East Twenty-sixth Street, New York City, and the American Baptist Publication Society, which is at 1701 Chestnut Street, Philadelphia, Pa. The unified missionary interests of the denomination are administered by the Board of Missionary Cooperation; and the principal convention affairs are conducted by the executive and finance committees, together with some 20 other committees. Two other major boards of the denomination are the Board of Education, which cares for the work and property of the denominational schools and colleges, with assets of approximately \$260,000,000, and the Ministers and Missionaries Benefit Board, which cares for the pension and emergency aid work for ministers, missionaries, and their dependents, with assets of nearly \$20,000,000.

SOUTHERN BAPTIST CONVENTION. According to the official *Handbook* for 1933 there were reported 18 State conventions, 24,035 churches, 22,801 ordained ministers, 226,855 baptisms during the year, 4,066,140 church members, 21,531 Sunday schools, 3,051,469 Sunday school pupils, and 29,203 Baptist Young People's Unions with a membership of 583,842. Contributions totaled \$27,341,488; church property was valued at \$209,719,089. Receipts of the boards of the convention in 1933 were as follows: Southern Baptist Foreign Mission Board (Richmond, Va.), \$792,829; Southern Baptist Home Mission Board (Atlanta, Ga.), \$396,462; Sunday School Board of the Southern Baptist Convention (Nashville, Tenn.), \$1,517,613; and Old Ministers Relief and Annuity Board (Dallas, Tex.), \$210,980.

The denomination maintained 72 schools and colleges, including five theological schools, 29 senior colleges, 21 junior colleges, and 17 academies, with a total enrollment of 25,101 students, 1638 ministerial students, and 1455 instructors. The educational endowment amounted to \$22,088,898, and property was valued at \$37,773,244. It reported also 28 hospitals (two fostered by the Southern Baptist Convention and 26 by the State conventions), valued at \$14,712,157 and accommodating 80,189 patients during the year; 19 children's homes with property value of \$5,979,731 and accommodating 4,729 children; and three homes for the aged.

The annual session of the Southern Baptist Convention was held in Washington, D. C., May 19-22, 1933. The various boards and agencies of the convention showed still further declines in receipts for the year, bringing about a critical situation. To meet this situation the Baptist 100,000 Club was organized and still further emphasis was given to the work of the Promotion Committee of Southern Baptists, uniting it with the executive committee with headquarters at Nashville, Tenn. The committee sponsored an "Every-Member Canvass" during the week of Nov. 26-Dec. 3, 1933, with the objective of securing weekly subscriptions for \$40,000,000, of which amount \$9,000,000 was to go to the support of the various missionary, educational, and benevolent enterprises of the convention, while the remainder was to care for the local work of the churches.

The following officers for the Southern Baptist Convention were elected: M. E. Dodd, D.D., of Shreveport, La., president; the Hon. Pat M. Neff, of Waco, Tex., and Chas. W. Daniel, D.D., of Richmond, Va., vice-presidents; Hight C. Moore, D.D., Litt.D., of Nashville, Tenn., and the Rev. J. Henry Burnett of Macon, Ga., recording secretaries; and Austin Crouch, D.D., 161-8th Avenue, North, Nashville, Tenn., executive secretary.

NATIONAL BAPTIST CONVENTION OF AMERICA (NEGRO). For the fiscal year ending Aug. 30, 1933, the National Baptist Convention of America reported 1341 associations, with 54 conventions affiliated with it through messengers and delegates represented in person or by letter at the 1932 convention. There were 21,542 ordained ministers and a membership or constituency of 3,591,412, showing an increase of 9100 over the previous year, by baptism and Christian experience. The organized Sunday schools had increased to 21,202, with an enrollment of 1,821,261 pupils. Contributions from all sources amounted to \$5,421,632. The next session of the Convention was to be held in Muskogee, Okla., in September, 1934. The president in 1933 was G. L. Prince, D.D., of Denver, Colo.; the secretary was C. P. Madison, D.D., of Norfolk, Va. Denominational headquarters are at the National Baptist Publishing Board, 523 Second Avenue North, Nashville, Tenn.

BAR ASSOCIATION, AMERICAN. A national organization, founded in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members.

The association's fifty-sixth annual meeting was held in Grand Rapids, Mich., Aug. 30-Sept. 1, 1933. Clarence E. Martin, the retiring president, spoke at the opening session on "The Growing Impotency of the States." The other notable addresses were by Judge John J. Parker of the United States Circuit Court of Appeals for the Fourth Circuit, on "Is the Constitution Passing?"; Leonidas Pitamic, Minister to the United States from Yugoslavia, on "Some Aspects of the Problem of Interpretation"; Senator Patrick A. McCarran of Nevada, on "The Growth of Federal Executive Power"; Homer S. Cummings, Attorney-General of the United States, on "Modern Tendencies and the Law"; and Judge Martin T. Manton of the United States Circuit Court of Appeals for the Second Circuit, on "A 'New Deal' for Lawyers."

Preceding the annual meeting, on August 28-

29, there were held sessions of the following sections of the association: Criminal law and criminology; insurance law; international and comparative law; judicial; legal education and admissions to the bar; mineral law; patent, trade-mark, and copyright law; and public utility law. The Commissioners on Uniform State Laws, the Conference of Bar Examiners, the National Association of Attorneys-General, and the National Association of Legal Aid Organizations met also on this occasion. The Conference of Bar Association Officers formulated a programme to bring closer together the 1250 State and local bar associations in the United States, combining their working energy under the leadership of the national organization.

The membership of the association in 1933 was approximately 28,000. Its official organ is the *American Bar Association Journal*. Earle W. Evans of Wichita, Kan., was elected president for 1933-34; John H. Voorhees of Sioux Falls, S. D., was reelected treasurer and William P. MacCracken, Jr., of Washington, D. C., secretary. Headquarters of the association are at 1140 North Dearborn Street, Chicago, Ill. See LAW; CRIME.

BARBADOS, bār-dā'dōz. An island colony in the West Indies, east of the Windward Islands, with an area of 166 square miles and a population (Jan. 1, 1933 estimate) of 176,874; Bridgetown, the capital, had 13,486 inhabitants; Speightstown, 1500. In 1932 births numbered 5391, and death 3325. Education is under the authority of the government. In 139 primary and secondary schools 25,103 students were enrolled in 1932.

The chief product is sugar of which 102,309 long tons were produced in 1932 (115,000 long tons estimated for 1933). Rum production in 1932 was 241,309 gallons. In 1932-33, imports were valued at £1,656,876; exports, £1,379,006; revenue, £457,853; expenditure, £425,875; public debt £649,000 for which the sinking fund was £370,671. There were 1089 ships aggregating 2,069,255 net tons entered during 1932.

A governor administers the affairs of the island with the assistance of an executive council, an executive committee, a legislative council of 9 members appointed by the King, and an assembly of 24 members elected annually by the people. Governor, M. A. Young who assumed office in August, 1933, succeeding Henry S. Newlands who died on Mar. 12, 1933.

BARLEY. The 1933 barley production of 38 countries as reported to the International Institute of Agriculture amounted to 1,255,192,000 bu. or 80,049,000 bu. less than the production in 1932. The 1933 crop of Canada, estimated at 63,737,000 bu., was over 20 per cent below the 1932 crop of 80,773,000 bu. Argentina in the crop year 1933-34 produced 35,367,000 bu., an increase of 1 per cent over the preceding crop.

The barley crop of the United States in 1933, according to estimates published by the Department of Agriculture, amounted to 156,104,000 bu. which was 48 per cent less than the crop of 302,042,000 bu. harvested in 1932 and the smallest crop produced since 1922. The acreage harvested in 1933 was 10,052,000 acres as compared with 13,346,000 acres harvested in the preceding year. The average yield, estimated at 15.5 bushels per acre, was 7.1 bu. under the average yield in 1932 and 7.3 bu. under the ten-year average for 1921-1930 and was the smallest yield per acre

on record. The average yield per acre was only 68 per cent of the ten-year average and the total crop only 59.2 per cent of the average for the five years 1926-1930. The average farm price of barley on December 1, 40.7 cents per bushel, brought the farm value of the crop to \$63,486,000, or \$2,797,000 above the value of the much larger crop in 1932 when the corresponding price per bushel was only 20.1 cents. The leading barley producing States and their yields were reported as follows: Minnesota 28,675,000 bu., California 24,471,000 bu., North Dakota 18,300,000 bu., and Wisconsin 17,710,000 bu. These States produced 57 per cent of the country's crop as reported by 35 barley growing States. The United States, during the fiscal year ended June 30, 1933 exported 9,155,000 bu. of barley and 268,000 bu. of malt.

The resumption of the manufacture of beer in 1933 developed an interest in the production of malting barley and a possible premium price for the product. In this connection the Department of Agriculture pointed out that malting barleys can be grown profitably in certain favored localities in western New York and in parts of the northern Mississippi Valley and that out of the barley crop of 211,000,000 bu. in 1917 only about 72,000,000 bu. was used for malt. An investigation conducted at the University of Wisconsin showed that growth under conditions of adequately high soil moisture and atmospheric humidity tends to increase the permeability of the seed coat in barley which enhances its malting value.

BARNARD'S SPOT. See ASTRONOMY.

BARRY-DOYLE, THE RT. REV. MGR. RICHARD. A British Roman Catholic churchman, half-brother to Sir Arthur Conan Doyle, died at Leicester, England, Mar. 8, 1933. Born at Airdowns, Co. Wexford, Ireland, in 1878, he attended St. Peter's College, Wexford, and studied for the priesthood at St. John's College, Waterford, being ordained in 1905. While serving as chaplain with the British Forces in Egypt and Palestine during the World War, and with the Army of the Black Sea stationed near Istanbul for three years after the War, there was brought home to him an intimate realization of the misery among the expatriated Christian populations of Greece and Asia Minor. Known as "the Children's Crusader," he devoted his efforts to the establishment of orphanages, schools, a seminary, and other institutions in Athens and to the raising of funds for their support through the Catholic Near East Welfare Association, of which he was founder and first president. In 1926 the work of the association was brought under the immediate control of the Holy See and the American hierarchy but in recognition of the keen interest which he had aroused in it by his lecture tours in England and other countries he was appointed Domestic Prelate to the Vatican Court (1920), Archimandrite of Athens (1926), and Protonotary Apostolic (1928). At the time of his death he was rector of St. Peter's Church, Leicester.

BASEBALL. The New York Giants, spurned and scorned in 1932, furnished surprise after surprise in the 1933 professional baseball campaign, usurping first place in the National League at the outset of the pennant race in April and retaining the hold on the leadership through September. To cap the miracle, as the feat was called by experts who had unanimously picked the Giants to take sixth place for the second successive season. New York's team proceeded

to blast the Washington Senators, American League champions, apart in a five-game World Series. The Giants' feat of rising from the mediocrity of 1932 to the world's championship in one year was remarkable and after it was all over was hailed as such, and the team was lauded as one of the steadiest and most compact in the history of the game.

The Giants were led to their surprising triumph by Bill Terry, youthful manager serving his first full year at the helm. Midway through the 1932 campaign Terry had been named manager to succeed John J. McGraw, retired. In the winter months he bolstered his team by trades, called ineffective at the time, and from the opening game the Giants, a group of young players, beat back the challenges of the more seasoned and favored clubs. In Carl Hubbell, lefthander, the Giants possessed the most effective pitcher in the major leagues. In Gus Mancuso they had one of the steadiest catchers, the man mainly responsible for the brilliant pitching of Hal Schumacher and Roy Parmelee, untired youngsters, and the veteran Fred Fitzsimmons. Terry placed his faith in John (Blondy) Ryan, fresh from Holy Cross College, at shortstop, when Travis Jackson, veteran infielder, was injured and Ryan was the sensation of the league. The Giants fairly spread-eagled the field in the National League and were mathematical certainties to win in the first week in September. The Pittsburgh Pirates were second, the Chicago Cubs, defending champions, third, and the St. Louis Cardinals, fourth, a few points ahead of the strong Boston Braves, who challenged the Giants late in August.

The Washington Senators had an easy time in taking the American League pennant, topping the defending world champions, the New York Yankees, and the Philadelphia Athletics early in June and keeping the lead through the following months. They, too, had their pennant clinched early in September. The terrific batting power of the Senators coupled with expert pitching and the veteran experience in the line-up made them decided favorites to defeat the Giants in the World Series, but Hubbell won two games for New York, Schumacher one, and Adolpho Luque, forty-year-old Cuban, one (the fifth and deciding game). Mel Ott, right fielder, won the first and fifth games with home runs.

Jimmy Foxx, first baseman of the Philadelphia Athletics, was the premier batter of the season, leading the American League in batting and in home runs. Foxx hit forty-eight home runs, leading Babe Ruth, his closest rival, by fourteen. Ruth was pretty much in eclipse in the latter part of the season when his aging legs kept him out of the Yankee line-up. Chuck Klein, outfielder of the Phillies, led the National League in the same departments in which Foxx was supreme in the younger circuit. Klein led the league in batting and pounded out twenty-eight home runs. Carl Hubbell, who early in the summer compiled a record of forty-six scoreless innings, led the National League pitchers, and the American League hurlers were topped again by Bob Grove, of the Philadelphia Athletics.

The financial depression continued to exert its pressure on baseball as on other sports, but there was a decided increase in interest in the game. For the first half of the season the fans stayed away from the Giants' games but as they stayed in first place, the crowds flocked to watch them play. The Giants were money makers at home

and on the road, playing to huge crowds in Boston, in Pittsburgh, and Chicago. The World Series drew well, capacity in Washington for two of the three games there, and near capacity in the Polo Grounds in New York for the pair there. The losing clubs in the leagues suffered and all sorts of schemes were resorted to in an effort to snare the fan. In Brooklyn and St. Louis, particularly, scheduled weekday games were moved ahead to Sundays and holidays making synthetic double-headers, but even these failed to draw the crowds unless a winning team was the opponent.

Buffalo, after finishing fourth in the season play, won the play-off to be crowned International League champion, but lost to Columbus of the American Association in the Little World Series. Los Angeles won the Coast League race, and New Orleans took the honors in the Southern Association. San Antonio had an easy time in the Texas League but was beaten by New Orleans in the Dixie Series. Binghamton won the New York-Pennsylvania League flag.

Columbia University won the Eastern Intercollegiate League title, and Williams retained Little Three honors.

In early December the various league magnates met in Chicago and their meetings resulted in trades of truly momentous proportions and which are sure to affect the 1934 races. Connie Mack, veteran seventy-one-year-old manager of the Philadelphia Athletics, completed the wreckage of his team, pennant winner in 1929, 1930, and 1931, by selling Bob Grove, Rube Walberg, and Max Bishop to the lowly Boston Red Sox, George Earnshaw to the Chicago White Sox, and Mickey Cochrane to the Detroit Tigers. In one day Mack negotiated the biggest deals in years and focused attention upon the Red Sox, being built up by the new owner, Thomas Yawkey. Cochrane was made manager for 1934 of the Detroit Tigers replacing Bucky Harris, who was signed to manage the Red Sox in place of Marty McManus. Chuck Klein, great batting star of the Phillies, was sold to the Chicago Cubs for \$100,000 at the same meeting.

BASEDOW, HERBERT. An Australian anthropologist, died June 4, 1933, in Kent Town, Adelaide, Australia, where he was born Oct. 27, 1881. He attended Prince Alfred College and the University of Adelaide and pursued advanced studies for the M.D. and Ph.D. degrees at the Universities of Heidelberg, Göttingen, Breslau, and Zurich. At the instance of the University of Adelaide he led several exploring expeditions, on which important discoveries were made in Australian geography and natural history, and was attached to the vice-regal expeditions of Sir George Le Hunte, Sir Tom Bridges, and Lord Stradbroke. His public appointments included State and Commonwealth Medical Commissioner on Aborigines, Chief Medical Officer and Chief Protector of Aborigines for the Commonwealth in the Northern Territory, and Assistant Government Geologist in South Australia. He was also a past president of the Aborigines Protection League and of the Northern Territorians Association.

In 1927 Dr. Basedow entered politics, representing Barossa in the South Australian House of Assembly until 1930. He was also a director in several mining and commercial companies. His most important work, *The Australian Aboriginal* (1925), is a recognized authority on the primitive tribes of Central Australia.

BASKETBALL. Playing under rules radically changed at the end of 1932, basketball teams in

1933 furnished spectators with true spectacles, instead of the technically perfect but often dull exhibitions of the previous few seasons. The new rules, requiring that a team obtaining the ball in its back court advance it across the centre line within ten seconds, and also limiting the time the ball may be held in pivot to three seconds, placed a premium on a speedy attack and obviated the possibility of distasteful stalling in the back court. The regulations were popular in every part of the country and throngs turned out to watch the leading teams in action.

City College of New York, coached by Nat Holman, as usual produced one of the outstanding fives of the country as well as the best in the East. Beaten only once all season, the Metropolitan team easily earned the crown. The lone defeat was suffered at the hands of St. John's College of Brooklyn, another perennial basketball victor, but St. John's dropped four successive games in the last half of the season to lose all claim to titles.

Yale's team, coached by Elmer Ripley, who used to tutor the Georgetown University fives, surprised by taking the Eastern Intercollegiate title, displacing Princeton as titleholder. With a good offense, built around Earl Nikkel and Bob O'Connell, Yale won eight league games out of ten, topping Princeton by one victory. The Princeton veterans bogged down at the start of the season and after a strong mid-season display, were set back by Pennsylvania in the final game. Pennsylvania finished third; Dartmouth, fourth, Columbia fifth, and Cornell sixth.

Ohio State and Northwestern tied for the Big Ten title, succeeding Purdue as champion. Both Ohio State and Northwestern won ten games and lost two. Iowa and Michigan also finished ahead of the defending champion five. Kentucky, with a clean slate in league competition of eight victories and no losses, captured the Southeastern Intercollegiate Conference title, topping Alabama. Vanderbilt finished third with Louisiana State fourth. The University of South Carolina took the Southern Conference tournament, displacing Georgia as champion. Texas University had an easy time winning the Southwest Intercollegiate Conference and Kansas took the Missouri Valley championship.

Wyoming University downed Colorado Teachers in the playoff for the Eastern division of the Rocky Mountain Conference but bowed to Brigham Young University in the final. Brigham Young had won the Western division title by defeating Utah University in the playoff. Oregon State won the Pacific Conference title, downing Southern California in the playoff between the Northern and Southern divisions.

The Diamond D-X Oilers of Tulsa, Okla., took the national A.A.U. title at Kansas City, defeating the Rosenberg-Arvey five of Chicago in the final, 25-23. The Durant Cardinals of Durant, Okla. won the national women's national A.A.U. title.

BASQUE PROVINCES. The three Spanish provinces of Guipúzcoa, Alava, and Vizcaya (Biscay), adjoining the west coast of France at the Pyrenees Mountains. Total area, 2739 square miles. The total estimated population on Jan. 1, 1932 was 904,182. Navarra, which has a predominating Basque population, does not form a part of the Basque Provinces. Chief cities are Vitoria (40,942 inhabitants estimated on Jan. 1, 1932), San Sebastian (80,119), and Bilbao (166,758). Sea fishing, iron mining, and agriculture

are the principal industries. See SPAIN under *History*.

BATES COLLEGE. A nonsectarian college for men and women at Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1933 was 655, of whom 403 were men and 252 were women. In the 1933 summer session there was a total of 205 students, of whom 107 were men, and 98, women. The faculty and administrative officers numbered 57. The permanent funds amounted to \$1,771,310; total expenditures for the fiscal year were \$297,053; and the budget involved an appropriation of \$300,900. The library contained approximately 64,194 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

BATTLESHIPS. See NAVAL PROGRESS.

BAVARIA. One of the component states of the German Republic; declared a republic on Nov. 22, 1918. On Mar. 10, 1933, the Nazis removed the existing republican cabinet from office and appointed Gen. Franz von Epp to be Police Commissary for Bavaria. The following executive appointments were made by the Police Commissary: Special Commissaries—Captain Boehm and Herr Esser; Commissary in the Ministry of Finance—Herr Siebert; Commissary in the Ministry of Justice—Dr. Frank. Area (excluding the Saar), 29,334 square miles; population (1933), 7,703,998. Munich, the capital, had 685,036 inhabitants in 1925; Nuremberg, 393,202; Augsburg, 165,522; Ludwigshafen, 101,869. In 1931, births numbered 137,056; deaths, 93,480; marriages, 55,256. Education is compulsory between the ages of 6 and 16. In 7704 elementary schools, on May 15, 1931, there were 942,141 scholars.

Agriculture and mining are the chief industries. About one-half the total area is under cultivation, the principal crops in 1931 with yields shown in metric tons were: Wheat, 597,888; rye, 589,284; oats, 636,620; barley, 639,164; potatoes, 5,822,663; hops, 5444. The wine yield was 19,270,702 gallons. The livestock census of Dec. 1, 1931 showed 376,296 horses, 3,964,522 cattle, 381,144 sheep, 2,560,819 pigs; 309,096 goats. The mineral output for 1931 in metric tons was: Coal, 1,677,150; iron ore, 293,393; pig iron, 222,575; cast iron, 98,640; sulphuric acid, 260,600. See GERMANY under *History*.

BEACH, HARLAN PAGE. An American missionary and educator, died at Winter Park, Fla., Mar. 4, 1933. He was born at South Orange, N. J., Apr. 4, 1854, and was graduated from Yale in 1878 and from the Andover Theological Seminary in 1883. A missionary to China for the American Board of Commissioners for Foreign Missions of the Congregational Church from 1883 to 1890, he had charge of the School for Christian Workers in Springfield, Mass., from 1892 to 1895, and was educational secretary of the Student Volunteer Movement for Foreign Missions from 1895 to 1906. He then became professor of the theory and practice of missions at Yale University, retiring as professor emeritus in 1921. Until 1928 he delivered lectures on missions at Drew Theological Seminary.

Dr. Beach's works include: *The Cross in the Land of the Trident* (1895); *Knights of the Labarum* (1896); *Dawn on the Hills of T'ang* (1900); *Geography and Atlas of Protestant Missions* (2 vols., 1901, 1903); *India and Christian Opportunity* (1904); *World Atlas of Christian Missions* (co-author, 1911); *Renaissant Latin America* (1916); *World Statistics of Christian*

Missions (co-author, 1916), and *Missions As a Cultural Factor in the Pacific* (1927). He also served as consulting editor of the *Missionary Review of the World*.

BEAUX-ARTS INSTITUTE OF DESIGN.

A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris. For the early history of the Institute see THE NEW INTERNATIONAL YEAR BOOK, 1932. Working under the auspices of the Institute during the year 1932-33 there were 2200 architectural students, 135 students of sculpture, and 135 students of mural painting.

Prizes in architecture and sculpture are offered to students throughout the United States. During the year 1932-33, the committee on education in the department of architecture conducted 36 competitions for the study of architecture and six for the study of archaeology. The most important prize awarded to students through the Institute is the Paris Prize amounting to \$3600, given by the Society of Beaux-Arts Architects, which affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. There is also a traveling scholarship for sculptors amounting to \$1200, the winner being required to spend three months at the Fontainebleau School of Fine Arts and to travel abroad.

The Institute issues a monthly *Bulletin*. The officers elected at the annual meeting in November, 1933, were: Director, Whitney Warren; secretary, Henry R. Sedgwick; director of architectural department, Ely Jacques Kahn; director of department of sculpture, Gaetano Cecere; director of department of mural painting, Hildreth Meiere; director of the department of design, Eugene G. Steinhof; chairman of the board of trustees, Chester H. Aldrich; vice chairman, Philip L. Goodwin. Headquarters are at 304 East Forty-fourth Street, New York City.

BECHTEL, WARREN A. An American contractor, died in Moscow, U.S.S.R., Aug. 28, 1933. He was born on a farm near Freeport, Ill., Sept. 12, 1872, and after receiving a public school education engaged in cattle ranching near Peabody, Kans. During the '90s when the Chicago, Rock Island, and Pacific Railroad was constructing new lines westward from Chickasha, Okla., he hired out his mule teams at \$2.75 a day and was thus employed for several years as a day laborer. In 1900 he acted as foreman on the rebuilding of lines of the Union Pacific Railroad in Wyoming and during 1902-03 was estimator for the Southern Pacific Railroad in the construction of its Central Pacific division. After 1906 he received several important railroad, highway, and irrigation subcontracts from E. B. and A. L. Stone of Oakland, Calif., and the Utah Construction Co., including the construction of a branch of the Western Pacific Railroad, the Klamath River highway in northern California, and a highway through the San Gabriel canyon east of Los Angeles.

In 1914 Mr. Bechtel entered the contracting field for himself, forming in San Francisco, with his two sons and a brother, the firm of W. A. Bechtel Co., which specialized in railroad and public utility construction in the Southwest. Its principal contracts were received from the Santa Fe and Western Pacific railroads. It later became connected with the Transbay Construction Co., which built the foundations of the East Bay section of the projected San Francisco-Oakland Bay Bridge. In August, 1931, Mr. Bech-

tel succeeded to the presidency of the Six Companies, Inc., a syndicate of which his firm was one of the members and which earlier in the year had received the contract for the construction, within seven years at an approximate cost of \$49,000,000, of Boulder Dam, the largest hydraulic project attempted by the Federal government since the building of the Panama Canal. Also, he had been president of the Associated General Contractors of America after 1928. At the time of his death he was touring the Soviet Union, where he had gone especially to visit the Dnieprostroy Dam.

BECHUANALAND (bēch'ōō-ä'nä-länd') **PROTECTORATE.** A protectorate of Great Britain in South Africa, bounded west by South West Africa and east by Southern Rhodesia and the Transvaal. Area, about 275,000 square miles; population (1925 census), 152,983 including 1743 Europeans. The chief native village is Serowe with 25,000 (estimated) inhabitants. In the year 1931-32 there were 119 schools (107 Native, 10 European, and 2 Colored). Cattle rearing and agriculture are the main occupations; the agricultural crop production being dependent on the rainfall. Gold and silver production for 1931-32 was valued at £5507. Government revenues and expenditures amounted to £106,636 and £162,495 respectively for 1931-32; excess of assets over liabilities on Apr. 1, 1932 was £21,775. The protectorate is administered through the native chiefs by a resident commissioner (with administrative headquarters at Mafeking, Cape Province) under the British High Commissioner for South Africa. Resident Commissioner in 1933, Lieut.-Col. C. F. Rey.

HISTORY. On September 14 the native Acting Chief Tshekedi, ruler of the Bamangwato tribe, was tried before a British Court of Inquiry, at Palapye Road, headed by Vice Admiral E. R. Evans, and later sentenced to suspension and banishment because a native court under his direction had sentenced a white man to be flogged. Native courts had no legal right or jurisdiction to try Europeans. On October 4 Tshekedi was reinstated after his mother had made a special plea, and Vice Admiral Evans had felt able to advise the King of England to terminate the period of suspension. The white man who had been flogged for offenses against native women, and another white man, were ordered "banished" from all native territories in Bechuanaland.

BEER. See **TAXATION**.

BEHN, HERNAND. An American capitalist, died at St. Jean de Luz, France, Oct. 7, 1933. He was born at St. Thomas, Virgin Islands, Feb. 19, 1880, and attended St. Thomas's School at Ajaccio, Corsica, and Ste. Barbe's School in Paris. After 1906 he was president of the banking firm of Behn Bros., Inc., which he organized with his brother, Col. Sosthenes Behn, in San Juan, Puerto Rico, in 1904, later extending its operations to New York City. In 1920 he organized with his brother the International Telephone and Telegraph Corp., which, at the time of his death, operated telephone, telegraph, cable, and radio properties in 42 countries. Among its subsidiaries were the Radio Corp. of Cuba, Cuban Telephone Co., and Cuban-American Telephone and Telegraph Co. He was also chairman of the board of the International Marine Radio Co., Ltd.; vice-chairman of the International Standard Electric Corp., Mexican Telephone and Telegraph Co., Puerto Rico Telephone Co., International Com-

munications Laboratories, Inc., International Telephone and Telegraph Laboratories, Inc., and president of the Havana (Cuba) Subway Co.

In 1930 the International Telephone and Telegraph Corp. presented to and installed in Vatican City its telephone system, Pope Pius XI conferring on Mr. Behn, in recognition of this gift, a commandery of the Order of St. Gregory the Great and the Grand Cross of the Order of the Holy Sepulchre. As one of the principal donors of the Vatican City's wireless system, he received from the Pope in 1933 the Grand Cross of the Order of St. Gregory the Great. He was also the recipient of the Grand Cross of the Order of Isabella the Catholic for his services in modernizing the telephone system of Spain.

BELGIAN CONGO. See CONGO, BELGIAN.

BELGIUM. A kingdom of Western Europe. Capital, Brussels. Reigning sovereign in 1933, Albert I, who succeeded to the throne Dec. 17, 1909.

AREA AND POPULATION. Including the districts of Eupen and Malmédy, ceded to Belgium by the Treaty of Versailles, the area is 11,752 square miles. The population was estimated at 1,519,185 on Dec. 31, 1931, compared with 8,092,004 at the census of Dec. 31, 1930. The population per square mile in 1931 was 694. Foreigners in the country in 1930 numbered 316,982, with French, Dutch, Poles, and Italians predominating. The movement of population in 1931 was: Living births, 148,538; deaths, 108,017; marriages, 66,168; divorces, 2531. Emigration in 1931 was 19,252 (17,515 to European countries); immigration, 32,045. The chief cities, with estimated populations on Dec. 31, 1931, were: Brussels and suburbs, 834,522; Antwerp (Anvers), 284,811; Ghent (Gand), 170,576; Liège (Lutich), 165,657.

EDUCATION. In addition to the numerous private and free schools, mostly under ecclesiastical control, there were on Dec. 31, 1931, 8549 primary schools, with 917,122 pupils; 3972 infant schools, with 249,799 pupils; and 1357 adult schools, with 37,798 pupils. For secondary education there were 230 schools of various types, with 52,928 students; also 31 technical and commercial high schools and other vocational institutions. Enrollment in the four universities in 1931-32 was: Brussels, 2721; Ghent, 1881; Liège, 2734; and Louvain, 4071. Liège and Ghent are state universities. French and Flemish are the languages of instruction.

PRODUCTION. The census of 1920 showed 1,466,646 persons engaged in mining and industry, compared with 566,340 in commerce and transport, 477,658 in agriculture, 173,037 in the civil service, 116,017 in liberal professions, and 160,081 in domestic service. In 1931, 3,042,000 acres, or 40 per cent of the total area, was under cultivation; there were 1,327,000 acres of permanent meadows and pastures and 168,000 acres of orchards. The estimated production of the chief crops in 1932, with 1931 figures in parentheses, in quintals of 220.46 pounds, was: Wheat, 4,185,000 (3,761,000); rye, 6,010,000 (4,809,000); barley, 1,023,000 (875,000); oats, 7,604,000 (7,023,000); potatoes, 44,390,000 (35,769,000); sugar beets 17,361,000 (14,655,000); tobacco, 62,000 (66,000); beet sugar in 1932-33, 2,480,000 (2,006,000). Livestock at the beginning of 1932 included 241,989 horses, 1,767,536 cattle, and 1,235,214 swine.

The index of Belgian industrial production

(base: 1928 = 100) declined from an average of 100 for 1929 to 90 for 1930, 79 for 1931, and 68 for 1932. Mining and metallurgical (provisional) output in 1932, with 1931 figures in parentheses, was (in metric tons): Coal, 21,413,560 (27,035,560); briquettes, 1,320,750 (1,850,330); coke, 4,476,099 (4,931,060); pig iron, 2,783,500 (3,231,680); wrought iron, 35,480 (62,880); steel, 2,758,280 (3,056,450); wrought steel, 2,054,470 (2,350,600). The average number of workers employed by the coal mining companies in July, 1933, was 223,904. The totally unemployed on June 30, 1933, numbered 145,000; partially unemployed, 156,000. The percentage of unemployed workers in leading industries on Mar. 31, 1933, was: Building, 27.9; engineering and metallurgy, 21.6; textiles, 17.6; food, 9.7; mining, 4.5. The chief industries are iron and steel, rayon, glass, lace, linen, gloves, and automobiles. The effect of the world depression upon the Belgian price structure was to lower wholesale prices 40.8 per cent and retail prices 16.8 per cent between 1929 and March, 1933.

COMMERCE. Since the conclusion of the Customs Union with Luxembourg on Mar. 5, 1922, Belgian foreign trade statistics have been combined with those of Luxembourg. The decline in imports and exports during the period 1929 to 1932 is shown in the accompanying table.

BELGIUM: IMPORTS AND EXPORTS
[In paper francs worth \$0.0278 at par]

Year	Imports 1,000 francs	Exports 1,000 francs	Excess of imports 1,000 francs
1929 . .	35,623,791	31,879,905	3,743,886
1930 . .	31,047,016	26,151,571	4,895,445
1931 . .	23,964,566	23,235,797	728,769
1932 *	16,424,375	15,130,450	1,293,925
1933 *	15,217,000	14,328,000	889,000

* Figures are provisional

Of the 1932 imports, raw materials accounted for 7,203,147,000 paper francs; manufactures, 4,794,661,000; foodstuffs and beverages, 4,158,171,000; gold and silver in bullion and coin, 165,087,000; and live animals, 103,309,000. The distribution of exports by the same classes was: Manufactures, 7,928,652,000 paper francs; raw materials, 5,309,159,000; foodstuffs and beverages, 1,429,414,000; gold and silver, 310,833,000; and live animals, 152,392,000. The United Kingdom, France, Germany, the Netherlands, and the United States are Belgium's leading markets and sources of imports.

FINANCE. The ordinary budget for the fiscal calendar year 1931 showed a deficit of about 1,500,000,000 paper francs, with expenditures of 11,977,000,000 francs. The estimated deficit in the extraordinary budget was 713,000,000 francs. For 1932, there was a deficit of about 2,200,000,000 francs on the ordinary budget, with expenditures of 11,180,000,000 francs. A further deficit of 293,000,000 francs on the extraordinary budget was anticipated. The 1933 budget, as passed by parliament, anticipated a deficit of 622,000,000 francs, with total expenditures of 11,503,000,000 francs and total revenues of 10,881,000,000 francs.

The public debt on Dec. 31, 1932, totaled 55,852,000,000 Belgian francs (internal debt, 28,320,000,000 francs; external, 26,398,000,000 francs). In August, 1933, the government was authorized to raise 3,300,000,000 francs for unemployment relief works.

COMMUNICATIONS. Belgium in 1932 had 2995 miles of main railway line, owned by the state

but operated by a private company; 6438 miles of highways, 1030 miles of navigable rivers and canals, and about 497 miles of airways. In 1932, Sabena, the Belgian air system, transported 8478 passengers (7721 in 1931), 545,000 pounds of freight (680,000 in 1931), and 77,500 pounds of mail (98,100 in 1931). The Belgian merchant fleet on July 1, 1932, consisted of 240 vessels of 537,442 tons. Idle steam and motor shipping totaled 139,000 gross tons on July 1, 1933, and 187,000 gross tons a year earlier.

GOVERNMENT. Belgium is a constitutional monarchy, in which the King exercises the executive power through a ministry responsible to parliament. Legislative power is vested in the King and in parliament. Parliament consists of a senate of 159 members elected for four years partly by direct and partly by indirect vote and a house of representatives of 187 members elected for four years by direct suffrage. The composition of the Senate following the election of Dec. 4, 1932, was: Catholics, 75; Socialists, 65; Liberals, 18; Frontist (Flemish autonomists), 1. The House of Representatives elected Nov. 27, 1932, included 79 Catholics, 73 Socialists, 24 Liberals, 8 Frontists, and 3 Communists. The Liberal-Catholic coalition cabinet appointed Dec. 17, 1932, was headed by Count Charles de Broqueville (Catholic).

HISTORY

THE BUDGET PROBLEM. In Belgium, as in many other countries, the most pressing domestic problem confronting the government was that of balancing the budget. Successive budget deficits had been met by large foreign and domestic loans, raised at high rates of interest. When Parliament reassembled on Jan. 18, 1933, the government was running a monthly deficit of about \$9,000,000 and a serious financial crisis was in prospect, despite the heavy increases in taxation and reduction of expenditures initiated in 1932.

The de Broqueville Ministry attempted to bring the budget more nearly into equilibrium by imposing further taxes and by reducing unemployment benefits. These steps aroused widespread demonstrations by taxpayers on the one hand and by the unemployed, the Socialists and Communists on the other. In spite of higher taxes and economies, the government at the beginning of May reported that it faced a 600,000,000-franc deficit in the 1933 budget. It requested and obtained from Parliament on May 17 a law granting the Cabinet special powers for improving the financial situation and balancing the budget. Under this law the government on June 1 published a series of economy decrees, calculated to reduce expenditures by 800,000,000 francs. The decrees cut all government salaries and pensions by 5 per cent, reduced government subsidies by 20 per cent, changed the unemployment relief benefits and legislation and provided for compulsory work for the unemployed. These decrees aroused further criticism from various groups and when Parliament reassembled July 19, the government was forced to modify some of them to retain support. The ministry won a vote of confidence on its general economy measures July 23. Shortly afterward, Parliament adjourned, reassembling October 17 to discuss the complete budgets for both 1933 and 1934. The budget had not been adopted by the end of the year. In December a 35-year 600,000,000 French franc loan was successfully floated to retire 500,-

000,000 French francs in Treasury notes which fell due Jan. 5, 1934.

RELATIONS WITH GERMANY. As in previous years, Belgian relations with Germany had direct repercussions upon the financial problem. The Hoover Moratorium of 1931, indefinitely prolonged by the Lausanne Conference of 1932, deprived the Belgian budget of some 600,000,000 francs annually in German reparations. Due partly to this fact and to the critical budgetary position, the government in 1933 continued its refusal to pay war debt installments due the United States government (see **REPARATIONS AND WAR DEBTS**). The advent of the Hitler government aroused Belgian fears of a new German aggression. Despite its financial difficulties, the government authorized heavy financial expenditures for the fortification of the German frontier. On October 1, the Minister of War received Cabinet approval of a credit of 750,000,000 Belgian francs (about \$157,500,000) to carry out a two-year programme for improvement of fortifications and of the army. The activity of German Nazis along the frontier and in the districts of Eupen and Malmédy, ceded to Belgium by the Versailles Treaty, increased Belgian fears and enlisted the support of most parties for the defense expenditures.

Economic relations between Belgium and Germany showed improvement during October, following the German government's pledge to pay three-fourths of the annual sum due under the Young Plan for repayment of German paper marks left in Belgium after the armistice. Germany had suspended payments on this special account the previous spring.

COMMERCIAL POLICIES. In accordance with recommendations submitted by Georges Theunis, former Premier, the Belgian government in August adopted a policy of limiting imports from countries with which the balance of trade was unfavorable to Belgium. Attempts to negotiate a trade convention on this basis with Argentina broke down on November 30 after several months of discussion and Belgium proceeded to limit its heavy imports of meat, wheat, and other raw materials from Argentina. The balance of trade with that country was distinctly unfavorable, Belgian exports to Argentina amounting to about 350,000,000 Belgian francs, while imports from Argentina were about 1,100,000,000 francs. Similar negotiations were in progress with the Netherlands, Germany, the United States and other countries during the year.

OTHER DEVELOPMENTS. On Sept. 10, 1933, two tunnels connecting Antwerp with the left bank of the Scheldt were formally opened, one being for vehicles and the other for pedestrians.

BELGIUM EDUCATIONAL FUND. See **UNIVERSITIES AND COLLEGES.**

BELMONT, ALVA E. SMITH. An American feminist, died in Paris, France, Jan. 26, 1933. She was born in Mobile, Ala., Jan. 17, 1853, the daughter of Murray F. Smith, and was educated at a French convent. After her marriage in 1874 to William K. Vanderbilt, scion of the New York family of steamboat and railroad fame, she became a forceful leader in American social life. She was the mother of Consuelo (at one time, the Duchess of Marlborough) and Harold S. and William K. Vanderbilt, Jr. Following her divorce in 1895 she was married to Oliver H. P. Belmont, and after his death in 1908 became actively and generously interested in movements for social

betterment, such as the establishment of hospitals and children's homes, the abolition of child labor, and the improvement of working conditions for women in industry.

Mrs. Belmont was known preëminently, however, for her efforts in the cause of woman's rights, being an ardent suffragist and founder and later president of the Political Equality Association. She was also an organizer of the National Woman Party's Convention, held in San Francisco and Washington in 1915 and composed of delegates from the 12 States which had granted full suffrage to women. After the passage of the Nineteenth Amendment she devoted her efforts to obtaining legal equality for women, both nationally and internationally.

BENDIX TROPHY. See AERONAUTICS.

BENNETT CUP RACE. See AERONAUTICS.

BENSON, STELLA. A British novelist, died at Hongai, Tongking, French Indo-China, Dec. 7, 1933. Born at Much Wenlock, Shropshire, England, Jan. 6, 1892, she was educated privately, mostly in France, Switzerland, and Germany. In 1914 she took an inconspicuous part in the woman suffrage movement and during the War worked on London's East Side. In 1918 she went to the United States where, after engaging in many and varied occupations that ranged from proof-reading to stunt flying, she eventually made her way to San Francisco and from there sailed for China in 1921. In the latter year she was married to J. C. O'Gorman Anderson, an official of the Chinese Customs Service, and afterwards resided largely in China.

Miss Benson's most notable novel was *Tobit Transplanted* (1931, published in the United States as *The Faraway Bride*), a tale of expatriated White Russians in China which received the Femina Vie Heureuse Prize in 1932. Among her other works, all noted for their subtle blend of satire, were *I Pose* (1915); *This Is the End* (1917); *Twenty* (1918); *Living Alone* (1919); *The Poor Man* (1922); *Pipers and a Dancer* (1924); *The Little World: Sketches of Travel* (1925); *Good-bye, Stranger* (1926); *Worlds within Worlds* (1928); *The Man Who Missed the 'Bus* (1928); *Hope against Hope* (1931); *Christmas Formula* (1932); and *Pull Devil, Pull Baker* (1933).

BEREA COLLEGE. A nonsectarian, coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1933 was 1511, distributed as follows: College, 642; academy, 518; foundation-junior high school, 316; nurses, 35. The enrollment in the summer session of 1933 was 302, of whom 205 were in the college, 76 in the academy, and 21 were nurses. The faculty numbered 109. The endowment amounted to \$9,063,022.77, and the income for the year ending June 15, 1933, was \$588,636.80. The library contained about 65,700 volumes. The college of arts and sciences is enriching its curriculum by the extension of the work in the Fine Arts to a full department, and by the addition of theory and practical work in music, making possible music majors in Piano, Violin, Voice, Pipe Organ, and Public School Music. President, William J. Hutchins, DD., LL.D.

BERGER, FRANCESCO. A British pianist and composer, died Apr. 26, 1933, in London, where he was born June 10, 1834. He studied with

Lickl in Vienna and with Hauptmann and Plaidy in Leipzig, and in 1855 became professor of piano at the Royal Academy of Music in London. He taught also until 1924 at the Guildhall School of Music and made frequent concert tours throughout the British Isles. For some years he was director, and from 1884 to 1911 honorary secretary, of the Philharmonic Society. In addition to many songs and pieces for the piano, violin, and 'cello Professor Berger composed the opera *Il Lazzarone* and the overtures and incidental music to *The Lighthouse* and *The Frozen Deep*, plays written by Wilkie Collins and acted by Charles Dickens and his friends at their famous private theatricals. He wrote *First Steps at the Pianoforte* and *Vocabulary of Musical Expressions* and published his memoirs under the title *Reminiscences, Impressions and Anecdotes* (1913).

BERMU'DA. A British owned colony in the North Atlantic about 580 miles east of North Carolina and 677 miles from New York, consisting a group of 360 small islands about 20 of which are inhabited. Because of its warm climate and picturesqueness it is a favorite resort for American tourists. Area, 19.3 square miles; civil population (1931 census), 27,789 including 11,353 white. Hamilton, the capital with 3250 inhabitants, is an important naval base.

In 1932 there were 55 schools; education of children from 7 to 13 years of age is compulsory. Government revenues and expenditures for 1932 were £462,607 and £443,501 respectively. The chief products are potatoes, lily bulbs, onions, and other vegetables which are raised principally for the United States and Canadian markets. Imports (excluding government stores) were valued at £1,891,526 in 1932; exports totaled £93,461. Shipping entered and cleared in 1932 aggregated 7,794,558 tons. The government is administered by a governor, assisted by an executive council of 7 members and a legislative council of 9 members both appointed by the Crown and an assembly of 36 members elected by about 1350 electors. Governor in 1933, Sir T. A. Cubitt.

BESANT, bès'ant, ANNIE (WOOD). A British Theosophist, died at Adyar, India, the world headquarters of the Theosophical Society, Sept. 20, 1933. Born in London, Oct. 1, 1847, the daughter of William Page Wood, she attended private schools in England, Germany, and France in 1867 was married to the Rev. Frank Besant, a Church of England clergyman. She was legally separated from her husband six years later, but on account of the agnostic views which she had acquired she was deprived of the custody of her two children. In 1874 she joined the National Secular Society, where for almost 15 years she was associated with Charles Bradlaugh, the Radical politician and social reformer, serving as vice-president of the society and co-editor of the *National Reformer*. Becoming interested in Socialism of a more revolutionary type, she joined the Fabian Society and the Social Democratic Federation in 1885 and took an active part in organizing trades unions among unskilled laborers. During 1887-90 she represented Tower Hamlets, as a Labor and Socialist member, on the London School Board.

Mrs. Besant next came under the influence of Helena P. Blavatsky, founder of the Theosophical Society, and in 1889 announced her conversion to that system of Neo-Platonism. Rising rapidly

in Mme. Blavatsky's favor, she was appointed on the latter's death in 1891 leader, with William Q. Judge, of the Esoteric Section, the inner body of the Theosophical Society. After 1907 she was president of the society, editing its organ, *The Theosophist*, and directing the propagation of its doctrines through branches in 48 nations. The core of these doctrines was belief in an unknowable, absolute, divine Principle as the source of the manifested universe and in the identity of all souls with a universal Oversoul, all pursuing their pilgrimage toward ultimate perfection through many lives on earth, in which each reaps the exact harvest of its own sowing. In 1910 Mrs. Besant founded the Order of the Star through which she wished to prepare the way for Jeddū Krishnamurti, an Indian youth who had been revealed to her as the "vehicle" of the World Teacher. Krishnamurti's action in renouncing the "mastership" after their tour of England and the United States in 1926-27 was said to have saddened her last years.

In India Mrs. Besant found fulfillment for her early desires as a social reformer. She early devoted herself to the spread of education, founding at Benares in 1898 the Central Hindu College and in 1904 the Central Hindu Girls' School and helping to found there the Hindu University. During the early part of the World War she identified herself with the Indian Nationalist movement, forming the Home Rule League for India, of which she was president in 1916, and editing the Madras daily *New India*, through which she expounded her views on Indian independence. For this action she was interned for a while by the government of Madras. She continued her nationalistic support on her release, however, serving in 1917 as president of the Indian National Congress which demanded home rule for India in 10 years. The following year, though, she dissociated herself from the Congress's extreme wing and supported the proposed Chelmsford-Montague reforms. In 1923 she was general secretary of the National Convention of India.

Mrs. Besant's influence waned after Gandhi's ascendancy, but she continued to write on India's political future, her last works being *India, Past, Present, and Future* (1926) and *A Bird's Eye View of India's Past as the Foundation for India's Future* (1930). Also she published such noteworthy books on Theosophy as *Reincarnation* (1892); *Seven Principles of Man* (1892); *Death and After* (1893); *Building of the Kosmos* (1894); *The Self and Its Sheaths* (1895); *Path of Discipleship* (1896); *Man and His Bodies* (1896); *Four Great Religions* (1897); *The Ancient Wisdom* (1897); *Three Paths to Union with God* (1897); *Evolution of Life and Form* (1898); *Esoteric Christianity* (1901); *Theosophy and the New Psychology* (1904); *The Wisdom of the Upanishats* (1906); *The Basis of Morality* (1915); *A World Religion* (1916); *H. P. Blavatsky and the Masters of the Wisdom* (1918); *Man's Life in Three Worlds* (1919); *The Riddle of Life and How Theosophy Answers It* (1922); and *Theosophic Christianity* (1922). Her autobiography appeared in 1920.

BESSARABIA, bēs'ā-rā'bl-ā. A territory joined to Rumania on Apr. 11, 1918, formerly a province of the Russian Empire. It occupies the northeastern portion of Rumania and has an area of 17,146 square miles; population (1930 census), 2,865,506. See **RUMANIA** under *History*.

BETHELL, UNION NOBLE. An American industrialist, died at Montclair, N. J., Jan. 13, 1933. He was born at Newburgh, Ind., Sept. 12, 1859, and was graduated from Hanover College in 1879. On receiving the LL.B. degree from Columbian (later George Washington) University in 1885 he practiced law for several years in Evansville, Ind. With his appointment in 1889 as secretary and treasurer of the New York and New Jersey Telephone Co. began his long association with the Bell Telephone System. In 1893 he was made general manager of the Metropolitan Telephone and Telegraph Co., and in 1896 vice-president and general manager of its successor, the New York Telephone Co. He later assumed not only the presidency of the New York Telephone Co. but that of various regional companies of the Bell System, including the Chesapeake and Potomac Telephone Co., operating in Washington, Baltimore, and surrounding territory; the Bell Telephone Co. of Pennsylvania; the Delaware and Atlantic Telephone and Telegraph Co.; and the Diamond State Telegraph Co. On the grouping of these companies in 1909 into one operating unit under the control of the American Telephone and Telegraph Co. he accepted the office of first vice-president of that organization. During the World War he was chairman of the operating board of the United States Telephone and Telegraph Administration.

Mr. Bethell served as adviser to various foreign telephone and telegraph administrations, and in recognition of his service in adapting the telephone to conditions in Japan was decorated with the Imperial Order of the Rising Sun. After his retirement in 1919 from the presidency of the New York Telephone Co., the vice-presidency of the American Telephone and Telegraph Co., and the directorship of several other Bell telephone companies throughout the United States he devoted himself to various civic and philanthropic projects. Among these was the chairmanship during 1921-22 of the executive committee of the American Committee for the China Famine Fund. During 1925-27 he was a member of the joint legislative commission of New York and New Jersey, appointed to determine the taxation of property in connection with the construction of the Holland Vehicular Tunnel.

BIBLE SOCIETY, AMERICAN. Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment" and without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without profit, and below cost or donated free when circumstances justify. During the 117 years of its existence the society has issued 246,046,560 volumes and participated in the translation, publication, and distribution of the Scriptures in more than 300 languages, dialects, and versions.

The work in the United States is carried on through 10 home agencies and some 100 auxiliary, State and local, Bible societies. Latin America and the Near East and Far East are covered by 12 additional agencies, while correspondents help carry on the work in other countries, especially in Europe and Africa. During 1932 the society issued 8,067,156 volumes in 180 languages. The number issued in the United States was 3,815,966 and in foreign lands 4,251,190. Engaged in this distribution were 3645 agency secretaries, sub-agents, colporteurs, correspondents,

and volunteers, of whom 1618 worked in the United States and 2027 in foreign lands.

In the translation field during 1932 an entire book of the Bible (the Gospel according to St. Matthew) was for the first time translated into the language of the Keres Indians of New Mexico and into the dialect of the Kalajiski gypsies of central Bulgaria. The Gospel according to St. John was published in parallel columns in Valiente and Spanish for a tribe of Indians in Panama. The revision of the Turkish New Testament was completed, while revision of the Old Testament was inaugurated with the publication of the Psalms. In Siam the Tai Lu New Testament translation was nearly completed. In the Philippines work proceeded on the translation of the Samaritan Old Testament, the Psalms being published in Manila, and the revision of the Ilocano Old Testament and the Ibanag New Testament.

The budget of the society for 1932 was \$1,180.-248. The officers in 1932-33 were: J. Frederick Talcott, president; the Rev. Eric M. North, Ph.D., D.D., and the Rev. George William Brown, D.D., general secretaries; the Rev. Lewis B. Chamberlain, D.D., recording secretary; Gilbert Darlington, treasurer; and Charles W. Fowle, assistant secretary. Headquarters of the society are in the Bible House, Astor Place, New York City.

BICYCLING. See CYCLING.

BIGGERS, EARL DERR. An American author, died in Pasadena, Calif., Apr. 5, 1933. He was born at Warren, O., Aug. 26, 1884, and was graduated from Harvard University in 1907. From 1908 to 1911 he was identified with the Boston *Traveler* as conductor of a humorous column and as dramatic critic. He removed to New York City in 1911 and turned his talents to fiction and play-writing, making his debut in 1912 with the comedy, *If You're Only Human*. The following year he published *Seven Keys to Baldpate*, the dramatic version of which, with George M. Cohan in the lead, was an outstanding success. There was also produced in 1913 *Thieves*, which he wrote in collaboration with Grover Harrison. In 1914 appeared his novel *Love Insurance* and the following year the play *Inside the Lines*, which achieved a record run of 500 performances in London. In collaboration with William Hodge he wrote *A Cure for Curables* (1917), in which Hodge starred for two years. His last productions on Broadway in 1919 were the musical comedy *See-Saw* and the farce *Three's a Crowd*, which he wrote with Christopher Morley.

On removing to Hollywood to engage in scenario writing Biggers turned his skill to the development of mystery plots, several of which centred about the fictional Chinese detective, Sergeant Charlie Chan. These included *The House without a Key* (1925); *Fifty Candles* (1926); *The Chinese Parrot* (1926); *Behind That Curtain* (1928); *The Black Camel* (1929); *Charlie Chan Carries On* (1930); and *Keeper of the Keys* (1932).

BILES, SIR JOHN HARVARD. A British naval constructor, died in London, Oct. 27, 1933. Born at Portsmouth, England, Jan. 6, 1854, he attended the Royal School of Naval Architecture and Marine Engineering and the Royal Naval College at Greenwich, and in 1877 entered the service of the British Admiralty as naval constructor. Four years later he became naval architect and manager to the Clydebank shipyard and was

elected Master of the Worshipful Company of Shipwrights. In 1891 he was called to the chair of naval architecture at Glasgow University, where he remained until 1921. During this period he served on various departmental committees of the Admiralty, including mercantile auxiliaries (1901), torpedo boat destroyer (1902-03), and warship designs (1905), and in 1905-06 was a member of the departmental committee on tonnage of the British Board of Trade. In 1911 he was president of the engineering section of the British Association for the Advancement of Science, in 1912 an assessor in the investigation of the *Titanic* disaster, and in 1913 British delegate to the International Conference on Safety of Life at Sea.

During the World War Sir John designed and supervised the construction of river craft for the British Expeditionary Force in Mesopotamia and in 1917 was chairman of the Admiralty committee on submarine cargo vessels. In 1923 he was appointed a member of the Indian Mercantile Marine Committee, serving at the time of his death as consulting naval architect to the High Commissioner for India. He was also a member in 1925 of the committee on Royal dockyards and their organization and during 1925-26 was chairman of the Engineering Joint Council. In 1929 he served as a witness before the Board of Trade to determine the cause of the sinking of the *Vestris*. He was knighted in 1913 and was created a Knight Commander of the Indian Empire in 1922. His publications included *The Marine Steam Turbine* (1906) and *Design and Construction of Ships* (1908).

BILLIARDS. The downfall of Ralph Greenleaf, perennial holder of the world's pocket billiard championship, as he sought his thirteenth title, was the highlight of the 1933 billiard campaign. Undeclared in 1931 and 1932 Greenleaf met with defeat seven times in the tournament at Chicago in December and yielded his crown to Erwin Rudolph, of Cleveland. Greenleaf had been dethroned before but never in recent seasons had he suffered as disastrous a session of play as in the Chicago championship tournament. Rudolph and Andrew Ponzi of Philadelphia met in the final and the former triumphed, 125 to 113, to regain the title he last won in 1930. The three-cushion championship also changed hands, Welker Cochran of San Francisco succeeding Augie Kieckhefer of Chicago. The other two major professional billiard titles, the 18.2 balkline and the 18.1 balkline, remained in the possession of their holders, as no tournament play was scheduled because of lack of competitors as well as lack of money with which to stage the tournaments. Willie Hoppe is 18.1 champion and Jacob Schaefer Jr., titleholder at 18.2. Cochran is also national professional 18.2 champion, having taken the title in 1930.

In a professional cushion-carom match, the first played since 1883, Willie Hoppe defeated Schaefer, 1500 to 1012. Hoppe also won a three-cushion challenge match, downing Cochran, 600 to 567.

There were few changes in the amateur billiard championship roster. Albert Poensgen of Germany, who had captured the world's 18.2 balkline championship in New York in 1932, lost his laurels to Edmond Soussa of Egypt at Berlin. Edgar T. Appleby of New York, became the first American ever to annex the world's 18.1 balkline title by triumphing in an international field at New York in March. A. Robyns of Holland was

not called upon to defend his world's three-cushion crown. Appleby won the title by turning in five victories in the six matches, and his brother, Francis, finished in a triple tie for second place with Edmond Soussa of Egypt and Theodore Moons of Belgium, each of whom won four and lost two. Edgar Appleby succeeded Albert Corti of France as champion.

The national amateur pocket billiard championship was taken by J. Howard Shoemaker of Bridgeton, N. J. for the eighteenth time since 1913. His 1933 victory came after a challenge match. Ed Fagan of New York toppled Shoemaker in the regular tournament but the loser took advantage of an opportunity to challenge for the title and defeated Fagan. Edward L. Lee of the New York Athletic Club retained his national three-cushion title and Charles Shongood, Jr., successfully defended his snooker laurels. Lester Fischer of Brooklyn won the Poggenburg Memorial Cup as well as the class B pocket billiard crown. The national 14.2 tournament was not held, Orlando C. Bennett, of New York, retaining his title.

BIRMINGHAM-SOUTHERN COLLEGE.

A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1933 was 742 full-time students, and 387 part-time students, and for the summer session 369. There were 57 faculty members. The endowment amounted to \$783,011, and the income for the year was \$242,644. There were 40,000 volumes in the library. President, Guy Everett Snavelly, Ph.D., LL.D.

BIRRELL, AUGUSTINE. A British barrister, politician, and author, died in London, Nov. 20, 1933. He was born at Wavertree, near Liverpool, Jan. 19, 1850, graduated in 1872 from Trinity Hall, Cambridge, and in 1875 was admitted to the bar at Lincoln's Inn. On being made Queen's Counsel in 1893 he practiced for a time in the Chancery courts, and from 1896 to 1899 was Quain professor of law at University College, London. In 1903 he was appointed a bencher of the Inner Temple. His Parliamentary career began in 1889 when he was returned to the House of Commons as Liberal member for West Fife. Defeated in the election of 1900, he was returned for North Bristol in 1906 and continued to represent that constituency until 1918.

Birrell was president of the Board of Education in the cabinet of Sir Henry Campbell-Bannerman during 1905-07, achieving distinction for the successful passage in the House of Commons of an Education Bill designed to settle the question of religious instruction. In 1907 he was appointed chief secretary to the Lord Lieutenant of Ireland and immediately after taking office prepared the Irish Councils Bill in an attempt to placate the Nationalists. The bill, however, was strongly opposed by the Sinn Fein. The following year he drew up the Irish Universities Act, under which Queen's University at Belfast, the National University at Dublin, and the Queen's colleges at Cork and Galway came into existence. In 1911 he prepared the third Home Rule Bill which called for a bicameral Irish Parliament, with an executive responsible to it and with full representative powers and

control over purely Irish concerns. This bill was introduced by Asquith in the Parliamentary sessions of 1912-14, but in spite of successive amendments no agreement was reached between John Redmond, leader of the Nationalists, and Sir Edward Carson, leader of the Ulster Unionists. Civil war seemed imminent when a truce was declared by both parties as a result of Great Britain's entry into the World War. Birrell tendered his resignation after the suppression of the Easter rebellion of 1916, led by extremists of the Sinn Fein who held that Ireland should no longer wait for Home Rule as a gift from the British Parliament.

As a man of letters, Augustine Birrell achieved a unique place with the publication in 1884 of his first volume of essays, *Obiter Dicta*. His power of analysis, his epigrammatic wit, and his urbanity combined to form a style whose easy grace evoked the word "birrelling." A second series of this title appeared in 1887 and in 1924 a third, entitled *More Obiter Dicta*. Other volumes of this nature were: *Res Judicatae* (1892); *Men, Women, and Books* (1894); *Collected Essays* (1900); *Miscellanies* (1901); and *Et Cetera* (1930). He wrote several biographies, including *Life of Charlotte Brontë* (1885); *Sir Frank Lockwood* (1898); *William Hazlitt* (1902); *Andrew Marvell* (1905); and *Frederick Locker Lampson* (1920). Among his publications on legal topics were *Lectures on the Duties and Liabilities of Trustees* (1896) and *Seven Lectures on the Law and History of Copyright in Books* (1899). He also held high honors in the educational field, being honorary fellow of Trinity Hall, Cambridge, after 1899 and Lord Rector of Glasgow University after 1911.

BLACK, MAJ.-GEN. WILLIAM MURRAY, U. S. A., RET. An American soldier and civil engineer, died in Washington, D. C., Sept. 24, 1933. Born at Lancaster, Pa., Dec. 8, 1855, he attended Franklin and Marshall College and in 1877 was graduated from the United States Military Academy. After acting as assistant instructor in practical military engineering at the Academy he became engaged on various river and harbor improvement works under the auspices of the Engineers' Corps, rising to the rank of colonel. Transferred to Washington as assistant in the office of the chief of engineers in 1895, he was credited with introducing into the United States the use of reinforced concrete in defense construction. While acting as engineer commissioner of the District of Columbia during 1897-98 he prepared and secured the adoption of plans for the abolition of railroad grade crossings in the district.

During the Spanish-American War General Black was chief engineer of the American forces in the Puerto Rican campaign, commanding the Third Army Corps on its landing at Guanica. Subsequently he was commissioned chief engineer of the Fifth Army Corps. After the war he served as chief engineer first of the Department of Havana and then of the Division of Cuba, having charge of such improvements as the cleaning of streets and parks and the rehabilitation of public buildings which contributed to the eradication of yellow fever in the island. He prepared

also a code of sanitary regulations which was later incorporated in the general law of the republic. On his return to the United States he was appointed commanding officer of the Engineering School of Application in Washington, introducing there a system of industrial training. In 1903 he was named by the Isthmian Canal Commission observer on the construction work of the Panama Canal.

General Black next had charge of river and harbor improvements and fortifications in Maine, but in 1906 he was recalled to Cuba as adviser to the department of public works of the provisional government. From 1909 to 1916 he was principally engaged as chief engineer of the Eastern Department in supervising river and harbor improvements and fortifications along the Atlantic coast. He served also during 1910-13 as senior member of the board of engineers, charged with raising the wreck of the *Maine* from Havana harbor, and sat on the Army and Navy board appointed to determine, if possible, the cause of the vessel's explosion. According to the board's report proof of external explosion was beyond question.

In 1916 General Black was appointed chief of engineers of the United States Army, with the rank of brigadier-general. The following year he was promoted to major-general. He was active in the organization of the Engineer Officers Reserve Corps, and after the entry of the United States into the World War took personal charge of the mobilizing of the first engineer units of the National Army. The engineering branch of the Army was expanded under his direction to a war-time strength of 350,000 troops, a portion of which were used as the transportation regiments of the American Expeditionary Forces. In recognition of this service he was awarded the Distinguished Service Medal in 1918. He served also as chairman of the advisory committee on inland water transportation, first under the Council of National Defense and later under the Federal Railroad Administration, as a member of the military section of the National Research Council, and as chairman of the port and harbors facilities commission of the United States Shipping Board.

On his retirement in 1919 General Black became a member of the consulting engineering firm of Black, McKenney, and Stewart in Washington. He was a past president of the Society of American Military Engineers and with Earle B. Phelps invented a method of purifying sewage by aeration.

BLACKHEAD OF TURKEYS. See VETERINARY MEDICINE.

BOBSLEDDING. The sport of bobsledding, which received much notice in the Olympic year of 1932 when the sport was the main attraction at the winter games, continued in popularity in 1933. At the Mt. Van Hoevenberg bob run at Lake Placid, N. Y., the team of J. Hubert Stevens, John Shene, E. D. C. Cameron, and Donald DeLoria won the North American four-man event with a total for four heats of 7m: 12.51s, of which the fastest heat was 1m: 46.16s. J. Hubert Stevens and DeLoria won the North American two-man event with a total time for four heats of 8m: 00.21s.

The National A.A.U. four-man bob crown was taken by Curtis Stevens' team, composed of himself, Charles Devine, Robert Martin, and E. H. Varno. The two-man title went to the Hubert Stevens and DeLoria. The Junior four-man cham-

pionship was taken by Raymond Stevens steering Crawford Merkel, Vincent Stanley, and Sherwood Ernenwein as his crew. The World's two-man laurels were won in Germany by the Rumanian team of Capt. Dmitri Hubert and Lieut. Al Papana.

BOHEMIA. A province occupying the western part of Czechoslovakia; formerly a crownland of Austria. Bohemia is represented in the Czechoslovak legislature by 9 deputies and 5 senators. See CZECHOSLOVAKIA.

BOILERS. Steam boilers and their appurtenances have steadily improved in reliability and a recent survey of a large number of central-station boilers disclosed an average availability factor of 80 to 82 per cent. Such reliability has had much to do with the trend toward unit layout, as embodied in the designs of several of the latest stations under construction or projected, that is, one large boiler per turbine.

Aside from a new steam generator, incorporating water-cooled furnace walls and floor or ash screen, as an integral part of the boiler circulatory system, and the installation of the largest single-pass boiler in the world at the Duluth plant of the Minnesota Power and Light Company, the year just ended saw little new in boiler design. Fusion welding continued to gain in favor and there was a trend toward larger air preheaters.

Tests on two of the largest boilers in existence at the Hell Gate Station in New York showed an over-all efficiency of 88 per cent while generating over a million pounds of steam per hour in each unit. These boilers are fired with pulverized coal and have slag-tap furnaces.

The feedwater problem continued to occupy the attention of research laboratories. At the New Brunswick Experiment Station of the United States Bureau of Mines investigations were made on "Solubility of Sodium Sulphate in Boiler Water Salines as Related to Prevention of Embrittlement" and at the University of Michigan studies were conducted on "Determination of Dissolved Oxygen in Boiler Feedwater." Also, at the Naval Experiment Station, Annapolis, after extensive experiments, a new form of feedwater treatment was evolved for Naval boilers.

Other research included "Studies on the Removal of Ash as Molten Slag from Pulverized-Coal Furnaces" and "The Effect of Preheated Air on Fuel Beds" at the Pittsburgh Station of the United States Bureau of Mines; "The Burning Characteristics of Pulverized Fuels and Radiation from their Flames," at Battelle Memorial Institute, Columbus, O.; Smoke Abatement research at Stevens Institute of Technology, Hoboken, N. J.; and several independent investigations on the Grindability of Coal, Related to the boiler field, as well as that of turbines and piping, was the research on "Creep of Metals at High Temperatures," conducted jointly by the American Society of Mechanical Engineers and the American Society of Testing Materials. Several manufacturers also conducted investigations in this line.

In the field of fuel-burning equipment, new designs of small and medium-sized stokers of the underfeed type have been brought out to handle low-grade coals, and large stokers have been redesigned to use higher air preheat and zoned control of combustion air. After some modifications, the world's largest stokers at the Hudson Avenue Station in Brooklyn, N. Y., successfully

met the guaranteed steam output from their respective boilers of 530,000 pounds of steam per hour. In pulverized-coal firing the capacity of mills has been increased and one station has adopted the practice of using one pulverizer per burner. Pulverizers are also being improved to lessen maintenance and to reduce their power consumption. Preheat temperatures with pulverized coal and with oil increased to a maximum of 600° F., whereas with stokers 500° F. has been employed successfully, although 350 to 400° is the more common.

During the year many plants changed over from coal to oil or gas firing because of favorable oil and gas prices. With the NRA Codes now applicable to all fuel industries it is possible that the present year may see a change in the competitive fuel situation.

Because of the depression, with some factories shut down and a curtailment of certain forms of expenditure on the part of municipalities, enforcement of smoke-abatement ordinances was allowed to lag in a number of localities. In England, however, the movement was carried forward to the end that practically all the new power stations have been equipped with smoke and cinder, or fly-ash, arresting devices and some are removing the sulphur fumes from the stack gases.

Early in January the United States Department of Commerce released figures on the production of steel boilers for the first eleven months of 1933. The total number, including power, heating and marine boilers, was 3787 compared with 3437 for the same months of 1932. The corresponding heating surface sold was 4,508,194 and 3,344,870 sq. ft., respectively. Of the 3787 steel boilers built in 1933, 2101 were for heating, 1506 for power service and 180 for marine use. From the same source and for the same period, the number of stokers for power boilers is given as 1422 in 1933 and 1189 in 1932; and the number of coal pulverizers as 141 and 88, respectively. These figures indicate a substantial increase in boilers and fuel-burning equipment for 1933 as compared with 1932.

BOLIVIA. A landlocked Andean republic of South America. Capital and largest city, La Paz; seat of the Supreme Court, Sucre.

AREA AND POPULATION. The area of Bolivia is uncertain, due to the unsettled boundary dispute with Paraguay. Exclusive of the Chaco territory under dispute, the area is estimated by one official source at 506,467 square miles; including the Chaco, 626,517 square miles. The population on Jan. 1, 1932, was estimated at 3,014,069, with Indians constituting about 57 per cent of the population, mestizos 30 per cent, and whites 13 per cent. The educated classes speak Spanish; the natives, Quechua and Aymara. La Paz on Dec. 31, 1932, had 150,898 inhabitants (142,549 in 1928), including 60,094 whites, 47,245 mestizos, and 41,077 Indians. The estimated population of the other towns in 1932 was: Cochabamba, 49,612; Potosí, 36,348; Sucre, 26,439; and Santa Cruz, 31,691.

EDUCATION. Elementary education by the municipalities and the state is nominally free and compulsory, but the native and mestizo classes are largely illiterate. In 1932, there were 2033 primary schools, with 143,017 pupils, and 39 secondary schools (19 national), with a total of 4402 students. There were 22 special schools, with 2033 students and 18 institutions offering university instruction, with 1745 students. The Uni-

versities of La Paz and Sucre are the principal institutions of higher education.

PRODUCTION. The bulk of the native population exists by primitive agriculture. Mining, and particularly the production of tin, is the only important industry. Bolivia normally supplies about one-fourth of the world's tin requirements and the economic condition of the country is determined largely by the prevailing world prices and demand for tin. After some six years of declining tin prices, which plunged Bolivia into the depths of economic depression, the government on June 1, 1932, signed an agreement with other tin-producing countries restricting production. The Bolivian output was fixed at 14,087 tons annually during 1932 and 1933. The metal content of tin ore exported in 1932 was 20,918 metric tons, valued at 37,122,307 bolivianos (1 boliviano, equal to \$0.365 at par, exchanged at \$0.2122 in 1932). This compared with exports of 31,600 tons, valued at 48,386,220 bolivianos in 1931. Most of the ore was shipped to Great Britain for refining. A rise in tin prices was noted in 1933. Exports of other leading minerals in 1932 were: Zinc, 12,968 metric tons valued at 2,292,372 bolivianos; silver, 128 metric tons worth 3,312,468 bolivianos; copper, 2017 tons valued at 758,774 bolivianos; lead, 5488 tons valued at 661,742 bolivianos; antimony, 1469 tons valued at 459,364 bolivianos; wolfram, bismuth, gold, etc. Petroleum output was 44,000 barrels. Total mineral exports were valued at 44,884,462 bolivianos. The chief crops are potatoes, cacao, coffee, corn, highland rice, and rubber. Some 6,500,000 acres were under cultivation in 1931.

COMMERCE. Due to the outbreak of war with Paraguay in 1932, few statistics for 1932 or 1933 were available. Imports in 1932 were estimated at 20,000,000 bolivianos and exports at 47,500,000 bolivianos, compared with 1931 imports and exports of 29,821,000 and 60,014,000 bolivianos, respectively. Minerals are the chief exports, while sugar, flour, coal, iron, and steel products, machinery, textiles, and apparel are normally the leading imports. In 1932 and 1933, arms and ammunition and other war supplies were imported in large quantities. United States trade statistics showed exports to Bolivia of \$2,160,000 in 1932 (\$1,775,000 in 1931) and imports from Bolivia of \$6000 (\$43,000 in 1931). However, many products destined for or exported from Bolivia were credited to Chile and other neighboring countries through which goods were transhipped. Exports to the United Kingdom (mostly tin) in 1932 were £1,879,573; imports from the United Kingdom, £194,218.

FINANCE. The financial condition of the government became rapidly worse following the outbreak of the undeclared war with Paraguay in June, 1932. The budget for 1932, as revised in June of that year, estimated revenues at 27,355,826 bolivianos and expenditures at 43,957,991 bolivianos. The real deficit was much larger than the estimated deficit of 16,602,165 bolivianos, collections for the first 10 months of the year being some 9,000,000 bolivianos under estimated receipts. The 1933 budget, decreed early in the year by the President, provided for expenditures of 21,050,000 bolivianos, excluding the ordinary and extraordinary expenses of the War Department. Ordinary revenues for 1933 were expected to total less than 17,000,000 bolivianos. The deficits were met in part by heavy borrowing from the Central Bank and other large domestic loans.

On Oct. 31, 1932, the public debt amounted to 242,433,180 bolivianos, of which 172,179,105 represented external indebtedness, 26,958,719 internal funded indebtedness, and 42,695,355 internal floating debts. Service on the public debt was suspended indefinitely in 1931. In these figures the external debt is given in bolivianos at par value. The total would be considerably greater if stated in bolivianos at the current exchange value. The public debt at the end of May, 1933, was reported by the Central Bank at 299,652,536 bolivianos.

COMMUNICATIONS. Railways in operation in Bolivia in 1932 had about 1384 miles of line. There were about 1360 miles of permanent highways (excluding some 1166 miles passable only part of the year). A network of airlines operated by the Lloyd Aereo Boliviano connected the principal cities. A steamer service was in operation on Lake Titicaca.

GOVERNMENT. The Constitution of 1880 vests executive power in a President, elected for four years by direct popular vote and ineligible for reelection. One vice president is similarly elected. There is a Congress of two chambers, the Senate of 16 members elected for six years, and the Chamber of Deputies of 72 members elected for four years. One-third of the Senate and one-half of the Chamber retire every two years. The President selects a Cabinet of six members, which is responsible to Congress. President in 1933, Dr. Daniel Salamanca, who assumed office Mar. 5, 1931.

HISTORY

THE CHACO WAR. The war between Bolivia and Paraguay for possession of the Chaco Boreal continued throughout 1933. (For background of the dispute, see 1932 and previous YEAR BOOKS.) Unceasing efforts by the Commission of Neutrals at Washington, the ABCP group (Argentina, Brazil, Chile, and Peru), the League of Nations, and many of the individual American republics were all unsuccessful in terminating hostilities. By the end of 1933, the bloody struggle had been in progress for a year and a half, on a scale unprecedented for South American warfare.

Fighting and disease were conservatively estimated to have caused more than 30,000 deaths, while the number rendered ineffective through wounds and disease was placed at 50,000 or more. The task of maintaining their armies in the field was exhausting the slender economic resources of both countries and their public debts, already in default in the case of Bolivia, were rapidly increasing (see BOLIVIA and PARAGUAY under Finance).

The Peace Negotiations. Having rejected the peace formula submitted to both Bolivia and Paraguay on Dec. 15, 1932, by the Commission of Neutrals (United States, Cuba, Mexico, Colombia, and Uruguay) sitting at Washington, Paraguay withdrew its representative before the Commission on Dec. 31, 1932. The Commission of Neutrals immediately cabled the governments of Argentina, Brazil, Chile, and Peru, asking them to suggest ways of ending the Chaco war. The Chilean reply was the only one to contain a concrete proposal. After preliminary explorations, the Chilean and Argentine Foreign Ministers met at Mendoza, Argentina, Feb. 1 and 2, 1933, and drafted a peace formula. This was approved by Brazil and Peru and then submitted to the disputants on February 25. Meanwhile the Com-

mission of Neutrals withdrew, leaving the field clear for the ABCP mediation effort.

The Mendoza formula provided for the withdrawal of both Bolivian and Paraguayan troops a given distance from the battle front pending a decision of the fundamental question by arbitration. Previous arbitration proposals had failed because of the impossibility of agreeing upon the zone to be arbitrated. To avoid this pitfall, the formula provided that any such differences between the two disputants would be submitted to the World Court. Both Bolivia and Paraguay accepted the Mendoza formula "in principle" but hedged their acceptance with conditions. Paraguay was finally induced to withdraw its reservations, but Bolivia refused to accept the formula unless a previous agreement was reached upon the exact territory to be arbitrated. In response to appeals from Argentina and Chile, the La Paz Foreign Office emphatically protested against attempts to "impose" a peace settlement by "diplomatic pressure."

Irritated at Bolivia's action, the Argentine and Chilean governments now withdrew from the negotiations. On May 5 Bolivia requested the Commission of Neutrals and the ABCP countries to continue their mediatory efforts. The Commission of Neutrals on May 9 called a meeting in Washington to consider joint action with the ABCP group on the Bolivian suggestion, but the representatives of Argentina and Chile declined the invitation to attend. The next day (May 10) Paraguay formally declared that a state of war existed with Bolivia, a move which reinforced the jurisdiction of the League of Nations in the dispute. Accordingly the Commission of Neutrals and the ABCP group allowed the League to assume sole direction of the peace efforts.

The League on January 27 had suggested directly to Bolivia and Paraguay that a League commission of inquiry be sent to the Chaco, but both countries withheld their consent pending the outcome of the ABCP negotiations. On March 2 the League Council, on motion of Great Britain and France, proposed a world-wide arms embargo on Bolivia and Paraguay, but this action was frustrated, chiefly through the refusal of the United States Congress to authorize the President to declare an embargo.

A League formula for settlement of the dispute was submitted to the belligerents at a public session of the Council on May 20. It provided for cessation of hostilities, withdrawal of the declaration that a state of war existed, an inquiry on the spot by a League commission, and arbitration. Paraguay immediately accepted this proposal without reservations. Bolivia, in a note of May 27, accepted on condition that peace was not imposed but negotiated freely and that a definite arbitration agreement be agreed upon before an armistice was declared. The note declared that it was desirable for the Commission of Neutrals to continue its efforts. These reservations led to protracted League negotiations which ended on July 26, when Bolivia and Paraguay, at the instance of the Brazilian Foreign Office, unexpectedly requested the League to transfer its jurisdiction over the dispute to the ABCP group. The League, which had on July 19 appointed a commission of inquiry to report on the dispute, reluctantly consented.

Brazil played the leading rôle in the new ABCP peace parleys, but with no better success. After two months of negotiation, accompanied by often

contradictory reports of new peace formulas and by much criticism in the South American press, the Brazilian Foreign Minister formally notified the League on September 30 that the ABCP efforts again had failed. The League of Nations now took up the task of conciliating the belligerents once more.

The League's commission of inquiry arrived in Asunción, Paraguay, November 18 to commence its study of the problem. It consisted of Julio Alvarez del Vayo (Spain), chairman; General Freydenberg (France), General Robertson (Great Britain), Count Aldovradio (Italy), and Col. Rivera Flandes (Mexico). The military members visited the Paraguayan front. On December 8 the commission arrived in La Paz for a similar study of the Bolivian side of the dispute. Meanwhile the seventh Pan-American Conference (q.v.) had convened in Montevideo, Uruguay, and brought added pressure to bear for a cessation of hostilities. As a result of the efforts of President Terra of Uruguay, Secretary Hull of the United States, and other delegates to the conference, a truce was arranged between Bolivia and Paraguay. Originally extending from midnight, December 19, to December 30, the truce was later extended to midnight on Jan. 8, 1934. The League commission returned to Montevideo December 25 and took charge of the negotiations for a permanent termination of hostilities.

Military Developments. While the various peace agencies were striving to end the conflict, the armed struggle in the Chaco continued under arduous and discouraging conditions. The Bolivian counter-offensive, commenced Dec. 10, 1932, continued with considerable success during the first half of 1933. The Bolivian drive was directed by General Kundt, the Commander-in-Chief, at the Paraguayan Fort Nanawa (Ayala), the nerve centre of the Paraguayan defense system. In Bolivian hands, it would have opened the way for a Bolivian advance to the Paraguay River.

The Bolivians gained important victories in the capture of Fort Alihuata (March 12) and of Campo Jordán (Kilometer Seven) on March 18. These advances enabled them to invest Nanawa more closely and a series of savage attacks and counter-attacks followed in a desperate struggle for this key position. The Paraguayan defenders clung to the fort with grim determination against which the Bolivian offensive finally wore itself out. Their army reduced by casualties and sickness, the Bolivians called out additional reserves from classes of men 32, 33, and 34 years old. The Paraguayans, aided by some newly arrived airplanes, improved their positions. Another Bolivian offensive, launched against Nanawa with some 25,000 troops on July 6, was repulsed after heavy fighting. The Paraguayans, under Colonel Estigarribia, followed up their advantage and drove the Bolivians back at several points.

Heavy fighting continued, with occasional lulls, until the truce of December 19. The severe heat and drought of the summer favored the Paraguayans, whose lines could be more easily supplied with water. The action of the Argentine government in closing its frontier to Bolivian traffic further handicapped the Bolivians, who were thus cut off from a convenient source of supplies. During October and November, the Paraguayan communiqués reported important advances.

Early in December the progress of the Paraguayan military plan for bringing the war to a conclusion was aided by heavy rains, which flooded

large areas in the rear of the Bolivians and hindered troop movements. The Paraguayans seized the opportunity to launch smashing blows at the Bolivian defenses in the Gondra-Alihuata sector. With the fall of Fort Alihuata on December 10, the Paraguayans were able to roll up the Bolivian lines to the south, taking thousands of prisoners and capturing with little difficulty key positions which had resisted the Paraguayan offensive a year earlier. Fort Samaklay (Agua Rica) fell on December 12, Forts Murguia and Saavedra on December 13, Fort Cuatro Vientos December 14, and on or about December 19 the important Forts Muñoz—Bolivian headquarters in the Chaco,—Sorpresa, and Corrales. (The Bolivians charged that these latter forts were captured after midnight on December 19, when the truce became effective.)

These sweeping Paraguayan victories were estimated to have cost Bolivia two-thirds of her army in the field. Paraguayan estimates placed the Bolivian dead, wounded and prisoners for the month ended December 19 at from 10,000 to 15,000. It was reported that only the Seventh Division of some 5000 troops and scattered remnants of two other Bolivian divisions remained to oppose a further Paraguayan advance. Gen. Hans Kundt, the Bolivian commander-in-chief, was replaced about December 14 by Col. Enrique Peñaranda.

OTHER FOREIGN RELATIONS. The declaration by Paraguay that a state of war existed was primarily designed to force neighboring countries to declare their neutrality. It was believed in Asunción that the neutral countries would forbid shipments of arms and other war supplies through their territory, thus isolating Bolivia, which was forced to import all war materials through Chile, Peru, or Argentina. Paraguay, on the other hand, could not be prevented from importing war material by the international Paraguay River. Argentina, Uruguay, and Chile declared their neutrality on May 13, Peru on May 14, and Brazil on May 25. Chile and Peru offered no objection to the continuance of Bolivian war imports, however. Argentina, after some delay, closed its frontier with Bolivia along the Pilcomayo River, shutting off large imports of food supplies, war materials, and apparel. This action aroused much hostility toward Argentina in Bolivia. Argentina protested the Bolivian aerial bombardment of the Paraguayan town of Puerto Casado, in which the property of an Argentine citizen was damaged. The claim for damages was refused by La Paz authorities, who offered to submit the matter to the World Court.

INTERNAL CONDITIONS. The strain upon Bolivian finances and economic resources of the Chaco war, as well as the heavy losses in killed and wounded, aroused a demand for peace in some circles. President Salamanca, in his address at the convening of Congress on August 6, defended the government's policy and urged the continuance of the struggle "for the very existence of Bolivia, its full sovereignty, its dignity as a nation, its honor." An increasing shortage of foreign exchange developed during the year, hindering the purchase of necessary supplies abroad. In the middle of September, 1933, exchange was available to cover only the July allocations of the exchange control board. Beginning in December, 1932, the government ordered the banks, as well as certain foreign mining com-

panies operating in Bolivia, to turn over to it specified amounts of their gold and foreign-exchange holdings in return for bolivianos at the current exchange rate.

A cabinet crisis involving the conduct of the war and of Bolivia's foreign relations came to a head with the resignation on November 15 of Foreign Minister Demetrio Canelas. Negotiations for the formation of a coalition cabinet of national defense were started immediately but it was not until December 1 that the new ministry was formed, the former cabinet resigning the same day. The new government was headed by Dr. Carlos Calvo (Liberal), who assumed charge of the Foreign Office also. Other members were: Government and Justice, Rafael de Ugarte; Finance and Industry, Joaquín Espada; National Defense, Zacarias Benavides; War and Colonization, Juan Antonio Quiroga; Public Works and Communications, José Salinas; Public Instruction and Agriculture, Juan Manuel Sainz.

Gen. Ismael Montes, twice President of Bolivia, died Nov. 18, 1933, and Dr. Daniel Sánchez de Bustamante, noted Bolivian jurist and statesman, died Aug. 5, 1933. See their biographies.

BONFILS, FREDERICK G. An American journalist and publisher, died in Denver, Colo., Feb. 2, 1933. He was born at Troy, Mo., Dec. 21, 1860, and entered the United States Military Academy in 1878, resigning in 1881. Returning to the West, he joined the Oklahoma land rush in 1889 and was active in the development of that territory, particularly Guthrie and Oklahoma City. Later he moved to Kansas City and was associated with a lottery company. He disposed of his interests upon the enactment of the Federal anti-lottery law in 1890 and went to Denver. There he met Harry H. Tammen, a bartender and publisher of a small weekly newspaper called the *Great Divide*. The two men bought the *Denver Post* and began a career of journalistic crusading that brought them and their newspaper into great prominence. Above the door of the *Post* building was carved the inscription, "O, Justice, when expelled from other habitations, make this thy dwelling place."

The rigorous search for truth which actuated Bonfils and Tammen kept them in constant turmoil. Both were shot by an irate lawyer in 1899, and they were frequently involved in legal suits. Tammen died in 1924, at a time when the *Post* was active in uncovering the Teapot Dome scandal, and left a fortune of \$6,000,000 to charity. In 1904 the partners bought the Sells-Floto Circus and continued its ownership until 1921. In 1909 they bought the *Kansas City Post*, reselling it in 1922. Bonfils maintained the direction of the *Denver Post* until a few days before his death. He was one of the last survivors of the period of personal journalism.

BOSTON UNIVERSITY. A nonsectarian institution of higher education in Boston, Mass., founded in 1869. The enrollment for the autumn session of 1933 was 8950, distributed as follows: College of Liberal Arts, 537; College and Extension Courses, 308; College of Business Administration, 2739; College of Practical Arts and Letters, 564; College of Music, 139; School of Theology, 243; School of Law, 463; School of Medicine, 249; School of Education, 1964; School of Religious Education and Social Service, 93; Graduate School, 474. The enrollment for the 1933 Summer Session was 1163. The faculty numbered 529. The endowment amounted to \$4,338,383. In the libraries of the University there were more than 150,000 volumes. President, Daniel L. Marsh, Ph.D., Litt.D., L.H.D., LL.D.

BOTANY. It is significant of modern scientific tendencies that taxonomy, less than half a century ago the leading department of botany, now attracts but a minor proportion of students. Interest during the past year has been largely centered in genetics, although physiology also received much attention. As in previous issues of the YEAR BOOK, the subject is discussed under appropriate headings.

GENETICS. Undoubtedly the researches of Prof. A. F. Blakeslee and his associates on the cytology of the jimson weed (*Datura*) are of paramount scientific as well as economic importance. In the case of this plant he has discovered a method of synthesizing pure breeding types with distinctive characters (*Proc. Nat. Acad. Sci.* 19: 115-122, 1933). Evidently, therefore, it will be possible with further investigation to synthesize a considerable number of pure breeding types with different kinds of extra chromosomal material, and accordingly with different external characters. The value of such knowledge to both plant and animal breeders is apparent.

In addition to clarifying our understanding of heredity, the study of chromosomes has revolutionized earlier concepts of cytology. Many investigators have prosecuted this study with vigor. Thus George M. Darrow and A. E. Longley (*Journ. Agric. Research* 47: 315-330, 1933) examined the chromosomes of the wild trailing blackberries of the Pacific Coast with reference to the origin of cultivated varieties, especially the Logan. A. E. Longley (*loc. cit.* 217-228) studied the chromosomes of the cotton plant (*Gossypium*) and related genera, and Thomas H. Goodspeed (*Proc. Nat. Acad. Sci.* 19: 649-652, 1933) those of tobacco (*Nicotiana*), of which, as a result, he recognizes 40 species. Prof. H. Ruggles Gates (*Am. Nat.* 67: 352-364, 1933), discussing the general bearing of recent research in the evening primrose (*Oenothera*) pointed out that this genus afforded the starting point for much modern work on mutational changes in chromosome numbers, catenation, and the vast subject of polyploidy. In this connection J. Theron Illick (*Bot. Gaz.* 94: 1-50, 1933) made a study of the chromosomal configuration of *Oenothera* species and crosses and their probable significance. D. T. Killough and W. R. Horlacher (*Genetics* 18: 329-334, 1933) discussed the inheritance of virescent yellow and red plant colors in cotton. E. W. Lindstrom (*Journ. Hered.* 24: 129-138, 1933) described 6 heritable recessive variants in the tomato induced by radium treatment. M. Demerec (*Journ. Hered.* 24: 369-378, 1933) gave

an explanation of the gene and commented upon the discoveries which have increased our knowledge of it. He visualized the gene as a single organic molecule possessing the power of self-propagation, these molecules being held together in the form of a string by some unknown force.

PHYSIOLOGY. A large proportion of research in this department of botany was devoted to phytochemistry. Norwood C. Thornton (*Contr. Boyce-Thompson Inst.* 5: 371-418. 1933) tested the influence of carbon dioxide on oxygen uptake and on the acidity of plant tissues. Experiments were conducted with various concentrations of CO₂ and with various lengths of storage periods. He found that the rate of uptake was increased by high percentages of CO₂ in the case of potatoes, onions, beets, and tulips, but was decreased in asparagus and lima beans. As to acidity, it was found that the treatment of various types of plant tissues resulted in a decided decrease in the hydrogen ion concentration of the extracted sap. Zimmerman, Crocker, and Hitchcock (*loc. cit.* 195-212) proved that carbon dioxide in general causes growth vigor and loss of sensitiveness to external stimuli, as shown by retardation of stem elongation, small size of new leaves, abnormal yellowing, etc. On the other hand (*loc. cit.* 1-18) they found that the gas induced definite rooting responses in 27 species of plants. Experiments conducted by Aual Hester Brown (*Bot. Gaz.* 94: 755-770. 1933) on the action of sulphuric acid in delinting cotton seeds before planting showed that in 6 varieties tested there was a higher percentage as well as an increased rate of germination. Lloyd B. Wilson (*Journ. Agric. Research* 46: 889-900. 1933), examining the effects of haloids upon tobacco, found that they cause the leaves to become thickened by enlargements of the cells, which is correlated with increased osmotic concentration. Albert Saeger (*Am. Journ. Bot.* 20: 234-245. 1933) discovered that manganese is essential for the growth of five species of Lemna, as growth ceases when this element is absent. A supply of .001 mg. per liter proved sufficient to maintain vigorous growth.

Paul J. Kramer (*Am. Journ. Bot.* 20: 481-491. 1933) demonstrated that water absorption is not stopped by death of the roots, as considerable quantities are absorbed through dead root systems, while transpiration is rapidly decreased. Whitaker and Chester (*Am. Journ. Bot.* 20: 297-308. 1933) tested 75 graft combinations for representatives of 10 genera and 24 species of Solanaceae for the presence of acquired precipitins after grafting. Not a single case was discovered in which the reaction was approximately greater, and there is accordingly no indication that there is any acquired immunity of stock to cion or of cion to stock demonstrable by the precipitin method. A. F. Camp, Harold Mowry and K. W. Loucks (*Am. Journ. Bot.* 20: 348-357. 1933) detected considerable variation in the effects of soil temperature on the germination of citrus seeds. The minimum was below 15° C., the maximum a little below 40° C., and the optimum between 31° and 35° C. Kenneth V. Thimann and Folke Skoog (*Proc. Nat. Acad. Sci.* 19: 714-716. 1933) continued their studies on the growth hormone of plants and its inhibiting action on bud development. Ferdinand W. Haasis (*Am. Journ. Bot.* 20: 85-91. 1933), experimenting with the dendrograph upon the Monterey pine, showed that fluctuations in stem diameter may occur, one

part of the bole increasing by growth while another is shrinking.

Research was continued upon the physiological variations following seed exposure to high voltage X-rays. Charles A. Shull and John W. Mitchell (*Plant Physiol.* 8: 287-296. 1933) showed by experimentation on wheat, corn, oats, and sunflower seedlings that X-rays tend to stimulate plant growth. H. W. Popp and Florence Brown (*Bull. Torr. Bot. Club* 60: 161-210. 1933) reviewed recent work upon the effects of ultra-violet radiation upon seed plants.

ECOLOGY. R. E. Moreau (*Journ. Ecol.* 21: 415-435. 1933) discussed the climatic changes and distribution of life in East Africa, stating that in the Kamasian epoch, some 400,000 years ago, communication existed between the present forest islands of this region and the West African forest. As recently as 22,000 years ago montane forest species were dominant throughout the East African interior, and it is only within this period that isolation favorable to race differentiation has developed. The author considers that an increase of 15 to 20 inches in rainfall would be sufficient to cover all the continent with forest. Clare Francis Cox (*Ecol. Monog.* 3: 301-372. 1933), with reference to alpine plant succession on James Peak, Colo., pointed out that the alpine flora consists (1) of alpine species which have probably originated in the Rocky Mountains; (2) of disjunct species, some of which originated in the Arctic and others in high mountains of Europe or Asia, and (3) of species the centre of origin of which is doubtful on account of their continuous range. A similar study on the ecology of the vegetation of the Pike's Peak region was conducted by C. J. Whitfield (*Ecol. Monog.* 3: 75-106. 1933).

L. Cockayne (*Am. Journ. Bot.* 20: 545-551. 1933) described an interesting example of epharmony in a New Zealand blackberry (*Rubus cissoides*), in which plants exposed to sunshine or dry ground produce leaves only of midrib form and do not flower, while those in the forest develop laminate leaves and flower freely. L. J. Pessin (*Ecology* 14: 1-14. 1933), investigating the forest associations in the uplands of the lower Gulf coastal plain region, found them, as might be expected, determined largely by prevailing edaphic conditions. The cypress-gum association is generally regarded as climax vegetation. R. W. Butcher (*Journ. Ecol.* 21: 58-91. 1933) found in connection with the ecology of river vegetation that the chief factor governing the distribution of macrophytes in running water is the current, which exerts a mechanical strain and also determines the nature of the river bed. According to P. S. Gupta (*Journ. Ecol.* 21: 452-474. 1933) cultural experiments with beans and oats prove that denser soils produce smaller and stronger root systems but have little effect with regard to extent of growth of tops and assimilating surface.

G. Fenzel (*Lignan Journ. Sci.* 12: 11. 1933) gave an account of the little known vegetation of Manchuria.

PATHOLOGY, MYCOLOGY. It is of interest to note that at the twenty-fourth annual meeting of the American Phytopathological Society held at Atlantic City, Dec. 28, 1932, 10 new or little known plant diseases were reported affecting flowers and fruits in various parts of the United States.

L. K. Henry (*Bot. Gaz.* 94: 791. 1933), from an examination of the trees and shrubs of But-

ler County, Pa., found 60 species with mycorrhiza, 26 of which were additional records. Endotrophic and ectotrophic types frequently occurred on the same plant. Investigations by H. H. Flor (*Journ. Agric. Research* 47: 193-214. 1933) and W. K. Smith (*loc. cit.* 89-106) showed that one of the major contributing factors in the prevalence of bunt or stinking smut, the most important disease of wheat in the Pacific Northwest, has been the appearance of new physiologic forms of the fungus. E. C. Tullis (*Journ. Agric. Research* 46: 779-806. 1933) found that a disease infesting the rice growing section of eastern Arkansas is caused by *Ophiobolus oryzae*, discovered originally in the Philippines. The rot disease of rice seeds and seedlings has been a serious problem in the Orient. Experiments were conducted by Ito and Nagai (*Journ. Agric. Hokkaido Imp. Univ.* 32: 201-228. 1933) on this disease, which is caused by several species of *Pythium* and by various saprolegniaceous fungi.

Many students continued work on the mosaic diseases of tobacco and other plants. In view of the prevalence of mosaic disease of dahlias throughout the East, this and other dahlia diseases were investigated by Philip Brierley (*Contr. Boyce-Thompson Inst.* 5: 235-288. 1933), who suggested that control might be effected by selection and by isolation of healthy plants. W. R. Tascher (*Journ. Agric. Research* 46: 909-916. 1933), experimenting on the control of seed-borne diseases by X-rays found the results scarcely conclusive and requiring further research. G. R. Bisby (*Am. Journ. Bot.* 20: 246-253. 1933) contributed some observations on the distribution of fungi. Although in our present state of knowledge the phanerogams outnumber the fungi by almost two to one, it is probable that the fungi are actually far more numerous. Saprophytes are in general more widely distributed than parasites.

Spread of the Dutch elm disease, caused by the fungus *Ceratostomella ulmi* (*Graphium ulmi* in the conidial stage), has been a serious problem occupying the attention of government pathologists.

TAXONOMY. Revisions of various groups of plants were published during the year. H. A. Gleason (*Brittonia* 1: 127-184. 1933) presented a synopsis of the Melastomataceae of British Guiana; Lily M. Perry (*Ann. Missouri Bot. Gard.* 30: 239-362. 1933) revised the North American species of *Verbena*; Carroll W. Dodge (*loc. cit.* 373-467) the lichens of Costa Rica; and E. B. Copeland (*Philippine Journ. Sci.* 51: No. 2. 1933) the Old World species of *Trichomanes*. Josephine E. Tilden (*Bot. Gaz.* 95: 59-77. 1933) offered a classification of the algae based on evolutionary development with special reference to pigmentation. Dr. I. V. Newman (*Journ. Linn. Soc. London* 49: 133-172. 1933) began a comprehensive study of the Australian acacias based on features of the inflorescence rather than on foliar or other vegetative characters, the aim being to formulate a phylogenetic classification.

BIBLIOGRAPHY. Among the numerous books issued during the year relating to various branches of botany the following may be noted: *Recent Advances in Agricultural Plant Breeding*. By H. Hunter and H. Martin Leake. P. Blakiston's Son & Co.; *Plant Sociology*. By J. Braun-Blanquet, translated and revised by George D. Fuller and Henry S. Conrad. McGraw-Hill Co.; *Recent Advances in Cytology*. By C. BOUNDARY DISPUTES. See BOLIVIA, COLOMBIA, PERU, GUATEMALA, under *History*.

BOWDOIN COLLEGE. An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment of the autumn session of 1933 was 580. There were 53 faculty members. The productive funds of the college amounted to \$6,441,195, and the income for 1932-33 was \$404,190. There were more than 160,000 volumes in the library. President, Kenneth Charles Morton Sills, LL.D.

BOWKER, bou'kér, RICHARD ROGERS. An American editor, author, and publisher, died near Stockbridge, Mass., Nov. 12, 1933. He was born in Salem, Mass., Sept. 4, 1848. On his graduation from the College of the City of New York in 1868 he became literary editor of the *New York Evening Mail* and in 1875 accepted a similar position with the *New York Tribune*. The following year, with Melvil Dewey and Frederick Leyboldt, he founded the American Library Association and after that date was editor of the *Library Journal*. He became a contributor to the *Publishers' Weekly* about the same time and after the death of Mr. Leyboldt in 1884 also edited that periodical. During 1880-82 he was British representative of Harper and Bros., starting in London an English edition of *Harper's Magazine*. He entered the industrial field in 1890, serving until 1899 as first vice-president of the Edison Electric Illuminating Co. of New York (later the New York Edison Co.). He was also vice-president for about a score of years after 1901 of the DeLaval Turbine Co. and from 1902 to 1931 of the DeLaval Separator Co. In 1911 the R. R. Bowker Co. was incorporated as publishers of the *Library Journal*, *Publishers' Weekly*, and other periodicals, books, and material of interest to librarians and booksellers.

During the latter part of the nineteenth century Mr. Bowker gained considerable prominence as a political agitator. The Independent Republican or "Mugwump" movement which he started in 1879 originated as a protest against the methods of the political machine controlled by Roscoe Conkling in forcing the Republican candidacy and consequent election of Alonzo B. Cornell as Governor of New York. At the Republican National Convention of 1880 the Independent faction played a large part in thwarting the efforts of Conkling to secure Grant's nomination for a third term in the presidency. Four years later its adherents, mostly from New York, Connecticut, and Massachusetts, refused to ratify the nomination of James G. Blaine for president on account of alleged political and personal dishonesty and in the ensuing election cast their

ballots for Grover Cleveland, the Democratic candidate. In 1896 the movement became affiliated with the National Democratic party, which favored adherence to the gold standard in opposition to the demand of the regular Democratic party for the free coinage of silver at the ratio of 16 to 1.

Mr. Bowker served for many years as a member of the council of the American Library Association and in 1926 was named its honorary president. From 1884 to 1910 he edited the *Annual American Catalogue* and from 1892 to 1904 the *Annual Literary Index*. He was also active in the copyright movement, serving as vice-president of the American Copyright League, championing the cause of an international copyright, and publishing *Copyright, Its Law and Its Literature* (with Thorvald Solberg, 1886) and *Copyright, Its History and Its Law* (1912). After founding the Society for Political Education in 1880, he became active in the Civil Service Reform Association and was instrumental in procuring the passage in 1883 of the first civil service reform bill in the New York Legislature. He was also one of the early advocates of the Australian ballot, publishing in 1889 *Electoral Reform*. In 1930, with Norman H. Davis, he initiated the Council for Tariff Reduction, a successor to the American Free Trade League of which he had served for many years as honorary secretary. Among his other publications were: *Of Work and Wealth* (1883); *Economics for the People* (1886); *The Arts of Life* (1900); *Problems of the Infinitely Little* (1910); *Economic Peace* (1923); and *From Years That Are Past* (verse, 1923).

BOWLING. Gil Zunker of Milwaukee topped the 1933 American Bowling Congress field of almost 5000 bowlers in the thirty-third annual tournament at Columbus, O., winning two championships. He succeeded Hughie Stewart of Cincinnati as all-events champion with an average of 228.8 for nine games and paired with Frank Benkovic to take the doubles crown, with a new all-time high of 1415 pins. Benkovic had won in 1932 paired with Charley Daw with 1385. Earl Hewitt of Erie, Pa., won the singles title with 724; and the team honors went to Flagg's Opticians of Covington, Ky., with 3021 pins.

In an eighty-game match for the national match play title at Chicago, Joseph Miller of Buffalo defeated Stewart Watson of Chicago, 16,660 to 15,191.

Women bowlers were also active, Miss Sally Twyford, of Aurora, Ill., winning the women's all-events with 1765 and the singles with 628.

BOXING. Primo Carnera's rise to the heavyweight championship of the world was the highlight of the 1933 boxing season. The mastodonic Italian, who had toured the world for three years, knocking over set-ups and becoming tainted with suspicion, turned on Jack Sharkey, defending champion, in the Madison Square Garden Bowl, Long Island City, in June and stopped him in the sixth round with a series of right swings and pushes. Carnera appeared a greatly improved pugilist in many ways, stepping around the ring in almost approved fashion and shooting his blows with precision and a certain amount of cleverness. As Carnera became champion, his reputation was a bit tarnished by other boxing events of the year. Two weeks before he defeated Sharkey, Max Baer, Livermore, California heavyweight, who had slowly improved over a stretch of three years,

knocked out Max Schmeling, German, who lost the heavyweight title to Sharkey in 1932. Thus Baer became the hero of the boxing world, through the despatch and manner of his triumph over the German. He displayed a lethal blow and an attitude of cheerfulness that endeared him to fans who still waited for "another Dempsey." Incidentally the Baer-Schmeling fight, which was held at the Yankee Stadium in New York City and promoted by Jack Dempsey, drew the largest fight crowd of the year in the United States. More than 50,000 persons watched Baer in action as against 31,000 who sat in on Carnera's victory over Sharkey. Baer cast Carnera into a shadow and the Italian's championship was further belittled later in the year when Sharkey, attempting a comeback, succumbed to King Levinsky in Chicago and then lost to Tommy Loughran in Philadelphia. Three years before Sharkey had disposed of Loughran in four rounds.

The clamor immediately started for a bout between Carnera and Baer, but at the close of the year no agreements had been reached. Carnera was under contract to fight his next bout under the auspices of the Madison Square Garden Corporation and Baer was signed to perform for Dempsey and the promoters were having difficulty in getting together. Baer turned his back on the ring for a time and made a huge success in the motion pictures as well as in night clubs and vaudeville. Carnera defended his crown against Paulino Uzcudun, the Basque, in a "command" performance before Premier Mussolini in Rome in September before 70,000 persons, in the first heavyweight championship bout ever held in Italy. His showing was not impressive and he was booed by the throng for not knocking out the Basque. Carnera received the decision.

A new star appeared in the lightweight firmament in the person of Barney Ross of Chicago, almost unknown at the start of the year. Ross took the measure of Tony Canzoneri, champion, in Chicago, and then duplicated the feat two months later for the benefit of Eastern unbelievers in New York. The Chicago bout was at ten rounds, the New York one at fifteen.

The middleweight division furnished considerable activity through the year. Ben Jeby, New Yorker, earned the championship recognition in January by stopping Frank Battaglia and then defended his claim successfully before Vince Dundee and Young Terry. Lou Brouillard, left-hander, knocked Jeby out in August but ten weeks later yielded the crown to Dundee. Dundee held the championship at the end of the year after a successful defense against Andy Callahan. Jimmy McLarnin, popular battler from Vancouver, finally broke into the championship records, winning the welterweight championship in May in California. He stopped Young Corbett, who had taken the title from Jackie Fields on a decision in February, in one round. Busiest of all titleholders was Maxie Rosenbloom, light heavyweight champion, who in addition to engaging in over-the-weight bouts once every fortnight, defended his crown three times, defeating Adolph Heuser, Bob Godwin, and Mickey Walker.

Kid Chocolate retained his featherweight championship against Seaman Tom Watson of England, but was knocked out by Canzoneri and Frankie Klick in over-the-weight bouts. Al Brown, continued his mastery over the bantamweight division by downing Johnny King of England.

Ernie Schaaf, Boston heavyweight of promise, died after a bout with Carnera at Madison Square Garden in the winter. Young Stribling, Georgia heavyweight, lost his life in an automobile accident in the fall. Other boxing figures who died in the year were James J. Corbett, former world's champion, Lou Magnolia, famous referee, and William Muldoon, boxing commissioner in New York.

Syracuse University retained its Eastern Intercollegiate team championship in March, gaining four individual championship berths. The Eastern intercollegiate winners were: 115-pounds, John Napoleon, Penn State Univ.; 125-pounds, Al Wertheimer, Syracuse; 135-pounds, John McAndrews, Penn State; 145-pounds, Nick Del Genio, Yale; 155-pounds, Joe Moran, Syracuse; 165-pounds, Anthony Balash, Syracuse; 175-pounds, Bernard Kaplan, Western Maryland; heavyweight, Joe Vavra, Syracuse. The national amateur championship winners were: 112-pounds, Tony Valore, Cleveland; 118-pounds, Angelo Tardugno, Washington; 126-pounds, Louis Barisano, Boston; 135-pounds, Frank Eagan, Buffalo; 147-pounds, William Celebron, Chicago; 160-pounds, T. Chester, New York; 175-pounds, Max Marek, Chicago; heavyweight, Izzy Richter, Philadelphia.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Its national constitution declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft, and to teach them patriotism, courage, self-reliance, and kindred virtues." Each boy, on joining the organization, takes the scout oath, admonishing him to keep himself "physically strong, mentally awake, and morally straight." The movement is nonsectarian and without military or political connection.

The membership as of October, 1933, numbered 840,879, of whom 618,170 were scouts (boys 12 to 21) 30,643 cubs (boys 9 to 12), and 183,168 Scouters and Cubbers (adults connected with the movement, whether as scoutmasters, counselors, or committee members). There were 12 regional districts under the direct supervision of the national scout executives and subdivided into 554 local councils.

There are three plans of organization: a scout troop, a farm or home patrol, and a lone scout tribe. A scout troop consists normally of 32 members, each troop being made up of patrols of eight or less members under a boy leader. A scoutmaster and one or more assistant scoutmasters are provided for each troop. Troops are usually organized in connection with an existing institution, such as a church or school. A farm or home patrol may be organized with as few as two boys; it is intended for boys in rural areas. Boys who live too far away from a community to join a scout unit may become lone scouts and carry on the scout programme through correspondence, or they may meet occasionally with other boys who are carrying on the scout programme in patrols or as lone scouts.

Among the foremost scout activities are camping and hiking, nature study, sea scouting, and many kinds of athletics, and crafts, such as swimming, first aid, signaling, knot-tying, and bridge making. Successive ranks in membership—tenderfoot, second, and first class—are achieved

by passing tests, graded in difficulty. Merit badges, about 100 in number, may be attained by the scout of first class rank by meeting requirements for each; they cover proficiency in pursuits both of the useful and the hobby type. In order to attain higher ranks in scouting the boy must meet requirements for length of service, develop his leadership ability, and maintain his scout obligations. These and his earning a certain number of merit badges entitle him to the ranks of star, life, and eagle scout.

In 1933 the organization provided opportunity for over 300,000 boys to spend a week or more in boy scout camps. There were approximately 600 camps conducted by local councils. In its community service the boy scout movement coöperates with the U. S. Forestry Department in fighting and preventing forest fires and in conserving wild life, and planting trees. It renders services in local campaigns of various sorts, such as clean-up and safety-first campaigns, and coöperates with many national societies and movements.

The official magazine for boys is *Boys' Life*, and for scout leaders, *Scouting*. The national officers in 1933 were: president, Walter W. Head; treasurer, George D. Pratt; national scout commissioner, Daniel Carter Beard; chief scout executive, James E. West; deputy chief scout executive, George J. Fisher. Headquarters of the national council, the governing body, are at 2 Park Avenue, New York City.

BRAZIL. A federal republic of South America. Capital and largest city, Rio de Janeiro.

AREA AND POPULATION. With an area of 3,286,170 square miles, Brazil had a population estimated at 44,002,000 on Jan. 1, 1933 (30,635,005 at the census of 1920). The estimated population of the chief cities in 1930 was: Rio de Janeiro, 1,468,621; São Paulo, 879,788; Recife (Pernambuco), 340,543; São Salvador (Bahia), 329,898; Belém (Pará), 279,491; Porto Alegre, 273,376; Nictheroy, 108,233; Maceió, 103,930; Fortaleza, 98,848; Manaus, 88,736; Parahyba, 74,104; São Luiz, 62,895. Immigrants in 1931 numbered 31,410, including 8152 Portuguese, 5632 Japanese (22,310 in 1933), 2914 Italians, 1315 Poles, and 2621 Germans. Portuguese is the language of the country, but Italian and German are widely used in the south.

EDUCATION. In January, 1931, there were 35,435 schools (33,049 primary, 1145 high schools, 87 colleges, 211 teachers' colleges, and 943 special schools) with 73,555 teachers and a total enrollment of 2,284,883.

PRODUCTION. Agriculture is the main occupation, although only about 17,387,000 acres were under cultivation in 1932, compared with 1,236,000,000 acres of forests. Coffee is the chief crop and the main support of the national economy; in 1932 it constituted 71 per cent of the value of all exports. A preliminary official estimate placed the 1933-34 coffee crop at 2,112,000,000 pounds, compared with 3,941,520,000 pounds (provisional) in 1932-33, 3,458,400,000 in 1931-32, and 2,184,864,000 in 1930-31 (see *History*). In 1932-33 production of cane sugar was 2,138,500,000 pounds; cacao, 171,959,000 pounds; cotton, 166,344,000 pounds; rice, 36,743,000 bushels. Rubber exports (1932) were 14,381,000 pounds. Other crop yields (1930-31) were: Wheat, 4,980,000 bushels; rye, 660,000 bushels; corn, 200,144,000 bushels; potatoes, 18,172,000 bushels; tobacco, 178,153,000 pounds; alfalfa, 114,000 metric tons. Livestock

estimates as of Jan. 1, 1932, were (in thousands): Cattle, 47,492; swine, 22,099; sheep, 10,702; goats, 5,267; horses, mules, and asses, 9,618.

Mineral output in 1932, with 1931 figures in parentheses, was: Gold, 115,259 troy ounces (115,473); silver, 24,078 troy ounces (24,199); coal, 322,131 metric tons (461,500); manganese ore, 20,885 metric tons (147,349); zirconium sand (exports), 815 tons; mica (exports), 92,593 pounds (119,048); rock crystal (exports), 309 metric tons (538). Diamonds and other precious stones are produced. Cotton weaving is the principal manufacturing industry. In 1931 there were 347 cotton mills, with 2,620,500 spindles and 79,000 looms, employing 130,000 operatives. Production in that year was 688,905,000 yards of cloth, valued at \$70,300,000 (average exchange rates). The output of green silk cocoons in 1932 totaled about 600,000 kilograms. Silk factories (1931) numbered 59, with 4773 workers, the value of production totaling \$4,744,257 at the current exchange rate. The state of São Paulo, the leading industrial area, had an output in 1931 as follows (in thousands of dollars): Textiles, 38,233; leather, 3098; lumber, 6706; metal working, 19,100; ceramics, 1604; construction, 2902; chemicals, 12,395; foodstuffs, 10,261; clothing, etc. 20,990.

COMMERCE. Brazilian foreign trade during the years 1929-32 is shown in the accompanying table from the 1933 U. S. *Commerce Yearbook*. Conversions of milreis to dollars were made at the average exchange rates of \$0.1181 in 1929, \$0.1071 in 1930, \$0.0703 in 1931, and \$0.0712 in 1932. One conto equals 1000 milreis.

BRAZILIAN FOREIGN TRADE, 1929-32

	Imports (in contos)	Exports (in contos)	Imports (in dollars)	Exports (in dollars)
1929	3,527,738	3,860,482	416,626,000	455,928,000
1930	2,343,705	2,907,354	251,011,000	311,502,000
1931	1,880,934	3,398,164	132,230,000	238,891,000
1932	1,518,694	2,536,765	108,131,000	180,618,000

The principal import items in 1932 (value in thousands of dollars) were: Foodstuffs and beverages, 27,829 (including wheat, 18,043); machinery, apparatus, utensils, and tools, 13,901; iron and steel manufactures, 6706; coal, coke, and patent fuel, 5616; chemicals and drugs, 5086; gasoline, 3839. The principal exports (in thousands of dollars) were: Raw coffee, 129,865 (165,000 in 1931); cacao, 8106 (6903); Brazilian tea, 6194 (6583); edible fruits and nuts, 4965 (5892); chilled and frozen beef, 4346 (7107). The United States in 1932 purchased 46.3 per cent of Brazil's exports (43.8 per cent in 1931) and supplied 30.1 per cent of the total imports (25.1 in 1931). Other export markets were Germany, which took 8.8 per cent of the total in 1932; France, 8.9; United Kingdom, 7.0; and Argentina, 5.9 per cent. The United Kingdom supplied 19.2 per cent of the 1932 imports (17.4 per cent in 1931); Germany, 9 (10.4); Argentina, 7.4 (14.7); and France, 5.1 (4.6).

FINANCE. Brazil's budget operations during the period 1930-33 are shown in the accompanying table, in contos of 1000 milreis. The gold milreis was equivalent to 4.987 paper milreis in 1930 and to 7.792 paper milreis in 1931.

The external debt on Dec. 31, 1931, was: £97,137,000; 228,989,000 gold francs; 96,182,000 paper francs; 144,618,000 United States dollars. The internal funded debt amounted to 2,590,000 paper contos and the floating debt (excluding special

* Budget estimates.

funds totaling 1931 gold and 203,740 paper contos) to 4,202,000 paper contos. The Federal government suspended sinking fund payments on its foreign bonded debt, with the exception of the funding loans of 1898 and 1914, on Aug. 31, 1931. Interest payments thereon were suspended Sept. 19, 1931. Under a decree of Mar. 2, 1932, a scrip plan was adopted under which 20-year funding bonds were issued in lieu of interest payments in cash. The milreis (par value, \$0.1196) is the unit of currency.

COMMUNICATIONS. The Brazilian railways on Jan. 1, 1932, had 22,279 miles of line. The federal-owned Central Railway of Brazil (2082 miles) is the principal system, linking Brazil with the railways of Paraguay, Uruguay, and Argentina. In 1929 all lines carried 163,275,000 passengers and 25,764,000 metric tons of freight, the gross receipts equaling \$111,925,000. There were 90,644 miles of highway in 1932. Air lines connect the chief cities with the principal centres of South and North America. The Brazilian merchant marine in 1932 comprised 309 vessels of 496,130 gross tons. In 1931 the capacity of vessels entering Brazilian ports in foreign and coastwise trade aggregated 46,198,000 net registered tons (47,767,000 in 1930).

GOVERNMENT. The Constitution of 1891, modified in 1926, was suspended by the Provisional government of Dr. Getulio Vargas established Nov. 3, 1930. A new Constitution was being drafted by a Constituent Assembly in 1933 (see *History*).

HISTORY

DOMESTIC AFFAIRS. Definite progress toward the restoration of constitutional government in Brazil, suspended since the successful revolution of 1930, was made during 1933. The long delayed election of members of a Constituent Assembly to draft a new Constitution was held on May 3, 1933, Provisional President Vargas being obliged to yield to the overwhelming pressure of the Brazilian states. Only about 1,000,000 voters participated in the elections, partly because the electoral code required that voters be fingerprinted, photographed, and otherwise identified. The commission appointed by Provisional President Vargas to draft constitutional proposals completed its work on November 6, after many months at the task. These proposals were submitted to the Constituent Assembly, which convened in Rio de Janeiro on November 15.

The Vargas régime controlled a large majority of the 254 members of the Constituent Assembly, 214 of whom were elected on May 3. The other 40 members represented labor, trade, and professional organizations. Antonio Carlos de Andrada, former Governor of the state of Minas Geraes, was elected President of the Assembly on the first ballot. In his address before the opening session, President Vargas indicated that the demand of the São Paulo and some other state delegations for a political amnesty would be granted. He reported that the condition of the Treasury was excellent and that negotiations for adjustment

of the external debts of the Brazilian states and municipalities were proceeding satisfactorily. The total foreign debt he placed at \$237,262,553 gold.

The President urged quick action on the draft Constitution, which would leave the way open for the selection by the Assembly of a constitutional President. It was generally expected that Dr. Vargas would be chosen to succeed himself. The Assembly, however, paid little heed to the President's request. The draft Constitution proved a highly controversial document. More than 1000 amendments were proposed by Assembly members and shortly before Christmas the Assembly adjourned for one month in order to give the drafting committee time to whip the amendments into shape.

The Assembly had divided into three factions, with diverse ideas on the form and substance of the new Constitution. The younger and more progressive elements, who staged the 1930 revolution, wanted to scrap the Constitution of 1891 entirely. The older, conservative group wished to strike a compromise between the principles of the first Constitution and the proposals of the progressives. A third group, representing the labor and more radical elements, desired a constitution which would abolish capitalism in Brazil. Conflict between these groups and the alleged conservative tendencies of some members of the provisional government led to a serious Cabinet crisis during December, 1933.

The specific cause of the dispute was the appointment of a Federal Interventor for the state of Minas Geraes. The proposal to appoint a conservative to this important post led to the resignation on December 29 of Osvaldo Aranha, Minister of Finance and a leader in the 1930 revolution, and Foreign Minister Afranio de Mello Franco. The progressive group in the Assembly demanded the restoration of the two Ministers to office and that the government be retained wholly in the hands of the revolutionary groups who seized control in 1930. Negotiations for a solution of the crisis were under way at the end of the year.

President Vargas staved off repeated threats of revolt by concessions to his opponents, the chief of these being the holding of the elections and the convening of the Constituent Assembly. Another such step was the appointment on August 16 of a new Federal Interventor in the state of São Paulo. The new appointee was Armando Salles Oliveira, São Paulo newspaper owner. He immediately appointed a commission to investigate the São Paulo Coffee Institute, certain transactions of which had aroused criticism. On December 22 President Vargas signed a decree extending full amnesty to all officers and soldiers who participated in the São Paulo revolt of 1932.

In the economic field, the Vargas government carried out a programme of agricultural and industrial rehabilitation which resembled in some respects that of President Roosevelt's administration in the United States. The central feature of agricultural relief was the continuance of the plan for maintaining the price of coffee through the destruction of the surplus, the plan being financed by an export tax on coffee. The tax was reduced from \$4.23 to \$3.74 per bag in December, 1932. On Feb. 10, 1933, the Federal government took over complete control of the coffee defense scheme, abolishing the National Coffee Council and creating in its stead a National Coffee Department, subordinate to the Ministry of Finance. Between June, 1931, and the end of

1933, 26,177,000 bags were destroyed, coffee being burned at the rate of 750,000 bags monthly during 1933. Coffee in storage in Brazilian warehouses declined from 27,999,000 bags in October, 1931, to 25,048,000 in October, 1932, and to 15,500,000 in October, 1933. There was a definite upturn in coffee prices and exports in the fall of 1933, largely due to increased demand in the United States.

Similar steps were taken to protect other Brazilian producers. The output of sugar was limited and restrictions on imports of sugar, wheat, and wheat flour were imposed to raise domestic prices. On Dec. 2, 1933, President Vargas signed an act which reduced by 50 per cent the agricultural debts and mortgages in national money incurred by farmers up to June 30, 1933. Provision was made for the reimbursement of creditors through the issuance of 30-year 6 per cent tax exempt Treasury bonds, accepted as legal tender. Decrees also were issued reducing the working hours of banking establishments to 36 hours (November 3) and making similar reductions in other occupations; nullifying all clauses in contracts and other agreements stipulating payment in gold or otherwise tending to restrict the forced circulation of paper milreis (November 28); abolishing the practice of collecting taxes and customs duties in gold milreis and fixing eight paper milreis as the equivalent of the former gold milreis for tax payments (November 23). The effect of the decree was to increase customs duties and taxes, since the former ratio had been about six paper milreis to one gold milreis.

On Dec. 30, 1933, a decree was published authorizing the Minister of Finance to contract a two-year credit with the Bank of Brazil for 300,000 contos (about \$25,260,000 at current exchange) to offset an unspecified budget deficit in 1933. Early in 1933 the government announced that the fiscal year would begin on Apr. 1, 1934, for budget purposes, instead of January 1. By a decree of Aug. 2, 1933, the government made obligatory in all official publications the use of a new spelling based on phonetics rather than on etymology.

FOREIGN RELATIONS. The principal event in Brazilian foreign relations during 1933 was the visit of President Augustín Justo of Argentina and his entourage to Rio de Janeiro in October and the signing there on October 10 of 11 treaties and conventions which will draw closer the political and economic ties of the two countries. The first Argentine President to visit Brazil since 1908, General Justo was received with great public enthusiasm. Perhaps the most important treaty signed was the Anti-War Treaty of Conciliation and Non-aggression, drafted by Foreign Minister Saavedra Lamas of Argentina. For a description of these treaties, see ARGENTINA under *History*. Reciprocal most-favored-nation commercial treaties were concluded with Portugal (August 27) and with Uruguay (August 25).

Foreign Minister Mello Franco played an important part during 1933 in the negotiations for settlement of the Leticia and Chaco disputes and in the proceedings of the Pan American Conference at Montevideo in December. Capt. Alberto Lemos Basto of the Brazilian Navy represented his country on the League of Nations' commission appointed to assume control over the Leticia Corridor pending a direct settlement of the dispute. Negotiations between Peru and Colombia for a direct settlement were opened in Rio de Janeiro

on October 25 (see PERU and COLOMBIA under *History*). Also see BOLIVIA under *History* for Brazil's part in the Chaco negotiations; PAN AMERICAN CONFERENCE.

The friendly relations between Brazil and the United States were further cemented by Secretary of State Hull's visit to Rio de Janeiro and São Paulo while he was en route to the Montevideo Conference. Secretary Hull's policies at the Pan American Conference and his coöperation with the Brazilian Foreign Minister furthered this friendly feeling. A tariff war with France resulted from Brazil's exchange restrictions which tied up French funds in Brazil. Failing to secure modification of the restrictions, France in July raised her duties on Brazilian coffee and other products. President Vargas retaliated on October 24 by doubling the duties on all imports of French products. On October 31 he withheld payment of an instalment of 9,149,187 gold francs due on the Brazilian public debt to French bondholders. The same day France trebled her duties on imports from Brazil, from which country France bought 90 per cent of her coffee.

BRÉMOND, brá'mond, ABRE HENRI. A French historian and critic, died at Pau, Aug. 17, 1933. He was born at Aix-en-Provence, July 31, 1865, and attended the Catholic College there. Entering the Jesuit Order in 1882, he served his novitiate in England, where he came under the influence of Cardinal Newman, and was ordained ten years later. On his return to France in 1899 he became a teacher of classics for his order and literary critic for its paper, *Les Études*. After 1905 he contributed to *La Revue des deux mondes* and *Le Correspondant*.

Brémond's masterpiece was *L'Histoire littéraire du sentiment religieux en France depuis la fin des guerres de religion jusqu'à nos jours*. On the publication of the sixth volume in 1923, which brought the history down to the close of the seventeenth century, it received the Grand Prix de Gobert of the Academy and caused his election to that body in the same year. The eleventh volume appeared a short time previous to his death. His vast amount of knowledge gave the work a cultural solidity, while his sympathy with the subject, the freshness of his point of view, and his flowing, delicate style added a mellow charm.

Brémond's other works include: *Ames religieuses* (1902); *L'Enfant et la vie* (1902); *Newman, essai de biographie psychologique* (1907); *La Provence mystique au XVII^e siècle* (1908); *Apologie pour Fénelon* (1910); *Le Bienheureux Thomas More* (1913); *Sainte Catherine d'Alexandrie* (1917); *Les deux musiques de la prose* (1924); *Le Roman et l'histoire d'un conversion* (1925); *La Poésie pure* (1926); and *Prière et poésie* (1926). In recognition of his brilliance and liberalism his work was crowned by the Academy on four occasions. In 1928 Oxford University conferred on him the honorary D.Litt. degree.

BRETHREN, CHURCH OF THE. A church established in the United States in 1719 at Germantown, Pa. It originated at Schwarzenau, Germany, in 1708 and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of the group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh-day Baptists; and Old Order German Baptist Brethren.

The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences in North America and six abroad, and holds a general conference annually.

In 1933 there were in the United States and Canada 1030 churches and 1464 meeting houses, with a membership of 149,914, and 1160 Sunday-schools, with an enrollment of 121,636. Foreign missionary work was carried on in India, China, and Africa, the total membership in the mission field being 6459. Expenditures for the year ending Feb. 28, 1933, totaled \$172,164. The denomination maintained eight colleges and one theological seminary and training school, with an enrollment of 4199 students. Dr. D. W. Kurtz was installed as president of the seminary to succeed Dr. A. C. Wieand who had served in that capacity for 27 years. The last of the academies, Daleville, closed its doors in 1933. The *Gospel Messenger* is the official organ.

At its meeting in June, 1933, the general conference of the Church of the Brethren appointed a committee on fraternal relations, whose special aim was to cultivate a coöperative attitude on the part of the several branches of the denomination. The following officers were elected: Moderator, the Rev. Charles D. Bonsack, Elgin, Ill.; reading clerk, the Rev. H. K. Ober, Elizabethtown, Pa.; and secretary, the Rev. J. E. Miller, Elgin, Ill. The Rev. J. W. Lear of Elgin, Ill., was executive secretary of the council of boards; the Rev. Otho Winger of North Manchester, Ind., president of the general mission board; the Rev. C. S. Ikenberry of Daleville, Va., president of the board of Christian education; the Rev. H. L. Hartsough of North Manchester, Ind., president of the general ministerial board; and Dr. C. C. Ellis of Huntingdon, Pa., president of the general education board. The headquarters of the boards are at Elgin, Ill.

BRIDGE. See CONTRACT BRIDGE.

BRIDGES. Bridge building operations in the United States, although undoubtedly adversely affected by the depression, received a very considerable impetus from federal financing, and there has been considerable activity throughout the year. The great Golden Gate Suspension and the unique San Francisco-Oakland bridges naturally drew attention to these Pacific Coast structures, but there are several other works which, although smaller in size, are not lacking in interest.

GOLDEN GATE. As soon as the final legal difficulties had been cleared up in February, 1933, this work went rapidly forward. By the close of the year about 20 per cent of the total project had been finished and contracts for most of the remainder had been let. It is planned to complete the structure in 1936 at a cost now estimated at \$32,000,000, the R.F.C. participating in the financing.

The main dimensions of this bridge, which will be the world record for span, are as follows: Main span, 4200 feet. Clearance, 220 feet. Side spans, 1125 feet. Length including approach viaducts, 9217 feet. Total length, including ramps and roadways, four and one-half miles. Width between stiffening trusses, 90 feet, giving a 60-foot roadway and two 11-foot sidewalks. Cables thirty-six and one-half inches in diameter, and 7660 feet between anchorages.

By the end of the year, the tower foundations, involving 90 by 185 foot caissons and fender cas-

ings around the piers 27½ feet thick, had been completed. The steel work of the towers had also been begun and was rapidly approaching roadway level.

At this stage of the work, the tower construction is undoubtedly the most interesting feature. These towers represent a completely different design than the braced column plan used on the George Washington Bridge in New York. Each tower is composed of two cellular shafts tied together by crossed braced frames. It would seem probable that this type of construction would involve considerably more field riveting than the Hudson Bridge type, and would thus normally cost more per ton in place. Under present conditions, however, the low steel prices reflect no such difference.

A complete model of one of these towers, one fifty-sixth actual size, has been built in stainless steel and has been under exhaustive tests at Princeton University. These tests confirm the principles used in their design, and the model indicates that the towers will be most monumental and imposing in appearance.

SAN FRANCISCO-OAKLAND. Work on this combination of suspension and cantilever spans is also progressing rapidly, following a grant and loan of the R.F.C., and it is planned to be completed in 1937.

The towers on the unique twin suspension spans of 2310 feet over the West Channel are similar in type to the Golden Gate Bridge, but with different bracing, and were finished during the year. The large section highway tunnel through Yerba Buena Island was well under way.

The main bridge structure will have two decks—an upper one of 58 feet for six-lane passenger and light motor truck traffic. The lower deck is to carry three lanes of heavy truck traffic on a 31-foot roadway and two interurban lines. Welded trusses for reinforcing the novel concrete decks are provided.

In the construction of the centre or common anchorage of the two suspension spans, a record caisson was used (see **FOUNDATIONS**) and the concrete plant with a capacity of 400 cubic yards per hour furnished another example of the ability of the American engineering-contractor to handle such large-scale operations. (See also *Cantilevers* in next column.)

TRIBOROUGH BRIDGE, N. Y. On August 24th the P.W.A. announced that it would participate in the construction of the combination of bridges over the East and Harlem Rivers in New York which are known collectively as the Triborough Bridge. The foundations for this structure were completed several years ago (see 1931 **YEAR BOOK**) but, due to lack of funds, work had practically ceased. The project, however, again got under way with the letting of contracts for the towers and anchorages on November 16th.

STEEL ARCHES. The 780-foot tied arch over the Ohio at Pittsburgh is, of course, not a record-breaking span, but it is of interest because of the use of wire rope hangers, similar to those used on the famous Bayonne Arch (see 1929 **YEAR BOOK**), but using cables of the unusual size of four inches.

Among the smaller bridges of this type, the new French King Bridge built by the Massachusetts Department of Public Works on the Mohawk Trail Highway, again emphasizes the inherent beauty of the arch form. Its graceful 460-foot main span with similarly arched ap-

proach spans shows the spandrel braced arch at its best.

TRUSSES. The development of the continuous truss idea was marked by the construction of a small, light, three-span truss of this type over the Missouri north of Helena, Montana. The total length of this bridge is only 450 feet but its construction shows the growing confidence of American engineers in the continuous truss.

It would appear at first sight that the five spans of the Little Belt Bridge now being constructed to join the Island of Fyen with the Jutland Peninsula, Denmark, were also a continuous truss form. Actually this 2706-foot bridge consists of five cantilevers, having an almost horizontal top chord throughout. The design is unusual but has been adopted as most economical and satisfactory for this site.

CANTILEVERS. Under this heading we should note the 1400-foot cantilever of the East Bay Crossing of the San Francisco-Oakland or Bay Bridge. This will be a notable cantilever span—only 400 feet less than the record of the famous Firth of Forth and the Quebec cantilevers.

Another important development in this type of construction is the New Orleans Public Belt Railroad Bridge over the Mississippi River which, after much delay, was at last under way as the year came to a close. The War Department permit covering this work having expired, in the new permit issued in 1932 the required clearance was increased from 117 to 135 feet. As redesigned, the bridge consists of a 790-foot cantilever with two 530-foot approach spans. The R.F.C. has stepped in to lend the first mortgage bonds, on January 20 the first foundation pile was driven, and on December 30 the contracts for the bridge were let.

On Oct. 21, 1933 the Red River Bridge at Shreveport, Louisiana, a 520-foot steel cantilever, was dedicated. These activities show that the cantilever type has held its position in recent bridge construction as a basic and economical form.

VIADUCTS. The need for special traffic facilities in and near large cities, which has led to notable viaduct constructions such as the \$21,000,000 work over the Newark Meadows near New York, and other structures of this type, continued to be pressing. In Kansas City, Kansas, the new Seventh Street Trafficway is under construction. Richmond, Virginia, with aid from the R.F.C., is starting a new traffic outlet over the James River which, although it can be classed as a multiple concrete arch structure, is essentially a relief viaduct. The East 6th Street Viaduct, Los Angeles, was opened June 16.

Perhaps one of the most unique structures of this type, however, is a railroad work—the new viaduct of the New York Central Lines on the lower West Side in New York. In one case this heavy freight viaduct was carried through an existing building, the Bell Telephone Laboratories, during occupancy and so as to avoid vibration from train operation.

LIFT BRIDGES. After fifty years of service the old highway bridge over the Hudson between Albany and Rensselaer, New York, has been replaced by a new structure having a vertical lift span of 341 feet. By using silicon steel, the weight of the span was kept down to 2730 tons. The operating mechanism (electric with gasoline engine in reserve) is of interest. A duplicate of this bridge is now under construction between Troy and Menands, New York.

BOULDER DAM, COLORADO RIVER

Partly Filled Form of the Base of the Dam, Showing Progress of Work on Sept 22, 1933

CANALS AND DAMS

Due to the financial difficulties of the British government, which have almost eliminated grants for public works, there are no outstanding bridge works to record for the British Isles in 1933. In fact, the most important British work of the year is the Tees lift bridge, to be opened early in 1934. Crossing the Tees at Middlesbrough the lift span of 250 feet, not a remarkable span, provides a clear headroom of 120 feet.

CONCRETE BRIDGES. The George Rogers Clark Memorial Bridge at Vincennes, Ind., a handsome structure of moderate spans (max. 180 ft.) was dedicated September 3. An unusual construction feature involved the use of one form with which the ribs were built successively. The Gavioto Canyon (Colorado) arch is notable for its unprecedented skew of 57°.

Recalling the American record span of the George Westinghouse Bridge at Pittsburgh (460 feet), these concrete arches of 1933 appear to be unimportant. It is interesting to note, however, that while American engineers in the past have generally built their concrete bridges of very massive and monumental form, the engineers on the Pacific Coast, at least, are turning to the more daring, slender construction characteristic of many European concrete arches. This is well illustrated by the 320-foot Bixby arch on the scenic California Coast highway about fifteen miles south of the Monterey Peninsula. Its slender ribs form a beautiful open spandrel arch which supports the floor, 265 feet above the creek bottom.

In the field of concrete bridge construction, however, European engineers still hold the records. Indeed, the outstanding bridge accomplishment of 1933 is probably the Traneberg Arch which must be credited to Swedish designers.

This beautiful concrete structure, spanning the harbor of Stockholm, Sweden, in one graceful arch of 585-foot span, ranks not only as one of the greatest concrete arches in the world (span only exceeded by Plougastel Bridge at Brest, France) but has several interesting design features.

The structure consists of two huge reinforced concrete ribs which were erected on a steel arch centring. After being used for one rib, this centring was moved laterally and used again for the second rib. The bridge carries a roadway and two tracks of suburban electric railway. Inasmuch as its alignment is almost due east and west, so that the south rib may be subjected to greater temperature ranges than the north, special articulation of the road surface was provided. (See *The Engineer* (London) Sept. 15, 1933.)

Bridge Floors. One of the most talked of items among bridge engineers in recent years has been the matter of bridge floors. Reinforced concrete, special light concrete, steel plates, steel gratings, and other forms have been designed and tested with the object of securing a suitable floor and floor finish for motor traffic, which will be lighter than many existing bridge floors, and will thus result in a reduction of dead load. This item of bridge design promises to show interesting developments in the near future.

In this connection the removal of the old floor of the Smithfield Bridge at Pittsburgh and its replacement by a light, high-strength aluminum alloy construction, is of interest. Opinion seems to differ as to the qualities of aluminum for such

work, but the saving in dead load will give a new lease of life to this historic structure.

BRIDGE PROPOSALS. The very substantial list of proposals for 1934 give promise of a continued activity in this field in the new year. Plans for a span of 1200 feet at Tacoma, Wash., a new bridge at Lachine west of Montreal, the high-speed viaduct between Camden and Philadelphia, the Tampa Bay Crossing in Florida, the two latter stimulated by R.F.C. loans, indicate that interesting and important work will be under way in 1934.

BRIGHAM YOUNG UNIVERSITY. A co-educational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. It comprises a graduate school; colleges of arts and sciences, education, commerce, applied science, fine arts; and a division of research and extension. In the 1933 summer session 532 students were enrolled; the autumn session enrollment was 1607. The faculty numbered 115 members. The library contained 86,000 volumes and 50,000 pamphlets. The budget for the year was \$267,000. President, Franklin Stewart Harris, Ph.D.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in York, England, in 1831, and incorporated by Royal Charter in 1928, for the purpose of fostering the interests of workers in all branches of science and to give a stronger impulse to scientific research, both theoretical and practical.

The annual meeting was held at Leicester, Sept. 6-13, 1933, under the presidency of Sir Frederick Gowland Hopkins, professor of bio-chemistry at the University of Cambridge. In accordance with the provisions of the association's new statute he had been installed at a joint meeting of the organizing sectional committees held at Birkbeck College, London, Jan. 6, 1933. His address at the meeting's opening session was entitled "Some Chemical Aspects of Life." Among the other speakers at the general sessions were Sir Henry Fowler whose topic was "Transport for a Century," Julian Huxley who spoke on "Ants and Men," and Sir Josiah Stamp whose address was entitled "Must Science Ruin Economic Progress?"

Of equal importance were the section presidential addresses. They included "Seasonal Weather and Its Prediction," delivered by Sir Gilbert T. Walker (mathematical and physical sciences); "Natural Coloring Matters and Their Analogues," by Robert Robinson (chemistry); "A Correlation of Structures in the Coalfields of the Midland Province," by William George Fearnside (geology); "The Mechanical View of Life," by James Gray (zoology); "Geography as Mental Equipment," by Lord Meston (geography); and "The Gold Standard," by J. H. Jones (economic science and statistics). Richard W. Allen (engineering) spoke on "Some Experiences in Mechanical Engineering"; Lord Raglan (anthropology), on "What Is Tradition"; E. D. Adrian (physiology), on "The Activity of Nerve Cells"; F. Aveling (psychology), on "The Status of Psychology as an Empirical Science"; Francis Ernest Lloyd (botany), on "The Types of Entrance Mechanisms of the Traps of Utricularia"; J. L. Holland (educational science), on "The Development of the National System of Education"; and Alexander Lauder (agriculture), on "Chemistry and Agriculture."

The Association's 1934 meeting was to be held at the University of Aberdeen under the presidency of Sir William Bate Hardy, director of food investigation for the Department of Scientific and Industrial Research. The other officers elected for 1933-34 were: General secretaries, F. J. M. Stratton and P. G. H. Boswell; general treasurer, Sir Josiah Stamp; and secretary, O. J. R. Howarth. Headquarters are at Burlington House, London.

BRITISH CAMEROONS. See under CAMEROON.

BRITISH COLUMBIA. A maritime province of Canada on the Pacific Ocean, having Alberta as its eastern boundary. Area, 355,855 square miles; population (1931) census, 694,263 compared with 524,582 in 1921. Victoria, the capital, had 39,082 inhabitants in 1931 (38,727 in 1921); Vancouver, 246,593 (163,220); New Westminster, 17,542 (14,495); North Vancouver, 8510 (7652); Trail, 7573 (3020). In 1931 births totaled 10,404; deaths, 6114; marriages, 3879. Education is free and non-sectarian since 1872 and school attendance is compulsory for children from 7 to 15 years of age. In 1931 there were 1038 elementary schools with 91,173 students and 91 high schools (11 were junior high schools) with 22,007 students. The University of British Columbia (Provincial) had 2309 students (including 265 at Victoria College), and 2 normal schools had 456 students, in 1930-31.

The area sown to field crops in 1932 totaled 437,700 acres and these crops were valued at \$10,714,000. The estimated gross agricultural revenue for 1932 was \$29,031,000; the production of the principal crops in bushels was: Wheat, 1,408,000; oats, 4,422,000; barley, 288,000. The potato crop amounted to 2,297,000 cwt.; turnips, etc., 1,062,000 cwt.; hay and clover, 276,000 tons; grain hay, 104,000 tons. Livestock (1931 census), horses and mules, 57,366; cattle, 233,923; sheep, 146,577; goats, 5676; swine, 51,756; poultry, 4,371,685. Mineral production for 1932 was valued at \$26,855,997 of which gold equaled \$3,742,274; silver, \$2,429,938; copper, \$3,798,216; lead, \$5,808,640; zinc, \$3,214,200; coal, \$7,273,800. The production of fish for 1932 was valued at \$9,914,071 and amounted to 3,450,409 cwt.; salmon accounted for \$7,592,460 of the total value. Raw furs and skins taken in the year ended June 30, 1932, totaled 201,522 and were valued at \$576,102. Lumber and other sawmill products were valued at \$26,989,000 for 1931. The gross value of manufactured products of British Columbia for 1932 amounted to \$241,121,932. The 1933 salmon pack was 1,247,471 cases of 24 pounds each.

For the fiscal year ended Mar. 31, 1932, provincial revenue amounted to \$28,088,696 and expenditures to \$28,080,030; gross funded debt was \$116,060,611; sinking funds amounted to \$21,519,601. Revenue was estimated to total \$20,500,000 and expenditure \$22,700,000 for the year 1933-34. There were 4097 miles of steam railroads in operation during 1931. Government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The 18th legislative assembly elected early in November, 1933 consisted of the following: Liberals, 34; Coöperative Commonwealth Federation, 7; others, 6. Only 1 Unionist a former Conservative was elected. Lieutenant-Governor in 1933, John W. F. Johnson. Premier T. D. Pattullo (Liberal) succeeded S. F. Tomlie as a result of the November election. See CANADA.

BRITISH COMMONWEALTH RELATIONS CONFERENCE. See CANADA under History.

BRITISH EAST AFRICA. The British sphere in East Africa comprising KENYA Colony and Protectorate, UGANDA Protectorate, and the mandated territory of TANGANYIKA. See these articles.

BRITISH EMPIRE. An empire comprising (1) GREAT BRITAIN and NORTHERN IRELAND, CHANNEL ISLANDS, and ISLE of MAN; (2) the IRISH FREE STATE, INDIA, and the various British Dominions, Colonies, Protectorates, and Dependencies. Including the mandated territories of PALESTINE, SOUTH WEST AFRICA, CAMEROONS, TOGOLAND, WESTERN SAMOA, and NAURU, the British Empire had a total area of 13,355,426 square miles and a population (1931 census figures used where available) of 449,583,000. Consult these articles.

BRITISH FILMS. See MOTION PICTURES.

BRITISH GUIANA, gë-ä'nä. A British colony on the north coast of South America between Surinam (Dutch Guiana) and Venezuela. The territory includes the counties of Demerara, Berbice, and Essequibo; each named after one of three rivers. Total area, 89,480 square miles; population (1931 census), 310,933 (excluding 7379 aborigines). The total estimated population on Jan. 1, 1933 was 317,813, including 10,732 Europeans, 134,059 East Indians, 126,077 Blacks, and 8430 aborigines. Georgetown, the capital, had 62,690 inhabitants in 1931. In 1932, births numbered 10,825; deaths, 6694; marriages, 1157. There were 230 elementary schools with 45,391 students, 2 secondary schools, and a government college at Georgetown, in 1932.

The area under cultivation is about 180,366 acres; the chief agricultural products for 1932 were sugar, 148,034 tons from 62,905 acres; rice, about 60,869 tons; coffee, 1,054,451 lbs. exported, 5800 acres planted. Coconuts, cacao, rubber, and limes are other agricultural products. Livestock (1932), horned cattle 186,175; sheep 32,799; swine 17,499; goats 15,355; asses 7486; horses 4362; mules 1616; buffaloes 126. The forests have an area aggregating 77,278 square miles; timber taken from crown lands amounted to 580,205 cubic feet in 1932, and 765,475 lbs. of balata (gum) valued at £31,082 were exported in the same year.

The production of the principal minerals for 1932 was as follows: Gold, 15,171 ozs. valued at £64,634; diamonds, 60,185 carats valued at £118,865; bauxite, 92,434 tons were exported to the United States and Canada: manganese and mica are also found. There are local factories for the manufacture of matches, boots and shoes, and edible oil manufactured from coconuts which compares favorably with imported cooking oils. Total imports for 1932 amounted to £1,690,891; exports, including reexports, £2,208,901.

Roads have a total length of some 500 miles; trails, including a government cattle trail of 182 miles from Takama to Annai, 514 miles; the new road from Bartica to Potaro Landing which includes a suspension bridge over the Potaro River was completed during 1933. There were 78 miles of railway line in operation; 450 miles of river navigation; and 39 miles of canals. The main wireless station at Georgetown is in communication with 5 wireless stations in the interior. Georgetown is on the route of the weekly air mail service between Miami, Florida, and Brazil.

In 1932, government revenue from all sources amounted to £1,179,615; expenditure, £1,137,789. The public debt on Jan. 1, 1933 was £4,648,063 and the sinking fund amounted to £731,678. The colony is administered by a governor assisted by a legislative council of 10 official members and 19 unofficial members. Governor in 1933, Sir E. B. Denham.

BRITISH HONDURAS, hõn-dõõ'rás. A colony belonging to Great Britain bounded west and south by Guatemala, north by Mexico, and east by the Caribbean Sea. Area, 8598 square miles; population (1931 census), 51,137; estimated population on Jan. 1, 1932 was 52,945. Belize, the capital and chief town, had 16,687 inhabitants (1931 census). The total average school enrollment for the year 1932 was 8385 and the average attendance was 6854.

The chief products are bananas, mahogany, logwood, plantains, coconuts, and chicle. In 1932 exports totaled \$1,447,484 (domestic exports, \$297,580; reexports, \$1,149,904) compared with \$2,911,066 for 1931. The drop in reexports was caused by lower chicle exports and the large curtailment of the liquor-smuggling traffic; the decrease in domestic exports was due primarily to the collapse of foreign markets for mahogany and cedar logs. Imports in 1932 totaled \$2,301,838 (\$4,435,358 in 1931). Shipping entered in 1931 aggregated 327,271 tons. There are 25 miles of railway, and 925 miles of telegraph lines with 32 offices. The air-mail and passenger service between Miami, Florida, and Cristobal, Canal Zone, uses Belize as a stopping point.

For 1932-33 revenue amounted to \$893,716; expenditure, \$940,285; public debt, \$2,598,407. The administration is under a governor assisted by an executive council of 7 members, and a legislative council of 6 official members and 7 unofficial members. Governor and Commander-in-Chief in 1933, Sir Harold Kittermaster.

BRITISH INDIA. See INDIA.

BRITISH LABOR PARTY. See SOCIALISM.

BRITISH MALAYA. The entire Malay peninsula from Siam on the north to the Strait of Singapore in the south is under British control, the component administrative divisions are (1) Straits Settlements, (2) Federated Malay States, (3) Unfederated Malay States. Total area, 52,603 square miles; total population (1931 census), 4,351,180. The chief cities are Singapore, the capital, with 445,778 inhabitants in 1931; and Georgetown (Penang), 149,327. Three other British protectorates in Malaysia—British North Borneo, Brunei, and Sarawak—are seldom included in the term British Malaya and are never covered by British Malayan statistics. The statistics of the foreign trade for British Malaya include the Straits Settlements, the Federated, and the Unfederated States. The chief agricultural products were rubber, copra, palm oil, sugar, tapioca, pineapples, and resin. In 1932 exports of rubber amounted to 478,252 tons (519,590 tons in 1931); pineapples, 2,000,000 cases shipped; rice production was increased 10 per cent to 15 per cent during the year. Tin production was stopped during July and August of 1932 and the production for the remaining 10 months of the year ending July 1, 1933, was to be limited to 30 per cent of the total 1929 production. Gold production, from practically the only gold mine in the country, was 27,782 oz. (22,686 oz. in 1931). In 1932, including bullion and specie, total imports were valued at 384,371,000

Straits dollars; total exports, 367,599,000 Straits dollars (Straits dollar averaged \$0.404 for 1932). The 1933 trade was: Exports, 402,500,000 Straits dollars; imports, 367,500,000 Straits dollars. See STRAITS SETTLEMENTS, FEDERATED MALAY STATES, and UNFEDERATED STATES.

BRITISH NORTH BORNEO. A British protectorate occupying the northern part of the island of Borneo, bounded on the southwest by Sarawak. Area, about 31,106 square miles, and a coast line of about 900 miles; total population (1931 census), 270,223, consisting chiefly of Mohammedans on the coast and native tribes in the interior. Europeans numbered 340; Eurasians, 236; Chinese, 47,799; Malay Archipelago natives, 11,494. Chief towns are the capital Sandakan (population 13,826), and Jesselton.

The chief products are timber, sago, rice, coconuts, gums, coffee, rubber, and tobacco. Total exports in 1931 were valued at £878,994; imports were valued at £509,273; revenue amounted to £297,950 and expenditure to £250,858. Trade is carried on chiefly, through Singapore and Hong Kong, with the British Empire. A railway runs from Jesselton to Melalap 127 miles in the interior. Shipping entered and cleared during 1931 was 352,876 and 348,063 tons respectively. The territory is administered by a governor in Borneo and a board of directors in London under the jurisdiction of the British North Borneo Company. Governor in 1933, A. F. Richards.

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. The following British colonies, protectorates, and mandated territories comprise British West Africa: Nigeria colony and protectorate, and the mandated territory known as British Cameroons; Gambia colony and protectorate; Gold Coast colony with Ashanti, the Northern Territories, and the British mandated area in Togoland; Sierra Leone colony and protectorate. Consult the separate articles.

BRITISH WEST INDIES. The British West Indies consist of (1) BAHAMAS; (2) BARBADOS; (3) JAMAICA with Turks Islands; (4) LEEWARD ISLANDS; TRINIDAD with Tobago; (6) WINDWARD ISLANDS. See separate article on each group.

The Royal commission appointed in 1932 to study the feasibility of a closer administrative union of the British West Indies submitted its report in September, 1933. The commissioners reported that it was impracticable to unite all the islands, but recommended the union of the Leeward and Windward Islands under a governor with headquarters at St. Lucia.

BROMINE. See PHYSICS.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in the social sciences, established in Washington, D. C., in 1927. Its purposes are: to aid constructively in the development of sound national policies, and to offer training of a super-graduate character to students of the social sciences. It maintains, as operating units, the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had at least two years of graduate work are accepted as research fellows. It provides also headquarters for visiting scholars who come to the national capital to make use of the material available there on eco-

monic, political, historical, social, administrative, and legal problems, as found in library collections and in the records of the various government departments.

By charter provision the investigations of the institution are conducted "without regard to the special interests of any group in the body politic, whether political, social, or economic." During 1932 the following studies were published: *The Society of Nations: Its Organization and Constitutional Development*; *War Debts and World Prosperity*; *Bankers' Profits from German Loans*; *Credit Policies of the Federal Reserve System*; *Advertising Allowances*; *A Phase of the Price-Making Process*; *Unemployment Insurance in Austria*; *State Centralization in North Carolina*; *The Federal Radio Commission*.

The institution is supported from endowment funds and annual grants. The board of trustees, a self-perpetuating body, has general responsibility for determining the institution's policies and its programme of work, but does not assume responsibility for each particular investigation. The officers of the board of trustees for 1933-34 were: chairman, Frederic A. Delano; vice chairman, Leo S. Rowe; treasurer, Henry P. Seidemann; and President, Harold G. Moulton. Headquarters are at 722 Jackson Place, Washington, D. C.

BROOKLYN COLLEGE. A coeducational institution of higher education in Brooklyn, N. Y., founded in 1930 as one of the three institutions of higher learning supported by municipal taxes and administered by the Board of Higher Education. The others are Hunter College and the College of the City of New York. The enrollment for the autumn of 1933 was 10,116. The 1933 summer session had an attendance of 2523. The faculty numbered 468. There were 24,943 volumes in the library. President, William A. Boylan.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An institution in Brooklyn, N. Y., composed of four divisions—education, museum of arts and sciences, children's museum, and a botanic garden. It was founded in 1824 and incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The education division is divided into the following departments, composed of members interested in a particular field: Agriculture, astronomy, botany, dramatic art, electricity, fine arts, geography, geology, music pedagogy, philology, philosophy, photography, physics, political science, psychology, and sociology. These departments conduct courses and sponsor addresses, lectures, and concerts. A forum conducted by the departments of political science and sociology provides for the discussion of current problems. The enrollment in the school of pedagogy in 1933 was 2240, with an attendance at lectures of 344,127.

The institute's museums contain collections in the fields of art, ethnology, and natural science; its botanic garden comprises more than 50 acres. Attendance at the museums during the year was 1,381,146 and at the botanic garden, 1,307,000. The library contains more than 27,000 volumes. In 1933 the permanent funds of the institute amounted to \$3,479,726: the funds to meet current expenses totaled \$864,784. The president of the board of trustees was Edward C. Blum; director of the division of education, Charles D. Atkins; of the museum of arts and sciences, William Henry Fox; of the children's museum, Anna

B. Gallup; and of the botanic garden, C. Stuart Gager. Headquarters are at Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

BROWN UNIVERSITY. An institution of higher education in Providence, R. I. Founded in 1764, it is the seventh oldest college in the United States and the third in New England. It has three major subdivisions: The College, for undergraduate men; Pembroke College for undergraduate women; and the Graduate School. The College includes a division of engineering. The enrollment in the autumn of 1933 was 1267 undergraduate men, 467 undergraduate women in Pembroke College, 322 graduate students, and 33 special students in education. The faculty consisted of 209 members, including 120 professors, 43 instructors, 8 lecturers, and 38 assistants. The productive fund of the university on June 30, 1933, was \$10,284,543. Gifts and bequests included \$252,518 from the estates of Henry L. and Charles T. Aldrich and \$100,000 for the John Hay Library from Webster Knight and \$100,000 from C. Prescott Knight. A number of special projects were being carried on with the aid of special funds provided for the purpose, including a research project on the International Gold Standard by the department of economics and the Linguistic Atlas of the United States and Canada. Larger opportunities have been offered for the study of art through cooperative arrangements with the Rhode Island School of Design. The libraries contained approximately 500,000 volumes. President, Clarence Augustus Barbour, D.D., S.T.D., LL.D.

BRUNEI, brōō'nī. A native state between British North Borneo and Sarawak in the northwest of the island of Borneo, under British protection. Area, about 2500 square miles; population (1931 census), 30,135, including 60 Europeans, 2683 Chinese, and 377 Indians. Brunei, the capital town, had 10,453 inhabitants. In 1931 there were 10 vernacular schools with 598 pupils.

Native industries in the town of Brunei are boat building, cloth weaving, silver ware manufacture, and brass founding. Rubber, jelutong, cutch (mangrove extract), and sago are the important products. Many kinds of serviceable timber are produced in the jungle which occupies most of the interior part of the country. An oil field is being developed at Sera on the coast where oil was found in commercial quantity. The average annual rainfall is about 100 inches. In 1932 imports totaled £283,529; exports, £175,669; revenue, £42,280; expenditure, £39,005; public debt (Jan. 1, 1933), £45,383.

On Jan. 2, 1906 the Sultan of Brunei made a treaty by which the general administration of the state was handed over to a British Resident. British Resident in 1933, T. F. Carey.

BRUNSWICK, brūnz'wīk. One of the states of the German Republic. See GERMANY under Area and Population.

BRUSH, EDWARD NATHANIEL. An American psychiatrist, died in Baltimore, Md., Jan. 10, 1933. He was born at Glenwood, N. Y., Apr. 23, 1852, and was graduated with the M.D. degree from the University of Buffalo in 1874. After practicing medicine in Buffalo he was appointed in 1878 assistant physician at the New York State Lunatic Asylum in Utica. Six years later he was called to the Pennsylvania Hospital for the Insane in Philadelphia in the same capacity. Upon the founding in 1891 of the Sheppard and

Enoch Pratt Hospital in Baltimore, one of the first model institutions for the care of the mentally sick in the United States, he became its physician-in-chief and medical superintendent. He was appointed to the professorship of psychiatry at the University of Maryland and at the College of Physicians and Surgeons of Baltimore in 1899, but retired as emeritus from all three of these positions in 1920.

Dr. Brush was well known as a writer on insanity, and for more than 50 years was connected with the *American Journal of Insanity* (later *Psychiatry*), first as associate editor (1878-84 and 1897-1904) and then as editor (1904-31). He also served as president of the American Psychiatric Association during 1915-16 and of the Mental Hygiene Society of Maryland from 1914 to 1926, and was an honorary member of medico-psychological societies of Great Britain, France, and Belgium.

BRYN MAWR COLLEGE. An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1933 totaled 497. The teaching staff numbered 83. The productive funds of the college amounted to \$5,995,654 in the autumn of 1933 and the receipts for the year 1932-33 were 879,890. The number of volumes in the library was 143,000. President, Marion Edwards Park, Ph.D., LL.D.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1933 the enrollment was 969, of whom 609 were men and 360 women. At the junior branch, opened in Wilkes-Barre, Pa., there were 164 freshmen, 123 men and 41 women. Of the 352 students enrolled in the summer session of 1933, 208 were men and 143 women. The faculty numbered 78. The productive funds amounted to \$1,700,000, and the income for the year was \$700,000. The library contained 60,000 bound volumes. The Literature Building, the first unit of the new building programme, was to be ready for occupancy in February, 1934. President, Homer Price Rainey, Ph.D., LL.D.

BUCKWHEAT. The production of buckwheat in the United States in 1933 as estimated by the Department of Agriculture amounted to 7,844,000 bushels as compared with 6,727,000 bushels in 1932 and 9,913,000 bushels, the average yield of the five years 1926-1930. The acreage in 1933 although only 462,000 acres was still nearly 2 per cent above that of the preceding year but 30 per cent under the average acreage of 664,000 acres for the 5-year period. The average yield per acre, 17 bushels, was 1.2 bushels above the average acre yield in 1932 and 0.48 of a bushel above the 5-year average. With the exception of 1932 the country's production in 1933 was the lowest since 1928 and the acreage the smallest since 1874.

As usual during recent years the production of buckwheat was reported by the same 23 States, all east of the Rocky Mountains, and New York and Pennsylvania were again the leading producing States, yielding 67 per cent of the total crop. The estimated yields, in bushels, of the six leading States, producing over 84 per cent of the nation's crop, were reported as follows: Pennsylvania, 2,679,000; New York, 2,641,000; West Virginia, 407,000; Ohio, 372,000; Maine, 320,000; Michigan, 284,000. During the fiscal year ended

June 30, 1933 the United States exported only 33,000 bushels of buckwheat as compared with 524,000 bushels in the preceding fiscal period. No imports were recorded. The exports of buckwheat vary widely from year to year having ranged from 22,000 bushels in 1929 to over a million bushels for several years in succession in the late sixties.

BUFFALO, THE UNIVERSITY OF. A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846 under a charter received from the State Legislature. The enrollment for the autumn of 1933 was distributed as follows: College of arts and sciences, 756; school of law, 177; school of dentistry, 131; school of medicine, 282; school of pharmacy, 113; school of business administration, 205; nurses training school, 257; school of education, 464; University of Buffalo extension courses, 1916. The enrollment for the 1933 summer session was 762. The faculty numbered 476 in the autumn of 1933. The library contained 97,129 volumes and 87,450 pamphlets. Chancellor, Samuel P. Capen, Ph.D., LL.D., LL.D.

BUILDING. Though it seemed unbelievable that the building programme could shrink to a lower level than that reached in 1932, the value of the buildings for which permits were granted in 1933 for the 215 cities in the United States which are included in *Dun and Bradstreet's* annual summary, was about 20 per cent lower than in the previous year. The total in these cities was \$313,739,676 for 1933, \$399,288,930 for 1932, and \$1,158,963,273 for 1931. However, this decrease was the result of the extreme depression of the industry in the first four months of the year, in each of which the building permits granted were more than 50 per cent less than in the corresponding months of the previous year. Thereafter, except in May and November, the monthly totals were slightly higher than in the same months of 1932.

In a grouping of 215 American cities by sections, the West Central section showed the least decline for the year and the South Atlantic the greatest. New York City, in the Mid-Atlantic section, showed a slight improvement in building activities, amounting to 4.6 per cent over the previous year. It is interesting to observe in the accompanying tabulation of the eight sections that building activities in New York City accounted for more than 25 per cent of the grand total:

BUILDING PERMITS IN THE UNITED STATES
FOR 215 CITIES, 1932-1933
[From *Dun and Bradstreet's*]

	1933	1932	Change per cent
New England . . .	\$ 26,891,076	\$ 34,424,759	-21.9
Middle Atlantic . .	120,138,547	134,374,448	-10.6
South Atlantic . .	25,406,922	44,863,964	-43.4
East Central . . .	33,618,661	59,234,144	-43.2
South Central . . .	26,511,299	31,777,864	-16.6
West Central . . .	25,187,223	27,288,952	-7.7
Mountain	4,333,183	5,521,910	-21.5
Pacific	51,652,815	61,802,889	-16.4
Total U. S. . .	313,739,676	399,288,930	-21.4
New York City . .	81,812,850	78,183,889	+ 4.6
Outside New York City	231,926,826	321,105,041	-27.8

The foregoing figures, however, reflect activities in housing and in office building rather than in general engineering construction, and do not include expenditures for public and private works.

According to estimates in the annual review number of the *Engineering News-Record*, the total expenditures for all construction in the United States during the year amounted to \$2,440,000,000, as compared with a total of \$2,839,000,000 in 1932. The total for the year is broken down into the following estimates, with 1932 estimates in parentheses: Residential construction, \$249,000,000 (\$281,000,000); public works, \$1,533,000,000 (\$1,918,000,000); other private construction, \$658,000,000 (\$640,000,000).

The construction contracts actually reported by the *Engineering News-Record* during the year and upon which the estimates in the previous paragraph are based indicate that waterworks, earthwork, and waterways, and industrial buildings were the factors that prevented a far more serious drop in general construction activities. These items showed a gain over the figures of the previous year, as shown by the accompanying tabulation.

CONSTRUCTION CONTRACTS REPORTED IN 1933
[*Engineering News-Record*]

(In thousands of dollars)			
	1933	1932	
Waterworks	67,263	34,586	
Sewers	22,175	24,613	
Bridges, public	80,890	79,557	
Earthwork and waterways	136,575	101,251	
Streets and roads	288,258	379,937	
Buildings, public	121,161	240,627	
Unclassified, public	22,817	38,014	
Total, public	739,139	898,585	
Bridges, private	16,941	4,275	
Buildings, industrial	152,376	93,064	
Buildings, commercial	105,399	166,296	
Unclassified, private	53,514	57,089	
Total, private	329,230	320,724	
Total	1,068,369	1,219,309	

By geographical sections the foregoing construction expenditures were distributed as follows:

	1933	1932	Percentage gain or loss
New England	58,594,000	71,636,000	-19.5
Middle Atlantic ..	298,481,000	403,830,000	-26.0
South	123,988,000	127,815,000	-3.0
Middle West	150,693,000	205,423,000	-26.5
West of Mississippi	225,295,000	236,205,000	-4.5
Far West	211,318,000	174,400,000	+21.0

Though the figures just given show a percentage gain or loss in one year's activity they give force to another comparison drawn by the same authority of the swing of construction from the East to the South and West. Whereas four years earlier, in 1930, more than 40 per cent of the total construction was carried on in the Middle Atlantic States, that percentage has been steadily dwindling to a total of 28 per cent in 1933. Conversely in the seven States comprising the Far West Division, the percentage of total construction has risen from 10.8 per cent to 21.1 per cent; in the ten States comprising the division West of the Mississippi, from 15.4 per cent to 21.1 per cent; in the eleven States of the South, the rise has been less conspicuous, from 8.6 per cent to 11.6 per cent.

Loans and grants from the Reconstruction Finance Corporation and the Public Works Administration supplied the funds for the greater percentage of construction during the year. Bonds

purchased by these two agencies in 1933 in addition to those sold by States and municipalities in the open market and allotments made by the P.W.A. for which bonds had not been purchased, brought the total of financing of public construction to \$1,090,700,000. Private financing, aside from that through the agency of P.W.A. loans, amounted to less than \$55,000,000; but construction projects under private operations were allotted P.W.A. funds amounting to \$237,322,000, of which \$182,808,000 was lent to railroads, \$5,942,000 to other corporations, and \$48,572,000 for housing. About two billion dollars of the P.W.A. fund of \$3,300,000,000 was allotted to Federal agencies. The *Engineering News-Record* divides these allotments as: \$562,000,000 for straight construction work, \$100,000,000 for Federal housing projects, and \$800,000,000 to projects that border on construction work but cannot be considered strictly as such, such as the projects under the Civil Works Administration, shipbuilding, and the geological survey.

Of the three basic materials of construction, lumber production showed an increase of 28 per cent over the previous year, with a price increase at the close of the year about 50 per cent above that of the close of 1932. Cement output fell to about 79 per cent of the 1932 output, and shipments of fabricated structural steel dropped to 833,372 tons, or about 88 per cent of the production for 1932.

BUKA. See NEW GUINEA.

BULGARIA. A constitutional monarchy in the Balkans. Capital, Sofia. King in 1933, Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918.

AREA AND POPULATION. With an area of 39,825 square miles, Bulgaria had an estimated population in 1932 of 6,128,000 (5,478,741 at the 1926 census). In 1931 living births numbered 170,950; deaths, 98,192; marriages, 55,555. In 1932 the birth rate per 1000 was 31.3 (29.3 in 1931); death rate, 16.2 (16.8 in 1931). Bulgarians constitute about 81 per cent of the total, Turks about 10 per cent. The chief cities, with the 1926 census populations, are: Sofia, 213,002; Plovdiv (Philippopolis), 84,655; Varna, 60,563; Russe (Rus-chuk), 45,788.

EDUCATION. Primary education is free and compulsory. In 1931-32 there were 677,673 pupils in elementary schools, 202,273 in secondary schools, 27,990 in special and professional schools, 9914 in universities. There is a large state university at Sofia.

PRODUCTION. Eighty per cent of the population is engaged in agriculture, the 8,994,000 acres of arable land and 776,000 acres of pasture being widely distributed among small proprietors. Yields of the chief crops (1000 bushels, except as indicated) in 1932, with 1931 returns in parentheses, were: Wheat, 50,553 (63,830); rye, 10,136 (10,653); barley, 14,102 (15,862); oats, 7777 (7060); corn, 41,511 (34,989); mixed grain, 95,000 metric tons (141,000); potatoes, 3583 (2570); tobacco, 31,212,000 pounds (54,784,000); grape must, 69,318,000 gallons (74,179,000); sugar beets, 184,000 metric tons (201,000); beet sugar, 27,000 tons (25,000); sunflower seed, 177,027,000 pounds (256,878,000); attar of roses, 67,000 ounces (68,000).

Output of the State-controlled tobacco industry in 1932 was 7,731,000 pounds of manufactured tobacco (8,554,000 in 1931). Coal production, 1932, was 1,732,000 metric tons (1,523,000 in

1931). Copper, zinc, lead, aluminum, and salt are produced in small quantities. The industrial census of 1926 showed 197,784 industrial establishments (including home industries), with 368,022 employees.

COMMERCE. Imports in 1932 were valued at 3,471,233,000 leva (\$24,958,000), against 4,660,063,000 leva (\$33,366,000) in 1931. Exports in 1932 totaled 3,382,845,000 leva (\$24,323,000), as against 5,934,174,000 leva (\$42,489,000) in 1931. Conversions to dollars are made at the average exchange rate for the lev of \$0.00719 in 1932 and \$0.00716 in 1931. Values of the chief import items in 1932 and 1931 were: Textiles, \$9,330,000 (\$10,545,000 in 1931); metals and manufactures, \$3,886,000 (\$6,512,000); machinery and instruments, \$3,058,000 (\$4,756,000); chemicals and allied products, \$2,614,000 (\$2,815,000). Export items included: Leaf tobacco, \$7,751,000 in 1932 (\$18,471,000 in 1931); eggs, \$4,486,000 (\$6,086,000); wheat, \$3,907,000 (\$4,358,000); corn, \$2,097,000 (\$2,113,000). Germany supplied 25.9 per cent of all imports in 1932; Italy, 15.6; United Kingdom, 10.3. Germany also took 26 per cent of all 1932 exports; Italy, 12.5; United Kingdom, 2.5. Imports (1933) were 2,202,000,000 leva; exports, 2,846,000,000 leva.

FINANCE. Preliminary returns for the fiscal year ended Mar. 31, 1933, showed a deficit of 1,300,000,000 leva, with expenditures of 7,200,000,000 and revenues of 5,900,000,000 leva. In 1931-32, there was a deficit of 931,000,000 leva on expenditures of 7,365,000,000 leva; in 1930-31, a deficit of 1,847,000,000 leva on expenditures of 8,106,000,000 leva. The 1933-34 budget estimates balanced at 5,205,000,000 leva. Public debt, Dec. 31, 1932, totaled 27,413,173,000 leva (funded internal, 2,504,267,000; funded external, 20,627,580,000; floating, 4,281,336,000).

COMMUNICATIONS. The state railways, with 1650 miles of line, carried 7,680,000 passengers and 4,780,000 metric tons of freight in the year ended Mar. 31, 1932. Gross receipts were 1,149,511,000 leva (\$8,276,000). Private railway lines extended 332 miles. Highways aggregated 10,340 miles (4736 miles of state and 5604 miles of communal roads). During 1932 there entered the Black Sea ports, 6127 vessels of 2,043,948 net registered tons; cleared, 6129 vessels of 2,046,442 tons. At the Danube ports (1932) 12,537 ships of 2,285,322 tons entered; 12,575, of 2,273,223 tons cleared.

GOVERNMENT. The King is the executive authority under the Constitution of 1879. He is assisted by a council of ministers nominated by him but responsible to the National Assembly (Sobranie). The National Assembly is a single chamber of 274 members elected for four years. The composition in 1933 of the Sobranie elected June 21, 1931, was: National Bloc, 155 (including 76 Agrarians, 43 Democrats, 29 National Liberals, and 7 Radicals); Democratic Entente, 62 (including Liapcheff group, 43, and Zankoff group, 19); Labor (formerly Communist), 31; other parties, 26. The Cabinet, as reorganized Dec. 31, 1932, was headed by Alexander Malinoff.

HISTORY

DOMESTIC AFFAIRS. With agricultural prices at their lowest recorded level, the economic condition of the Bulgarian people—80 per cent of whom were dependent upon the soil—became increasingly desperate during 1933. Actual starvation was reported in both rural and urban districts. The majority of the peasants were heavily

in debt and the collection of loans was practically impossible. Currency was so scarce, especially in the rural areas, that barter was the prevailing method of exchange.

Widespread suffering among the masses was reflected in the vigorous growth of the Independent Labor (Communist) party, which won 29 seats in the Sobranie in the election of June 21, 1931, and captured control of the Sofia municipal council in the autumn of 1932. Alarmed by these gains and by aggressive Communist propaganda in the schools and the army, the government sought to repress the Communist movement. A drastic press censorship law was enacted in January, 1933. Early in April two Communist Deputies and a number of soldiers were arrested on charges of organizing Communist "cells" and spreading propaganda in the army. On April 12, the Sobranie by a large majority voted to oust the 30 Communist Deputies, leaving their seats vacant, and to bar adherents of the Independent Labor party from elective offices and public employment. Numerous arrests of alleged Communists followed and on Dec. 26, 1933, seven were condemned to death for engaging in subversive activities in the army. Eighteen others received prison terms of 5 to 15 years on the same charge.

The ousting of the Communists from the Sobranie stimulated rather than checked radical propaganda among the peasants. To prevent the growth of an educated proletariat, the government closed a number of secondary schools. University fees were raised and other restrictions imposed on higher education. The students voiced their opposition in strikes and demonstrations, while violent clashes between radical and Fascist students increased. Anxious to hold its position against both Communist and Fascist attacks, the government on Jan. 13, 1933, secured the passage of a bill granting amnesty to members of the Agrarian Cabinet of Premier Stambulisky, who fled the country following Stambulisky's overthrow in 1923.

The government faced another serious problem in the revival of the feud between the Mihailoffist and Protogueroffist factions of the Macedonian Revolutionary Organization. The conflict, marked by assassinations and street clashes in Sofia, became so acute early in 1933 that the government was urged to intervene. It hesitated to attack so thorny a problem, however. Even its half-hearted measures evoked the censure of a great Macedonian Congress, held at Gorna Djumaja in February, 1933. Meanwhile continued Macedonian raids over the Yugoslav border threatened to embroil the two governments.

On June 25, 1933, the Sofia authorities were finally moved to act by a series of assassinations. They declared martial law for one day and combed the capital with 7000 troops, searching for concealed arms. Large quantities of rifles, revolvers, bombs, hand grenades, and ammunition were confiscated and about 1200 persons were arrested. This move was not effective in checking factional strife. New clashes between the Macedonians caused the government to repeat its search on July 9.

FOREIGN RELATIONS. Bulgarian-Yugoslav relations were particularly strained early in 1933, due to Macedonian raids and other irritating incidents. However Bulgaria's need for foreign markets for her agricultural produce and Yugoslavia's fear of war with Italy or a combination of anti-treaty nations moved both countries to seek a

reconciliation. The Little Entente (q.v.) attempted to detach Bulgaria from Italy and bring it into their group. Both Yugoslavia and Rumania, as members of the Little Entente, lent a responsive ear to the Bulgarian request for less severe treatment of their Bulgarian minorities and for favorable commercial agreements. The Kings of the three countries played a leading rôle in the rapprochement of these former enemy countries and in the subsequent negotiations, which were under way at the close of the year.

The first move toward conciliation of Bulgaria and Yugoslavia was the meeting of King Boris and King Alexander at the Belgrade railway station Sept. 18, 1933, the first time they had met since the wars of 1913-18. In October King Alexander and Queen Marie of Yugoslavia visited Boris and his consort at Varna on the Black Sea and in December Boris and Giovanna paid a state visit to the Yugoslav rulers in Belgrade. On October 30, Boris and King Carol of Rumania conferred for seven hours on Carol's yacht in the neutral waters of the Danube. These moves on the part of Boris were received with hostility or scepticism by the Macedonian revolutionaries, the Liapcheff Democrats, the Smiloff Liberals and the Zankoff groups in Bulgaria. The visit of Boris in September to London and to Paris, where he conferred with high British and French officials, was interpreted as an effort to secure a foreign loan in return for a new Bulgarian orientation toward France and her eastern allies. He was said to have asked British advice on Bulgaria's foreign policy.

Premier Ismet Pasha and Foreign Minister Tewfik Rushdi Bey of Turkey visited Sofia September 21 and 22. The Bulgarians declined the Turkish invitation to adhere to the Turko-Greek treaty of friendship and nonaggression or to conclude a new Turko-Bulgarian pact modeled on the Turko-Greek treaty. The Bulgarian government's refusal was based on the contention that to do so would involve the abandonment of Bulgaria's claim to access to the Ægean Sea. Finding no closer tie possible, the two governments agreed to renew for five years the existing Turko-Bulgarian treaty, which was due to expire in March, 1934.

THE VATICAN'S PROTEST. A daughter, born to King Boris and Queen Giovanna on Jan. 13, 1933, immediately became the subject of a controversy between Boris and the Vatican. On January 15 the baby was baptized in the Greek Orthodox faith by the Metropolitan of Sofia. The Apostolic Delegate to Sofia immediately protested and on January 18 the Vatican published documents exchanged between the Pope and Queen Giovanna before the Pope gave his consent to her marriage. In the documents she promised that any children born of her union with Boris would be brought up in the Roman Catholic faith. The Bulgarian constitution provides that the King's eldest son must be Orthodox. Pope Pius XI in a consistory held March 13 deplored the baptism of the child in a non-Catholic faith, but exonerated the Queen on the ground that she had given the proceeding neither express nor tacit consent.

BURIAT-MONGOL REPUBLIC. See SIBERIA.

BURK, WILLIAM HERBERT. An American clergyman and curator, died at Valley Forge, Pa., June 30, 1933. Born in Philadelphia, Pa., Apr. 23, 1867, he was graduated from the Uni-

versity of Pennsylvania in 1890 and from the Philadelphia Divinity School in 1893. Upon his ordination as a priest of the Protestant Episcopal Church in 1894, he was appointed rector of the Ascension Church, Gloucester City, N. J., and during the next three years served as assistant rector of St. John's Church, Norristown, Pa. While rector of All Saints Church at Norristown he became interested in the project of a national shrine at Valley Forge as a memorial to Washington's faith during the trying winter of 1777. In 1903 he founded there the Washington Memorial Chapel and in 1911 was chosen its rector. The Gothic chapel which was erected under his direction has long been known as "The Shrine of American Patriotism." There was established in connection with it the Valley Forge Museum of American History, of which he was curator.

Dr. Burk was also founder and president of the Valley Forge Historical Society, and a member of the Valley Forge Park Commission (1923-29). His more ambitious project of erecting at Valley Forge a \$10,000,000 Washington National Memorial Church, to be the Westminster Abbey of America did not materialize on account of the opposition of the Bishop of the Diocese. In 1928 he received the Philadelphia civic award of \$10,000 for service advancing the best interests of that city. Among his writings about the region were *The Shrine of Washington at Valley Forge* (1905) and *Historical and Topographical Guide to Valley Forge* (1906-29).

BURLESON, THE RT. REV. HUGH LATIMER. An American clergyman, died at Camp Remington, Black Hills, S. D., Aug. 1, 1933. He was born at Northfield, Minn., Apr. 25, 1865, and was graduated from Racine College in 1887 and from the General Theological Seminary in 1893. On his ordination to the Protestant Episcopal priesthood in 1894 he served until 1898 as rector of St. Mark's Church at Waupaca, Wis., and until 1900 as assistant at St. Luke's Church, Rochester, N. Y. During the seven years following he was dean of Gethsemane Cathedral in Fargo, N. D. In 1909 he was appointed secretary of the Domestic and Foreign Missionary Society of the Protestant Episcopal Church, serving also during 1913-16 as editor of *The Spirit of Missions*. Following his election as Missionary Bishop of South Dakota in 1916, he devoted his energies particularly to advancing the material and spiritual interests of the Sioux Indians of his district.

Bishop Burleson served after 1925 as assessor or assistant to the President Bishop of the Protestant Episcopal Church. In 1931 he resigned his see so as to devote his entire time to his administrative duties with the National Council in New York City. He wrote *The Conquest of the Continent* (1911) and *Our Church and Our Country* (1918).

BURMA. A province in the easterly part of British India bounded on the east by China, French Indo-China, and Siam. The total area is 262,732 square miles divided as follows: Burma proper, 184,102 square miles; the Shan States, 62,305 square miles; and 16,325 miles of unadministered territory. Population (1931 census), 14,667,146; Rangoon, the capital city, had 400,415 and the city of Mandalay had 147,932. In religion the census of 1931 showed that over 84 per cent of the people were Buddhists. The native races belong to the Mongolian group and they

have little in common with India proper in language, race, or religion. In 1931-32 there were 525,013 students in 7303 recognized schools and colleges, and 202,393 students in unrecognized institutions. There is a university at Rangoon; an agricultural college, a research institute, and an intermediate college, at Mandalay; a forestry school at Pyinmana; and a technical institute, and a veterinary school, at Insein near Rangoon.

PRODUCTION. At the 1931 census agricultural cultivation was recorded as being the principal occupation of 4,127,772 persons, and the subsidiary occupation of 118,725 persons. The production of rice and rice products for 1932-33 was 12,142 million lbs., and the surplus available for export in 1933 was estimated at 7728 million lbs. The area under rice in 1932-33 was estimated to be 9,622,400 acres. Paddy prices (unmilled rice) on March, 1933 reached the low of 55/56 rupees per 100 baskets. Reserved forest land at the end of the year 1930-31 amounted to 29,834 square miles from which the output of teak for the year totaled 309,279 tons. The petroleum production was 243,914,568 Imperial gallons. Mineral production in 1931 was tin, 2436 tons; tungsten ore, 940 tons; and silver, 5,900,400 ounces. Factories in 1931 numbered 947 and the total number of persons employed was 90,593.

COMMERCE. In 1932, exports to foreign countries were valued at 226,974,000 rupees, and to the rest of India were valued at 266,954,000 rupees; imports from foreign countries were valued at 111,136,000 rupees, and from the rest of India at 109,502,000 rupees (rupee averaged \$0.2635 for 1932).

FINANCE. Revenues for 1931-32 totaled 103,200,000 rupees; expenditures, 92,500,000 rupees. The provincial government made no contribution to the central government in 1931-32. From the forests the net surplus amounted to 5,000,000 rupees.

COMMUNICATIONS. Owing to the rugged nature of the eastern and northern frontiers, communication with India and the outside world is entirely by water. Most of Burma's imports and exports pass through Rangoon, situated about 20 miles from the sea on the Rangoon River. The great river Irrawaddy is navigable as far as Bhamo, 900 miles from the sea, and forms the main highway of commerce; the Chindwin, its tributary, is navigable for 300 miles. In 1931-32 there were 2057 miles of state-owned railway open to traffic. Surfaced roads extended 1982 miles; unsurfaced roads, 7696 miles.

GOVERNMENT. In 1923, Burma was constituted a Governor's Province under the government of India Act of 1919. There is an appointive executive council and a legislative assembly of 103 members, of whom 80 are elected and 23 nominated and *ex-officio*. The Shan States are administered by the local chiefs under the supervision of the Commissioner of the Federated Shan States. The government moves from Rangoon to Maymyo during the hot weather season. Governor in 1933, Sir H. L. Stephenson.

HISTORY. The Round-Table Conference on Burma, held in London from Nov. 27, 1931, to Jan. 12, 1932, had envisaged the separation of Burma from India and the granting to Burma of a Constitution extending greater autonomous powers. Progress toward this goal was delayed during 1932 and 1933 by the development of a movement in Burma opposing separation from India unless Burma first secured a greater degree of self-

government than that proposed by the British. The Anti-Separationist party urged Burma's entrance into the proposed Indian Federation, holding that Burma could then secede from the Federation with greater autonomous powers than those to be conferred by the proposed Constitution. British spokesmen made it plain that if Burma entered the Indian Federation it could not withdraw later. Nevertheless the Anti-Separationists won a majority in the provincial legislature in the elections of November, 1933.

In August, 1933, Sir Samuel Hoare, British Secretary of State for India, made public a new scheme of constitutional reform for Burma, separated from India. The proposals were modeled on the governmental setup of the Indian Federation as proposed by the Parliamentary Joint Select Committee on Indian Constitutional Reform. Early in December the Burmese delegates to the Joint Select Committee arrived in London to discuss the British government's constitutional proposals. These discussions continued to the end of the month. Dr. B. A. Maw, one of the Anti-Separationist leaders, told the committee that even if no right of secession from the Indian Federation were granted, his group would continue to demand federation with India. See INDIA under *History*.

BURNHAM, HARRY LAWSON WEBSTER LAWSON, 1st VISCOUNT. A British journalist, died July 20, 1933, in London, where he was born Dec. 18, 1862. Educated at Eton and Balliol College, Oxford, he became associated in London with his father, the 1st Baron Burnham (Edward Levy Lawson, 1833-1916), in the direction of the *Daily Telegraph*, acquired by his grandfather, J. M. Levy, from Colonel Sleigh in 1855. By a reduction in price to one penny and by giving attention to special correspondence in peace and war and to theatrical, musical, literary, and social news it became the favorite newspaper of the English middle class. He represented the *Telegraph* as special correspondent in South Africa during the Boer War and later in India. On his father's retirement in 1903 he succeeded to the sole direction of the paper, holding the proprietorship until its sale in 1927. In recognition of his service as chairman of the Newspaper Conference, responsible for the regulation of news during the World War, he was created a Companion of Honor of the British Empire. From 1916 to 1928 he was president of the Empire Press Union, presiding over the Imperial Press Conferences held in Ottawa, Canada, in 1920 and in Melbourne, Australia, in 1925.

Until he took his seat in the House of Lords in 1916 Lord Burnham represented, as a Unionist, various constituencies in the House of Commons. These included West St. Pancras (1885-92), East Gloucestershire (1893-95), and the Mile End division of Tower Hamlets (1905-06 and 1910-16). He was also a member of the London County Council from 1889 to 1892 and again from 1897 to 1904 and was mayor of Stepney during 1908-09. In the House of Lords he was a member of the committee which drafted the Electoral Reform Act of 1918 and of the committee which secured recognition of the powers of the Second Chamber. He also served as chairman of the Standing Joint Committees of Education Authorities and Teachers which drew up the new scales of teachers' salaries in Great Britain, known as the Burnham scales; deputy chairman of the Empire Parliamentary Association; and

member from 1927 to 1930 of the Indian Statutory Commission, appointed to investigate the workings of the Montagu-Chelmsford plan of local self-government in India.

An advocate of internationalism, Lord Burnham presided over the International Labor Conferences held in Geneva in 1921, 1922, and 1926 and over the Public Health Congresses held in Bordeaux, France, in 1924 and in Ghent, Belgium, in 1927. After 1929 he was president of Birkbeck College, University of London. Among the honors bestowed on him were Knight of the Grand Cross of St. Michael and St. George, Commander of the French Legion of Honor, Commander of the Order of Leopold of Belgium, and Grand Officer of the Star of Rumania. Also he received the Grand Cross of the Crown of Italy, Grand Cross of the Order of the Redeemer of Greece, and Grand Cross of the Order of the Star of the North of Sweden. He was created a Viscount in 1919.

BUSINESS IMPROVEMENT. See RAILWAYS.

BUSINESS REVIEW. In few recent years has the history of business been more chequered than during 1933. The opening of the twelve-month was marked by an extremely low morale, and low volume, of trade and of production, while employment was likewise at low ebb. This situation was fairly general throughout the world but was doubtless aggravated in the United States by the fact that the change of Administration and the uncertainty what the new management of Federal affairs would do tended to make the doubt regarding current conditions deeper than would otherwise have been the case. Banking conditions (see article on BANKS AND BANKING) had grown alarming, and had their reflex influence upon trade generally, particularly in view of the doubt and difficulty which seemed to attend upon the getting of loans at many institutions. A second phase of the situation opened toward the beginning of April, when a revival set in, both in Great Britain and in the United States, due largely to natural rebound from extreme depression accompanied in this country by the belief that what had been viewed as a "do-nothing policy" was over and that a more active management of affairs was about to inaugurate reforms. Hence a marked revival of activity, particularly in textiles and some other allied lines, previously distinctly depressed. This period of activity continued well into mid-summer. It was succeeded by a third period, lasting practically throughout the remainder of the year, in which gradual recession and reaction were characteristic. During its early months, the new National Administration had accepted two outstanding policies: (1) that of inflating the credit of the country and (it was feared by some) the currency system; and (2) that of reorganizing industry under what was termed the National recovery system, a plan providing for joint control of hours, wages, and output by committees representing labor and capital as well as the Government. The higher costs resulting from shortening of hours and raising of wages, were to be met by corresponding increases of price, but, the public proving unwilling to pay such advances, the higher charges tended to cut off the larger demand of the summer months and so to reduce the increase in manufacturing, although it continued on a level rather better than that established during the latter part of the preceding year. In-

flation, on the other hand, at first operated to create an optimistic state of mind, with many persons predicting great paper profits as the result of higher prices for goods which, it was asserted, would follow upon the depreciation of the dollar as that was brought about under the plans of the Administration. The outcome, in this regard, proved disappointing, for increases in prices, though substantial, proved unstable and inconstant, and in no case corresponding to expectation, while the stimulating effect of inflation upon investments proved limited, and was shortly lost—at least in very large measure. All in all, the business results of the year were thus far from meeting expectations, either on the part of politicians or of business men.

In the accompanying table, is reviewed the general composite business situation from the production standpoint, as exhibited by the Federal Reserve Board's Index.

INDEX OF INDUSTRIAL PRODUCTION

DISTRIBUTION. Distribution, partly as a result of unemployment, partly owing to the belief that commodity prices, which had long moved steadily downward, would go to even lower depths, had operated severely against both retail and wholesale trade during the year 1932. At the beginning of 1933, many distributors were almost in despair, and there was a prevailing opinion that an advance of prices would immensely help toward rectifying the whole situation. The policies initiated by the Roosevelt Administration were confessedly based upon an intent to advance prices, while the inflation efforts of one kind and another, suggested or initiated by the incoming politicians, doubtless tended to further such an advance, at least psychologically. More influential still, was the fact that many commodities had probably reached the low point in their downward cyclical movement, and were about to react upward, owing to partial exhaustion of supplies, higher costs of production, or other factors. The early part of 1933, with its larger pay-rolls and greater employment opportunities, due to the broadening of manufacturing, distributed consuming power, and made the mid-year a time of distinct improvement in all sorts of business, particularly retail. Betterment of retail trade continued long after the reaction in manufacturing had again set in, and carried well up to the close of the calendar year. Foreign demand suffered for special reasons, elsewhere reviewed, but domestic distribution was improved, as may be seen from the department store indexes reflecting buying at selected establishments during the twelvemonth as shown in the accompanying table.

Adjustment for seasonal variation makes allowance in March and April for the effects upon sales of changes in the date of Easter

COMMODITY PRICES. It was in the direction of improvement of commodity prices that much of the new policy of the Federal Administration was directed from the opening of the year, and it was in this particular field that most of the complaint of former years had been concentrated. Accordingly, the movement of prices during the year 1933 was under closest scrutiny from the very first. However, a comparison of indexes for the year as a whole, shows comparatively little net result. At wholesale, i.e. for staples such as wheat, corn, and cotton, the year at times showed striking movements but much of these advances was not able to be maintained save sporadically and in a tentative fashion so that the end of the period found them on the whole better off (about 10 points) than at the beginning but still far from the level of 1926. At retail the early prices of the year had not suffered so great a fall as the wholesale, and accordingly were less subject to rebound. The loud, and nation-wide, call for higher prices and the encouragement, as well as the impetus, given to price-raising by the National recovery programme brought a general effort to advance prices especially at retail, during the latter part of the year, but proved largely futile, owing to the fact that purchasing power had evidently not grown *pari passu*—in like proportion—with nominal charges, so that eventually many of the higher rates for goods had to be rescinded if sellers did not wish to be left overstocked. This, toward the close of the year actually brought about the anomalous condition that in some lines retail prices were lower than the corresponding wholesale

prices fixed for the same industries under Government supervision.

* Preliminary

MANUFACTURING. The year 1933, as already incidentally indicated, was more than usually "spotty" in manufacturing, as the indexes for the successive months show. During the early months of the year, general depression and inactivity had caused extreme discouragement and pessimism among large classes of the population, and particularly among producers who found it necessary to have large turnover ("mass-production") in order to cover expenses. This period was followed by several months of good demand, large output, and rising profits, so that not a few enterprises were able, for the first time in some years, to show improvement in balance-sheet condition.

Improvement occurred in automobile manufacturing, and during the middle of the year in steel and allied industries. Farm implement makers found demand better than for some time past. Textile producers enjoyed something like a "boom." Industries which were already provided with large stocks of raw material acquired during the years of exceptionally low prices for basic commodities, found the situation particularly conducive to growth of profits. There was a general tendency toward expansion, in the belief that something like the business conditions of 1928 was about to return. This confidence was rudely broken in upon by the large advances in wages and other costs, due to the recovery administration's programme, and the increases in price of imported materials growing out of the high cost of foreign currencies (in dollars) caused by depreciation of the dollar. There was a sharp reduction of productive activity, and steel, which had shown a large increase in occupied capacity, fell to 25 per cent during November. The following table, reproducing the unfilled orders of the United States Steel Corporation reflects the dif-

UNFILLED ORDERS

[U. S. Steel Corporation]

Month	Tons 1933	Tons 1932	Tons 1931
January	1,893,644	2,648,150	4,132,351
February	1,854,200	2,545,629	3,965,194
March	1,841,002	2,472,413	3,995,380
April	1,864,574	2,326,926	3,397,729
May	1,929,815	2,177,162	3,620,452
June	2,106,671	2,034,768	3,479,323
July	2,020,125	1,966,302	3,404,816
August	1,890,444	1,969,595	3,169,457
September	1,985,090	1,985,090	3,144,833
October	1,997,040	1,997,040	3,119,432
November	1,968,301	1,968,301	2,993,891
December	1,968,140	1,968,140	2,795,353

The low point reached by Steel's backlog earlier in the year was at the end of March when only 1,841,002 tons of unfilled orders remained on the books of the corporation. This figure represented at the time the lowest reserve of orders since the corporation was founded in 1901.

ferent stages of development during the year. At the opening of November, the Steel Corporation announced the termination of its old practice of making known these orders monthly, notwithstanding its long standing and the importance generally ascribed to the orders as a business index. In place of such figures the Steel Corporation proposed to substitute a regular report of "occupied capacity."

The accompanying tabulation shows the monthly shipments of the United States Steel Corporation since the beginning of 1930.

MONTHLY SHIPMENTS, 1930-1933
[U. S. Steel Corporation]

Month	Tons 1933	Tons 1932	Tons 1931	Tons 1930
January ..	285,138	426,271	800,031	1,104,168

AGRICULTURE. The farmer who, for years past, had been the constant source of solicitude for every National Administration had at the close of 1932, reached a condition which was in many respects desperate. Not only was he suffering from continuously low and falling prices, but he was also finding his current money return below costs of production as well as often insufficient to meet his current necessary outlays for actual expenses and for local taxation to say nothing of interest on borrowings. This situation was most prevalent in the twelve north central States where the findings of the Department of Agriculture had shown that about 60 per cent of the farm mortgages of the nation were concentrated, but it fairly reflected real trouble in many other regions. The new Administration accordingly set itself to relieve the farmer, not only by artificially advancing his prices, but also by making arrangements for a forced reduction of acreage, whereby the farmer in certain staple industries was to be paid for acreage left untilled. Compensation was to be made out of taxes levied on consumers of these products, and further relief was provided by plans for mortgage assistance and refunding, with Government aid. Loans on cotton and wheat at fixed artificial values were provided. Agriculturally, the year was productive, and in spite of all the Government could do in cutting acreage—at a cost of \$113,000,000 in cotton alone—cotton turned out 13,177,000 bales or about 175,000 more than the year before, while wheat which was less favored by climatic conditions, yielded a total of 514,000,000 bushels. Animal husbandry, though aided by Government purchases, was also productive and prices continued low while for wheat and cotton advances were sporadic and insufficient, wheat closing the year at \$1.02½ (No. 2, Red) per bushel in New York and cotton at 10.3 cents per lb. The accompanying table affords a general view of the year's yields.

U. S. AGRICULTURAL PRODUCTION, 1933

Product	Production	Value
Cornbushels	2,330,237,000	\$917,605,000
Wheatdo..	527,418,000	357,525,000

Cottonbales.	13,177,000	617,716,000

GENERAL BUSINESS. Starting with a low level of industrial earnings and with a record of widespread suspension and reduction of dividends, the business community had a favorable basis of annual comparison. With this in mind, the results of the year 1933 must be regarded as comparatively successful. Many concerns were able during the active mid-year period to pull themselves "out of the red"; and, in some cases, to restore surpluses or resume dividends. In other cases, the desire to conserve cash led enterprises to refrain from larger distributions to stockholders, but they were able to issue much more favorable earnings reports. These conditions partly accounted for the upswing in the stock market and were the more encouraging in view of the fact that foreign trade continued its decline early throughout the year. Public utilities, including the railroads, telegraphs, and telephone companies, were able to improve their showing in a material degree. Manufacturing enterprises, in many cases, distinctly improved their balance-sheet position. These gains, however, were largely concentrated in the second and third quarters of the year, and recession occurred during the final quarter. Possibly, the most encouraging element in the case during the bulk of the year was the fact that not a few industries were able, by economies and elimination of waste, to adjust themselves to what seemed to be the more or less permanent conditions growing out of the changes in industry resulting from the depression. Unfortunately many of the latter type of gains had to be sacrificed under the new National recovery requirements.

BUSINESS FAILURES. Business failures, like other indications of commercial condition, were modified by extraneous influences which gave rise to new alignments. As during 1932, the Government was extremely desirous to reduce the severity and number of business failures, and it, early in the new Administration, sought additional measures for the attainment of that end. The most outstanding was the widespread application of the new National bankruptcy measure adopted in 1932 and now administered with great leniency. Banks compelled to close during the National bank holiday were usually placed in the hands of conservators instead of in those of receivers, while railroads were, in some cases, treated in a similar way and in other cases, actual failure, when unavoidable, was accompanied by very lenient conditions. The result was that in not a few cases, creditors who would otherwise have insisted upon receiverships or bankruptcy in given instances, were disposed to refrain from taking the steps necessary to bring about either of these steps and permitted compositions or adjustments with creditors to be made in order to protect their own interests at least to some small extent. Accordingly, actual

statistics of failures for 1933 were not particularly enlightening as contrasted with former years. They are, however, given in the accompanying table following "Dun and Bradstreet's, Inc." annual compilations which have superseded those of "Bradstreet's" through consolidation of the two sources. The figures would in ordinary circumstances for reasons just reviewed, have been much larger, as well as differently distributed, and conclusions based upon them must therefore be received with reservations.

TOTAL NUMBER OF COMMERCIAL FAILURES IN THE UNITED STATES, WITH LIABILITIES, FOR FOURTEEN YEARS, AS REPORTED TO DUN AND BRADSTREET'S, INC.

Year	Number	Liabilities	Average liabilities
1933	20,307	\$502,830,584	\$24,761
1932	31,822	928,312,517	29,172
1931	28,285	736,309,102	26,032
1930	26,355	668,283,842	25,357
1929	22,909	483,250,196	21,094
1928	23,842	489,559,624	20,533
1927	23,146	520,104,268	22,471
1926	21,773	409,232,278	18,795
1925	21,214	443,744,272	20,918
1924	20,015	543,225,449	26,351
1923	18,718	539,386,806	28,818
1922	23,676	623,896,251	26,351
1921	19,652	627,401,883	31,926
1920	8,881	295,121,805	33,230

The total indebtedness involved in insolvencies for 1933 was \$502,830,584 which was 84.3 per cent below the total of \$928,312,517 reported for 1932. Of the 13 years, 1921-33, in which insolvencies have been high and liabilities heavy, there were 8 in which the amount of indebtedness reported for each year was in excess of that shown for 1933.

BUSTAMANTE, DANIEL SÁNCHEZ DE. A Bolivian statesman, died in Buenos Aires, Argentina, Aug. 5, 1933. Born at La Paz, Bolivia, in 1871, he received his education at the university there and was admitted to the bar in 1890. The following year he entered public life as chief clerk in the Department of the Treasury. He later became a member of the Chamber of Deputies (1894-1900), assistant secretary of government (1901), and professor of law at the Universities of Sucre and La Paz. Commissioned by the government in 1904 to study the educational systems of European countries, he was appointed in 1908 Minister of Public Instruction in the cabinet of President Montes and was largely responsible for the passage in Congress of the plan by which the educational system of Bolivia was reorganized. He founded also the first normal school at Sucre and the national school of commerce at La Paz.

In 1909 Dr. Bustamante was appointed Minister of Foreign Affairs in the cabinet of President Villazón and played a prominent part in the boundary settlement with Peru. After again holding the portfolio of Public Instruction in President Guerra's cabinet (1918-20), he served as Minister to Chile, devoting his energies in particular to obtaining an outlet to the sea for Bolivia. During 1927-28 he attended as a member of the joint commission the conferences held in Buenos Aires in an attempted settlement of the Chaco dispute with Paraguay. On the election of Dr. Daniel Salamanca as president in 1931 he was appointed for a second time to the post of Minister of Foreign Affairs but was named later in that year Minister to Argentina. He served in the latter capacity until a few months before his death. Among his works were: *Principios de*

Derecho (1901); *Opiniones y discursos* (1904); *Los conflictos internacionales y el Panamericanismo* (1917); and *Bolivia, su estructura y sus derechos en el Pacífico* (1919).

BUTTER. See DAIRYING.

BYRD, REAR ADMIRAL RICHARD E. See POLAR RESEARCH.

CABINET, UNITED STATES. See UNITED STATES under Administration.

CALIFORNIA. POPULATION. The population of the State on Apr. 1, 1930, was 5,677,251 (Fifteenth Census); in 1920 it was 3,426,861; in 1933 (Federal estimate), 6,002,000. Sacramento, the capital, had (1930) 93,750 inhabitants; Los Angeles, 1,238,048; San Francisco, 635,394.

AGRICULTURE. The following table shows the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges . . .	1933	32,547,000 ^a	32,547,000 ^a	\$34,174,000
	1932	33,827,000 ^a	33,827,000 ^a	\$3,827,000
Grapes	1933	1,559,000 ^b	1,559,000 ^b	25,000,000
	1932	1,926,000 ^b	1,926,000 ^b	20,765,000
Hay (tame) . .	1933	1,720,000	3,997,000 ^b	\$1,102,000

Corn	1933	100,000	2,800,000	1,736,000
	1932	95,000	2,660,000	1,250,000

^a Boxes. ^b Tons. ^c 100-lb. bags. ^d Bales.

MINERAL PRODUCTION. The State continued in 1932 to produce about one-fifth of the country's output of petroleum. In addition to the minor quantities diverted to other uses, there were sent to the stills, for refining, 164,737,000 barrels of petroleum (1932), as against 173,008,000 for 1931. The position of the petroleum industry was improved by an increase of prices for most of the light grades by about one-third on June 26, 1932. The whole production of petroleum in California, for 1932, was stated as 178,128,000 barrels, which was 10,702,000 less than that for 1931. The chief producing fields, named in the order of quantity produced, were the Long Beach, the Santa Fe Springs, the Kettleman Hills, and the Midway-sunset. The Kettleman Hills field was held down by rigid proration. Comparatively little new drilling was done in 1932.

Some 35 fields in the State yielded, in 1932, 276,877,100 M cu. ft. of natural gas, of which more than half was sold to utility companies, etc. The quantity of natural gas allowed to escape into the air, and thus be wasted, was greatly reduced, to 17,510,900 M cu. ft. for 1932, as against 247,477,000 M for 1929; the improvement resulted from extension of facilities for distribution. The production of gasoline from natural gas attained 545,000,000 gallons for 1932, as against 680,300,000 for 1931. The decline was attributed, in large part, to proration in fields producing both petroleum and natural gas.

The value of the gold, silver, copper, lead, and zinc mined in 1933 was estimated to be \$12,473,351. In this estimate, gold was still figured at the old statutory value of \$20.67 an ounce; accordingly the estimated 592,400 ounces of the year's gold product accounted for \$12,245,995 of the above value. As the government, over a part of the year, paid prices above the old statutory figure, the actual receipts for gold mined in 1933 were estimated to exceed the total value at the old statutory price by \$1,971,600.

The value of the 1932 production of gold (\$11,774,677) furnished all but 2 per cent of the value of all metals mined in California in 1932. Small-scale mining among unemployed individuals supposed to number 30,000 brought in about \$493,000 in gold during 1932 in lots averaging \$41. It did not greatly augment the State's total production of gold, but added something to the income of many people lacking regular support.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$84,755,299 (of which \$29,548,945 was for local education); for conducting public-service enterprises, \$1,840,802; for interest on debt, \$5,927,252; for permanent improvements, \$41,748,893; total, \$134,272,246 (of which \$35,659,186 was for highways, \$7,931,450 being for maintenance and \$27,727,716 for construction). Revenues were \$118,896,700. Of these, property and special taxes furnished 8.5 per cent; departmental earnings and compensation to the State for officers' services, 5.6; sale of licenses, 67.1 (in which was included a gasoline sale tax that produced \$26,734,178). Funded debt outstanding on June 30, 1932, totaled \$143,890,844, of which \$57,625,000 was for highways. Net of sinking-fund assets, the debt was \$142,444,984. The State levied in the year no general ad-valorem taxes on property.

EDUCATION. The number of persons of school age in the State, as of October, 1930, the latest time of available data thereon, was reported as 1,383,650. It exceeded the number of enrolled pupils for the academic year 1932-33, which was 1,345,889. Of those enrolled, 74,447 were in kindergartens; 769,940 in elementary schools (grades 1-8, inclusive, in elementary schools and grades 7-8 in junior high schools), and 501,502 in high schools (grades 9-10 in junior high and grades 9-14 in high schools). During the school year 1932-33, the amount of money expended for education in elementary and high school districts was \$116,819,686. This was a considerable reduction from the year 1931-32. During the school year, 1931-32, the average salary paid to full-time teachers in kindergartens was \$1347; in elementary schools, \$1825; in junior high schools, \$2400; in high schools, \$2499. These are the latest figures available.

LEGISLATION. The Legislature, in regular session, passed a measure calling for the election of 22 delegates (20 by Congress districts and 2 at large) to hold a convention and act for the State with regard to ratifying the proposed repeal of the Federal Eighteenth Amendment. By its own action the Legislature gave the State's ratification to the proposed Federal child-labor amendment.

Among measures of relief for the inhabitants of the State the most conspicuous enactment was a moratorium on the payment of the installment due April 20 on property taxes, which was

postponed until June 20; exception was made of San Francisco, which owing to a new charter requiring the city to run on a cash basis was allowed to collect half of the delayed installment on April 20 and the rest before June 20. Another measure authorized irrigation districts to waive temporarily all taxes for revenue to serve their bonds. At the same time, State taxation was increased in divers ways. A constitutional amendment was submitted to popular vote; it permitted the transfer of non-operating properties of public utilities to local assessment rolls and empowered the Legislature to tax realty directly in the proportion of one-fourth of State appropriations. A sale tax of $2\frac{1}{2}$ per cent was enacted. An income-tax measure was passed but vetoed. The franchise tax on corporations was lowered, but the allowance made thereon for property taxes paid was abolished. Business trusts of the Massachusetts type, doing business in the State in the manner of corporations, were made subject to the franchise tax. See *Political and Other Events* below.

A State constitutional amendment was proposed, to permit development of State water resources at an expenditure of \$160,000,000 for the initial projects, for which the money was to be raised by bonds. Authority was granted to create municipal utility districts. In the realm of industrial legislation were passed a tax of 8 cents a pound on oleomargarine, a prohibition of the use of foreign materials in contracts for public works, establishment of a 5-day week for State employment, so far as practicable in the Governor's judgment, invalidation of "yellow dog" labor contracts (binding the worker not to enter a union), and provision for housing the poor by means of limited-dividend corporations and "community land chests." The penalty for kidnapers who killed or mutilated victims was made death or life imprisonment without benefit of parole. Advertising structures near highways outside of cities were subjected to State regulation.

A special session was held in July to balance the State budget, partly by use of tax powers ratified by the popular vote of June 27.

POLITICAL AND OTHER EVENTS. Exchanges and banks were closed on March 2 by proclamation of a period of legal holidays by Governor Rolph. An election was held on June 27, at which delegates favoring the repeal of the Federal Eighteenth Amendment were chosen to constitute a State convention, by a popular vote of about 3 to 1. A body advocating prohibition had previously sought without success to prevent the popular vote by court proceedings. At the same election the people voted the establishment of the parimutuel system of betting at racetracks, thus adopting it over Governor Rolph's previous veto of a Legislative measure. The constitutional amendments as to taxation, submitted by the Legislature, were adopted.

Los Angeles and neighboring communities, especially Long Beach, sustained serious damage and the loss of 60 or more lives in a series of earthquake shocks on the evening of March 10. Work was begun on May 24 on the Los Angeles aqueduct, designed to bring water to the city from the Boulder Dam on the Colorado River, some 300 miles away, at a cost of \$300,000,000. The city's prohibition ordinance was repealed by popular vote on May 3. A loan of \$22,800,000 from the Reconstruction Finance Corporation

to the water and power department of Los Angeles was authorized, for work in connection with the Boulder Dam project.

Thomas J. Mooney, in prison on conviction of complicity in the bomb explosion on the occasion of the preparedness-day parade in San Francisco in 1916, and the subject of a long agitation for his release, was admitted to trial at San Francisco, not on the original charge, but on a second indictment that had never been tried. He was acquitted by a jury on May 24, in a directed verdict, the prosecution having declined to present evidence. He was, however, returned to San Quentin prison. The area of Death Valley, including 1,601,800 acres, was made a National monument by Presidential proclamation in February.

A mob at San Jose battered its way into the jail on November 26, seized two kidnapers of whom one had confessed to slaying the victim, and hanged both men in the neighboring park. Governor Rolph aroused criticism from many sections of the nation by a statement praising the mob's act. See the article LYNCHINGS.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, James Rolph, Jr.; Lieutenant-Governor, Frank F. Merriam; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney General, U. S. Webb; Director of the Department of Agriculture, Dudley Moulton; Superintendent of Public Instruction, Vierling Kersey.

Judiciary. Supreme Court: Chief Justice, William H. Waste; Associate Justices, William H. Langdon, John W. Preston, Jesse W. Curtis, Emmett Seawell, John W. Shenk, Ira F. Thompson.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher learning with headquarters at Berkeley, Calif., founded in 1868. Branches are found in various parts of the State. At Mt. Hamilton is the Lick Observatory; at San Francisco, the California School of Fine Arts, Hastings College of the Law medical school, the George Williams Hooper Foundation for Medical Research, college of dentistry, California College of Pharmacy; at Los Angeles, the University of California at Los Angeles, branch of the college of agriculture in southern California, Los Angeles medical department; at Davis, branch of the college of agriculture; at Riverside, branch of the college of agriculture in southern California, including the citrus experiment station and graduate school of tropical agriculture; at La Jolla, the Scripps Institution of Oceanography.

The total number of resident students in the academic and professional departments, fall and spring sessions, 1932-33, was 21,305, of whom 11,768 were men and 9537 were women. At Berkeley 13,088 students were enrolled; at Los Angeles, 7168. The enrollment in the university extension division in 1932-33 was 24,013 in classes and correspondence courses. The 1933 summer session enrollments (Berkeley and Los Angeles) totaled 4151. At the beginning of the autumn term there were approximately 2000 members on the regular teaching staff and 800 on the extension staffs. The total income for 1932-33 was \$14,203,000, including gifts totaling \$63,000 for permanent improvements, \$580,000 for endowments, and \$350,000 for current use. Total assets were listed at \$72,745,000, including \$48,289,000 in real estate, improvements,

and equipment and \$18,111,000 in endowment and trust funds. The libraries contained approximately 1,300,000 volumes. President, Robert Gordon Sproul, LL.D.

CALMETTE, kâl'mêt', LEON CHARLES ALBERT. A French bacteriologist and sanitarian, died in Paris, Oct. 29, 1933. Born in Nice, July 12, 1863, he attended the lycées of Clermont-Ferrand in Brest and Saint-Louis in Paris and was graduated in medicine from the University of Paris in 1886. After spending several years as surgeon in the French Navy he was appointed in 1889 the first director of the Pasteur Institute at Saigon, French Indo-China, where he became famous for his discovery of a cobra antivenin. In 1893 he was recalled to France as director of the Pasteur Institute at Lille, serving also as professor of bacteriology and hygiene at Lille University. In 1916 when Émile Roux was promoted to the directorship of the Pasteur Institute in Paris he was made assistant director.

After the World War Dr. Calmette was active in tuberculosis prevention through the immunizing of infants born to tuberculous parents by vaccination with attenuated tubercle bacilli, developing thereby a higher degree of resistance to the disease in later life. His publications included *Recherches sur l'épuration biologique des eaux d'égout* (8 vols., 1905-14); *Les venins, les animaux venimeux et la sérothérapie antivenimeuse* (1907); *Recherches expérimentales sur la tuberculose* (1907-14); *L'infection bacillaire et la tuberculose chez l'homme et les animaux* (1920); and *La vaccination préventive contre la tuberculose* (1927).

CAMBODIA, kâm-bô'dî-â. A state under the protection of France, and one of the five states constituting French Indo-China (q.v.). Executive authority is exercised by the French Resident-Superior, who acts through King Sisowathmonivong (crowned July 22, 1928). Resident-Superior in 1933, F. Lavit.

CAMERAS. See PHOTOGRAPHY.

CAMEROON, kâm-êr-ôon', or CAMEROONS. The former German protectorate of Kamerun in West Africa on the Gulf of Guinea, between Nigeria and French Equatorial Africa. Occupied by British and French troops in February, 1919, it was divided between the two nations by an agreement signed in London, July 10, 1919. In 1922 the territories were confirmed as British and French mandates by the Council of the League of Nations.

FRENCH CAMEROON. The area mandated to France amounted to 166,489 square miles, not including the 107,270 square miles ceded to Germany in 1911 and now incorporated in French Equatorial Africa. The population of French Cameroon on July 1, 1931 was estimated at 2,192,163 including 2163 Europeans. The chief towns are Yaunde, the capital; and Duala, the largest town and chief seaport. In 1930 there were 89 government schools with an attendance of 6244 and 51 private schools with 7059 students. Tobacco, almonds, palm oil, timber, rubber, cacao, and ivory are the chief products. The exports in 1931 were valued at 82,133,000 francs and imports, 104,368,000 francs (franc at par equals \$0.0392). General budget balanced at 83,263,900 francs in 1931; special railway budget, 28,500,000 francs; special medical budget, 15,917,149 francs. Vessels entered the ports of Duala and Kibra in 1931 totaled 436 and 106 respectively. There are 292 miles of railway, and

2777 miles of roadway. Commissioner in 1933, M. Marchand.

BRITISH CAMEROONS. The territory mandated to Great Britain has an area of 36,236 square miles and extends along the Nigerian border from the sea to Lake Chad. Population (1931 census), 773,840. The chief products are palm kernels, palm oil, bananas, rubber, and cacao. Imports in 1931 were valued at £107,767; exports, £155,432. Government expenditure for 1930-31 was £149,952; revenue was £81,945. During 1931 a total of 118 vessels aggregating 203,744 tons entered and cleared the port of Victoria, and 102 vessels totaling 70,329 tons entered the port of Tiko. The chief town is Buea with about 3000 inhabitants. The Governor of Nigeria administers the territory. See NIGERIA.

CAMPBELL, ADMIRAL SIR HENRY HERVEY. A British naval officer, died in London, Feb. 12, 1933. Born Feb. 27, 1865, he served as a midshipman on the *Inconstant* during the Egyptian War of 1882. Following his transfer to the gunnery division six years later, he became commander of the *Crescent* in 1898 and captain of the vessel in 1902. He was in command during 1905-06 of the *Terrible*, escort to the *Renown* on which the Prince and Princess of Wales, now the King and Queen of England, sailed to India. After serving for three years as assistant director of naval intelligence he was commissioned in 1909 captain of the *Hindustan* and in 1911 acted as first governor to the present Prince of Wales during the Prince's service as midshipman on board that vessel. The following year he was made rear admiral.

On the mobilization of the British fleet at the outbreak of the World War Sir Henry was appointed commander of a cruiser squadron to protect the Belgian coast and to maintain a general command of the southern waters of the North Sea. This squadron formed part of the supporting forces during the engagement with the German fleet at Helgoland, Aug. 28, 1914. He was rear admiral of the home fleets at The Nore until 1917 when he was assigned to the Admiralty for special service in connection with the protection of trade, being largely responsible for the arming of merchant vessels against the submarine menace and for perfecting the method of protecting seaborne commerce, especially in keeping open routes for food ships. He was advanced to admiral on the retired list in 1921. Among the honors conferred on him were Companion of the Bath (1917) and Knight Commander of the Royal Victorian Order (1930). He was also a groom-in-waiting to the King.

CAMP FIRE GIRLS OF AMERICA. An organization primarily for the adolescent girl, whose object is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." It was organized nationally in 1911 and chartered in 1912, with Dr. Luther H. Gulick as president. The purpose of its activities is not the attainment of particular skill in any of the seven crafts: Home, health, hand, camp, nature lore, business, and citizenship, but the development, and happiness through development, of the individual girl, who discovers new interests and new talents and at the same time enjoys the companionship of other girls.

Each year the organization launches a special project. "Making the Most of Me" was the theme of the 1933 project, which involved health, ap-

pearance, and behavior. Girls became interested in the relation of good health to attractiveness, learned the principles of costume design, and came to realize the part manners play in making an agreeable personality.

The membership of the organization in 1932 was 231,200, including 173,165 Camp Fire Girls and Guardians and 33,000 Blue Birds, the youngest members. There were held, during the school year of 1931-32 and the summer of 1932, 180 training courses which were attended by 4094 leaders and college students who desired to become leaders. During the summer of 1932, 13,425 Camp Fire Girls attended 100 Class A camps (camps having an attendance of 25 or more), while more than 6000 others went camping in small groups with their leaders. The organization publishes *The Guardian*, a programme resource for leaders.

At the meeting of the board of directors held in New York City Oct. 7, 1933, the following officers were elected: Mrs. Lida Foote Tarr, president; Miss Florence Hughes, first vice-president; Dr. Joseph E. Raycroft, second vice-president; Dr. Jay B. Nash, third vice-president; Dr. Myron T. Scudder, treasurer; and Lester F. Scott, secretary and national executive. National headquarters are at 41 Union Square, New York City.

CANADA. Dominion of the British Commonwealth, comprising nine Provinces and two Territories. Capital, Ottawa.

AREA AND POPULATION. The land area, the census population of June 1, 1931, and the estimated population of 1932 are shown in the accompanying table. The total water area is about 180,035 square miles.

AREA AND POPULATION OF CANADA

Province	Land area, sq. miles	Population	
		1931	1932
Prince Edward Island	2,184	88,038	88,000
Nova Scotia . . .	20,743	512,846	513,000
New Brunswick . .	27,710	408,219	409,000
Quebec	523,534	2,874,255	2,904,000
Ontario	363,282	3,431,683	3,459,000
Manitoba	219,723	700,139	705,000
Saskatchewan . . .	237,975	921,785	971,000
Alberta	248,800	731,605	740,000
British Columbia .	349,970	694,263	704,000
Yukon Territory . .	205,346	4,230	4,000
Northwest Territories	1,258,217	9,723	9,000
Total	3,510,008	10,376,786	10,506,000

The total population at the 1921 census was 8,787,949. Among the nine Provinces, the density of population is greatest in Prince Edward Island and least in British Columbia. Of the 1931 total, 5,374,541 were males and 5,002,245 females. Racial origins of the chief national groups in the population in 1931 were: English, 2,741,419; Irish, 1,230,808; Scottish, 1,346,350; total British, 5,381,071; French, 2,927,990; German, 473,544. Persons of British stock comprised 51.86 per cent of the total 1931 population; French, 28.22 per cent; other European races, 17.59 per cent. There were 5979 Eskimos, 122,911 Indians, and 19,456 Negroes. Roman Catholics in 1931 numbered 4,285,388 (including 186,654 Greek Catholics); United (Protestant) Church of Canada, 2,017,375; Anglicans, 1,635,615; Presbyterians, 870,728; Baptists, 443,341; Lutherans, 394,194. Foreign born residents of Canada in 1931 numbered 1,122,695; unnaturalized aliens, 507,724. In the same year 41.73 per cent of the population resided in places of over 5000

inhabitants, as compared with 52.3 per cent in the same category in the United States.

Populations of cities having over 50,000 inhabitants in 1931, with the 1921 figures in parentheses, were: Montreal, 818,577 (618,500); Toronto, 631,207 (521,893); Vancouver, 246,593 (163,220); Winnipeg, 218,785 (179,087); Hamilton, 155,547 (114,151); Quebec, 130,594 (95,193); Ottawa, 126,872 (107,843); Calgary, 83,761 (63,305); Edmonton, 79,197 (58,821); London, 71,148 (60,959); Windsor, 63,107 (38,591); Verdun, 60,745 (25,001); Halifax, 59,275 (58,372); Regina, 53,209 (34,432).

Exclusive of the Territories, there were in 1931, 240,108 living births, 104,449 deaths and 66,578 marriages. The birth rate per 1000 of population ranged from 14.9 for British Columbia to 29.1 for Quebec. The number of immigrants entering Canada during 1932 was 20,591, of whom 13,709 came from the United States, 3327 from Great Britain and Ireland, and 2640 from other countries.

EDUCATION. According to the 1931 census, 7.18 per cent of the population of five years of age and over could neither read nor write, as compared with 9.25 per cent in 1921. The population of school age (5-19 years) in 1931 was 3,246,391, of whom 2,542,747 were enrolled in educational institutions. Of these, 2,137,810 were enrolled in about 30,500 provincially-controlled ordinary day schools, 95,083 were in private ordinary day schools, and 77,618 were in colleges and universities. There were six Provincial universities in Canada and 17 private institutions of university grade. The expenditure on schools, colleges, and universities in 1931 was \$178,701,507. Also see article on each Province.

AGRICULTURE. Although the value of manufactured products is greater, agriculture is of primary importance to Canada. The chief agricultural industries are grain growing, dairying, fruit culture, stock raising, and fur farming. The gross agricultural wealth in 1932 was officially estimated at \$5,069,930,000 (\$5,696,972,000 in 1931). Farm lands were valued at \$1,948,070,000; buildings at \$1,342,924,000; implements and machinery at \$650,664,000; livestock at \$375,722,000; poultry at \$34,138,000; animals on fur farms at \$6,514,000; and agricultural production at \$711,898,000. There were 728,444 occupied farms in 1931; about 369,000,000 acres were estimated to be suitable for farming.

Due to falling prices and reduced crops, the value of Canadian agricultural production showed a steady decline from the peak of \$1,806,020,000 in 1928 to \$880,241,000 in 1931 and \$711,898,000 in 1932. Field crops from 59,633,500 acres in 1932 were valued at \$416,586,900, as against crops valued at \$432,199,400 from 58,074,905 acres in 1931. The remainder of the 1932 agricultural revenue was derived from: Dairy products, \$131,623,000; farm animals, \$69,033,000; poultry and eggs, \$48,824,000; fruits and vegetables, \$30,245,000; tobacco, \$6,088,000; maple products, \$2,747,000; fur farming, \$2,732,000; honey, \$1,651,000; wool, \$1,093,000; clover and grass seed, \$962,000; and flax fibre, \$170,000. Livestock in 1932 included about 3,088,630 horses, 3,624,600 milch cows, 4,886,500 other cattle, 3,644,500 sheep, and 4,639,100 swine. Yields of the leading field crops in 1930, 1931, and 1932, with preliminary returns for 1933, are shown in the accompanying table.

CANADIAN CROP YIELDS, 1930-33
[Units in thousands of bushels, except as indicated]

	1930	1931	1932	1933*
Wheat	420,672	304,144	428,514	271,821
Oats	423,148	328,278	391,561	311,812
Barley	135,160	67,362	80,773	63,787
Rye	22,018	5,322	8,938	4,725
Buckwheat ..	10,903	6,649	8,424	8,664
Mixed grains ..	44,276	39,431	39,036	33,204
Potatoes	48,241 ^b	52,305 ^b	39,416 ^b
Hay and clover	16,397 ^c	13,960 ^c	13,559 ^c

* Estimates. ^b 1,000 cwt. ^c 1,000 tons.

The value of field crops in 1933 was estimated at \$427,791,000, compared with \$444,894,900 in 1932 and \$432,199,400 in 1931.

Wool production in 1932 was 20,518,000 lbs. (20,365,000 lbs. in 1931); farm eggs, 277,604,215 valued at \$36,586,415 (286,882,447 worth \$49,206,845 in 1931); creamery butter, 225,955,246 lbs. in 1931 valued at \$50,198,878; factory cheese, 113,956,639 lbs. in 1931 valued at \$12,824,095. Fruit production in 1932 included 2,789,447 barrels of apples; grapes, 49,000,000 lbs.; strawberries, 23,909,752 qts.

MANUFACTURING. One of the leading world producers of automobiles, hydro-electric power, paper, aluminum, and rubber goods, Canada in 1931 had 24,501 industrial establishments, employing 557,426 workers. Salaries and wages totaled \$624,545,561; the net value of products, \$1,474,581,851; the gross value of products, \$2,698,461,862. This compared with 1930 statistics showing 24,020 plants, 644,439 employees, salaries and wages of \$736,092,766, a net production value of \$1,761,986,726, and a gross production value of \$3,428,970,628. The gross value of manufactured products in 1931 was divided by industrial groups as follows: Vegetable products, \$535,079,463; wood and paper, \$484,237,930; iron and its products, \$374,725,068; animal products, \$320,803,456; textiles products, \$317,158,670; non-ferrous metals, \$211,862,412; non-metallic minerals, \$181,431,906; central electric stations, \$122,310,730; chemicals and allied products, \$105,501,905; miscellaneous industries, \$45,350,322. Ontario and Quebec, with gross manufacturing productions of \$1,312,400,828 and \$849,154,353, respectively, far exceed the other provinces in manufacturing activity.

During the world depression the Canadian output of pig iron, steel, and iron and steel products showed a drastic decline. The pig iron production fell from 1,209,779 short tons in 1929 to 470,443 tons in 1931 and 161,426 in 1932; steel ingots and castings, from 1,543,387 tons in 1929 to 383,923 in 1932. There were (1933) 21 automobile factories in operation, with an annual capacity of about 400,000 vehicles; actual output in 1932, 60,816 units. Food, clothing, and certain other industries maintained a higher relative level of production during the depression. The hydraulic turbine power installed in Canada up to Dec. 31, 1932, aggregated 7,045,260 horse power (6,666,337 horse power on Dec. 31, 1931). The index of employment in all industries, based on 1926 as 100, declined from 78.5 in January, 1933, to 76.0 in April and then rose to 91.8 in December. The weighted index of the physical volume of industrial production (1926 = 100) increased from a monthly average of 60.9 in February, 1933, to 82.6 in July and 86.2 in December.

MINERAL PRODUCTION. In 1931, Canada stood first among the nations in the production of asbestos and nickel, second in gold, zinc, and

cobalt, third in silver and copper, fourth in lead, and eleventh in coal. In that year Canada produced 83 per cent of the world's nickel output, 57 per cent of the asbestos, 33.4 per cent of the cobalt, 15.5 per cent of the zinc, 12.6 per cent of the gold, 10.6 per cent of the silver, 9.6 per cent of the copper, and 8.9 per cent of the lead. As a result of the decline of mineral prices, the value of Canadian mineral production declined from \$310,850,246 in 1929 to \$228,029,018 in 1931 and \$182,320,150 in 1932. The three leading mineral producing provinces in 1932 were Ontario, \$79,239,578; British Columbia, \$26,855,997; and Quebec, \$24,369,246. The values of the leading minerals produced in 1932 (provisional figures) and 1931 are as follows: Gold, \$63,061,103 (\$55,687,688 in 1931); silver, \$5,803,769 (\$6,141,943); copper, \$15,294,022 (\$24,114,065); lead, \$5,409,758 (\$7,260,183); nickel, \$7,179,862 (\$15,267,453); zinc, \$4,144,454 (\$6,059,249); coal, 11,823,411 short tons valued at \$37,045,272 in 1932 (12,243,211 tons valued at \$41,207,682 in 1931); natural gas, \$8,682,505 (\$9,026,764); crude petroleum, \$3,000,886 (\$4,211,674); asbestos, \$3,039,721 (\$4,812,886).

Canada's mineral production in 1933 was estimated at \$198,253,000, against \$182,682,000 in 1932, an increase of 8.5 per cent. Marked gains were recorded in base metals, especially nickel, copper, lead and zinc, while silver and gold (gold valued at \$20.67 per ounce) showed a slight decline. The value of all metals was \$124,382,000, a gain of 20 per cent; that of non-metallic minerals, was \$8,898,000, a 28 per cent increase. The quantity and value of the chief mineral products was: Gold, 2,945,070 fine ounces, \$60,880,000; silver, 15,360,764 fine ounces, \$5,774,000; nickel, 84,586,000 pounds, \$20,736,000; lead, 269,000,000 pounds, \$6,456,000.

FORESTS. The value of Canadian forestry production in 1930 was \$303,145,169, including the value of the products of woods operations and the value added by manufacturing in sawmills and pulp-mills, but not in paper-mills. This was 20 per cent of the total primary production for the Dominion, and gave forestry second place in the value of primary output. The total cut of lumber and other forest products in Canada in 1931 was estimated at 2,306,143,706 cubic feet of standing timber, valued at \$141,123,930. The value of sawmill products was \$62,927,750, of which lumber comprised \$46,136,340. The value of wood and paper manufactures in 1931 was \$484,237,930, or nearly 18 per cent of the total manufactured production. Products of forest origin accounted for 30.4 per cent of the total value of exports in the year ended Mar. 31, 1932. A total of 5,046,291 cords of pulpwood, valued at \$51,973,243, was produced in 1931. The output of wood pulp was 3,167,960 tons, valued at \$84,780,809 (3,619,345 tons valued at \$112,355,872 in 1930). There were 71 pulp and paper factories in 1931, which produced 2,611,225 tons of paper and pulp productions, valued at \$143,957,264 (2,926,787 tons valued at \$173,626,383 in 1930). The newspaper paper output was 2,227,052 tons, valued at \$111,419,637, in 1931 and 1,907,666 tons (preliminary) in 1932.

FISHERIES. The value of Canadian fisheries declined from an annual average of about \$50,000,000 during 1927-29 to \$30,517,306 in 1931 and \$25,962,088 (preliminary) in 1932. British Columbia and Nova Scotia are the two leading fishery provinces, together accounting for over

63 per cent of the total output in 1932; their respective totals were \$9,914,071 and \$6,557,943. Normally about 60 per cent of the total catch is exported. The chief food fish, in order of the value of the 1931 catch, are salmon, lobsters, cod, herring, halibut, whitefish, and haddock.

FURS. The production of raw furs in the year ended June 30, 1932, was valued at \$10,156,225, compared with \$11,681,221 in the preceding year. Silver fox furs accounted for \$3,089,179; muskrat, \$1,391,010; and white fox, \$1,373,809.

FOREIGN INVESTMENTS. British and foreign investments in Canada as of Jan. 1, 1931, were estimated by the Dominion statistician at \$6,477,879,000, of which \$4,107,803,000 was from the United States, \$2,204,857,000 from Great Britain, and \$165,217,000 from other countries. Canadian investments in other countries were estimated at \$1,831,310,000, of which \$1,047,285,000 was placed in the United States, \$84,826,000 in Great Britain and \$699,198,000 in other countries.

FOREIGN TRADE. The sharp decline in Canadian foreign trade during the period of the world depression is shown in the accompanying table compiled from the *Canada Year Book* for 1933.

CANADIAN FOREIGN TRADE, 1929-30 TO 1932-33

Year ended March 31	Total exports	Imports for home consumption
1929-30	\$1,144,938,070	\$1,248,273,582
1930-31	817,028,048	906,612,695
1931-32	587,565,517	578,503,904
1932-33 *	480,713,797	406,271,329

* Preliminary figures.

The distribution of exports and imports, by industrial groups, in the fiscal year 1932-33 is shown in the accompanying table.

CANADIAN EXPORTS AND IMPORTS, BY INDUSTRIAL GROUPS, IN 1932-33

	Exports	Imports
Agricultural and vegetable products	\$203,370,418	\$88,220,858
Animals and animal products	54,333,047	15,438,577
Fibres, textiles and textile products	4,731,094	61,213,824
Wood, wood products and paper	120,886,796	20,489,242
Iron and its products	17,277,099	59,336,765
Non-ferrous metals and their products	42,642,318	17,684,958
Non-metallic minerals and products	9,215,837	87,658,005
Chemicals and allied products	11,099,814	25,455,432
Miscellaneous commodities	10,243,532	30,772,668

The United Kingdom replaced the United States as the principal market for exports of Canadian produce in 1932-33, purchasing goods valued at \$184,361,019 (\$174,043,725 in 1931-32) as compared with American purchases totaling \$143,160,400 (\$235,186,674 in 1931-32). The British Empire took Canadian exports valued at \$222,118,927 in 1932-33, as compared with \$217,956,387 in 1931-32. The Netherlands, France, and Japan, followed in the order named as markets for Canadian goods. The chief sources of imports in 1932-33 were the United States, \$232,548,055 (\$351,686,775 in 1931-32); the British Empire, \$120,271,909 (\$147,811,993 in 1931-32); Great Britain, \$86,353,681 (\$106,371,779 in 1931-32); Germany, \$9,088,905 (\$11,657,869); France, \$7,712,558 (\$13,570,141).

During the calendar year 1933 imports totaled

\$401,300,000 (\$452,600,000 in 1932) and exports \$537,500,000 (\$501,800,000 in 1932). Figures in Canadian dollars.

INTERNATIONAL PAYMENTS. The balance of Canadian international payments in 1932 showed credits exceeding debits of about \$72,000,000. Of this \$23,000,000 represented net capital exports and the remainder was attributed to errors and omissions. During the year Canada exported \$248,000,000 to meet interest payments due abroad and received but \$56,000,000 on Canadian investment abroad. Outstanding factors in offsetting the adverse balance thus created were tourist expenditures of \$212,448,000 (Canadian currency) in Canada, gold exports of \$67,000,000, and a surplus of exports over imports totaling \$50,187,000. The visible and invisible imports and exports balanced at \$928,927,000.

FINANCE. The steady decline in Dominion revenues, accompanied by a steady increase in annual expenditures, during the course of the world economic depression is shown in the accompanying table compiled with the aid of the Dominion Bureau of Statistics.

DOMINION RECEIPTS AND EXPENDITURES,
1929-33

<i>Fiscal year, ended Mar. 31</i>	<i>Total receipts</i>	<i>Total expenditures</i>	<i>Surplus (+) or deficit (-)</i>
1929 . . .	\$460,151,481	\$388,805,953	\$ + 71,345,528
1930 . . .	445,916,992	398,176,246	+ 47,740,746
1931 . . .	856,160,876	440,008,855	- 83,847,979
1932 . . .	836,721,305	450,955,541	- 114,234,236
1933 . . .	820,065,501	540,700,155	- 220,634,654

Ordinary expenditures during this five-year period showed no great variation; they rose from \$350,952,924 in 1928-29 to \$389,558,289 in 1930-31 and then declined to \$367,487,472 in 1932-33. Special expenditures increased abruptly from \$1,397,754 in 1928-29 to the successive totals of \$9,803,722 (1929-30), \$16,740,848 (1930-31), \$55,460,134 (1931-32), and \$96,704,225 (1932-33). The latter total includes \$30,700,905 spent under the Unemployment and Farm Relief Act of 1931. Capital expenditures during this period reached a peak of \$28,222,318 in 1930-31 and fell to \$8,548,155 in 1932-33. Debt charges were \$144,829,031 in 1932-33 (\$125,643,615 in 1931-32). Tax receipts decreased annually, despite several increases in rates, from the peak of \$395,921,028 in 1928-29 to \$275,085,033 in 1931-32 and \$254,318,801 in 1932-33.

The estimates for 1933-34, as submitted to Parliament, called for expenditures of \$358,656,488, as compared with 1932-33 estimates of \$364,884,224. To balance these expenditures, the Minister of Finance levied new taxes designed to produce an additional \$70,000,000 of revenue (see under *History*). The chief items of expenditure listed in the budget were: Charges on public debt, \$142,278,443; pensions, \$47,092,321; Post Office, \$30,619,375; subsidies to Provinces, \$13,686,177; public works, \$11,991,482; national defense, \$11,307,559; pensions and national health, \$11,257,500; national revenue, \$10,436,786; and civil government, \$10,101,538.

The net public debt of the Dominion on Mar. 31, 1933, totaled \$2,599,089,000, with annual interest charges of \$121,637,300, as compared with a net debt on Mar. 31, 1932, of \$2,375,846,172, with interest charges of \$121,151,106. The total public debt of the Dominion, the nine Provinces, the municipalities and corporations amounted on

Mar. 31, 1933, to \$8,855,596,800 on which the annual interest charges was \$421,965,800 or an average rate of 4.77 per cent. The gross liabilities of the Provinces totaled \$1,363,382,464, while Provincial indirect liabilities added a further \$215,977,011. The grand total of direct liabilities of Canadian municipalities was \$1,584,000,000. As of Mar. 31, 1933, bonds guaranteed by the Dominion of Canada for both principal and interest aggregated \$780,148,354 while those guaranteed for interest only totaled \$216,000,000.

SHIPPING. For the fiscal year ended Mar. 31, 1932, 157,980 vessels of 72,200,372 registered tons entered Canadian ports and 156,045 vessels of 71,172,889 tons departed. Sea-going vessels accounted for 19,462 arrivals, aggregating 17,095,883 tons, and for 19,593 departures, totaling 17,182,454 tons. Coastwise vessels accounted for 82,560 arrivals, aggregating 36,240,041 tons, and for 80,033 departures totaling 34,730,037 tons. The international trade on the Great Lakes accounted for the remainder. The Canadian merchant marine on Dec. 31, 1932, consisted of 8895 vessels aggregating 1,475,128 net registered tons. The total freight movement through Canadian canals in 1933 was 18,788,527 tons (Welland Ship Canal, 9,194,396; St. Lawrence Canals, 6,951,064; Sault Ste. Marie, 2,277,729).

RAILWAYS, ETC. Canada's steam railway mileage of 41,967 as of Jan. 1, 1932, was exceeded only by that of the United States (253,286 miles). The Canadian railways owned an additional 341 miles of line in the United States. Including second track, yards, sidings, and industrial track, the total Canadian mileage was 56,908. During the calendar year 1931, the steam railways carried 26,396,812 passengers and 85,993,206 tons of freight, the gross earnings being \$358,549,382 and the operating expenses \$321,025,588. In 1932 the railways carried 21,099,582 passengers and 67,722,105 tons of freight, with gross earnings of \$290,932,246 and operating expenses of \$255,286,887. The net income deficit of the Canadian National Railways for 1932 was \$61,006,919, exclusive of interest on government loans. The gross operating revenue was \$161,103,595 (\$200,505,162 in 1931), operating expenditures were \$155,208,241 (\$199,313,075 in 1931), interest on funded debt was \$56,965,278. The gross operating income of the Canadian Pacific Railway in 1932 was \$123,936,713, against \$147,846,118 in 1931, and net earnings in the same period declined to \$20,098,984 from \$25,424,766 in 1931.

Traffic through Canadian canals in 1932 totaled 17,956,000 tons, a 10 per cent increase over the preceding year, attributable to better shipping conditions on the improved Welland Canal. The canals, extending 509 miles, opened up 1846 miles of waterways to navigation. Civil air lines during 1932 carried 76,800 passengers, 3,129,974 lbs. of freight or express, and 413,687 lbs. of mail. The total mileage flown was 4,569,131. Air mail transportation between London, Ont., and Buffalo, N. Y., was inaugurated Feb. 11, 1933. At the end of 1932 there were 398,320 miles of highways, of which 91,312 miles were surfaced and 307,008 miles were of gravel, improved earth, or unimproved.

GOVERNMENT. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament of two Houses: a Senate and a House of Commons,

the former consisting of 96 members appointed for life and the latter of 245 members, in accordance with the distribution act of 1924, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. The nine Provinces have local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive.

Governor-General in 1933, the Earl of Bessborough, who assumed office Apr. 4, 1931. The composition of Parliament following the election of July 28, 1930, was: Conservatives, 138; Liberals, 87; United Farmers of Alberta, 10; Progressives, 2; Liberal-Progressives, 3; Labor, 3; Independents, 2. The Conservative Ministry in office in 1933, in order of precedence, was as follows: Prime Minister, President of the Privy Council, Secretary of State for External Affairs, Richard B. Bennett; Minister of Finance, E. N. Rhodes; Ministers without Portfolio, Sir George H. Perley and Arthur Meighen; Labor, W. A. Gordon; Justice and Attorney-General, Hugh Guthrie; Fisheries and Marine, Alfred Duranleau; Trade and Commerce, H. H. Stevens; Railways and Canals, Dr. R. J. Manion; National Revenue, E. B. Ryckman; Minister without Portfolio, J. A. Macdonald; Postmaster-General, Arthur Sauvé; Pensions and National Health, Murray MacLaren; Public Works, H. A. Stewart; Secretary of State, C. H. Cahan; National Defense, Lieut.-Col. D. M. Sutherland; Agriculture, Major Robert Weir.

HISTORY

THE ECONOMIC REVIVAL. The opening of the year 1933 found Canada still struggling unsuccessfully to check the four-year decline in economic activity. Wheat prices were about 15 cents a bushel lower than in January, 1932. The Canadian dollar continued to depreciate with reference to the American dollar, despite the continued trade surplus and heavy exports of gold. Foreign trade had declined 25 per cent from the level maintained a year earlier. Business and industry continued to decline and by the end of February about 1,360,000 out of some 10,000,000 Canadians were receiving direct relief. In March, however, there was an upswing in general economic activity which gained momentum with the beginning of the business revival in the United States in April. The price of No. 1 Northern wheat rose from the low point of \$0.423 per bushel in December, 1932 to \$0.833 in July, 1933. Foreign trade, industrial production, business activity, and employment indexes all showed a decisive improvement. As in the United States, there were fluctuations in the prices of commodities and stocks. But the general trend was upward throughout the remainder of the year. Mining and manufacturing production, lumbering, foreign trade, employment, and governmental revenues all showed a steady increase, with none of the sharp fluctuations recorded in the United States.

TARIFF POLICIES. The efforts of the Bennett government throughout the year 1933 were concentrated mainly upon efforts to readjust the Canadian economic system to the exigencies of the depression. Prospects of the termination of the tariff war between Canada and the United States were opened early in the year. President-

elect Roosevelt sounded out Canadian officials with reference to a reciprocal trade treaty, meeting with a favorable response from Prime Minister Bennett. The latter stated in the Dominion Parliament February 20 that his government conditionally approved such a treaty. Negotiations were opened by Prime Minister Bennett and President Roosevelt in Washington late in April, when Mr. Bennett was guest of the President at the White House. In return for the admission of Canadian copper, oil, lumber, live stock, potatoes, dairy products, fish and coal to the American market, the Canadian government offered to reduce its tariffs on American manufactured and semi-manufactured goods. The negotiations were indefinitely postponed, however, when President Roosevelt discovered unforeseen conflicts between his policy of tariff reduction and his programme for internal economic recovery.

Meanwhile the 57 amendments to the tariff schedule proposed in the Budget Speech of the Minister of Finance March 21 were favorable to the United States in general. They became provisionally effective March 22 and were ratified, with some changes, by Parliament during the week ending April 29.

Some dissatisfaction with the working out of the Ottawa tariff agreements of 1932 was expressed during the year. Particular objection was raised to the failure of the British government to take action against low-priced Soviet lumber imports, which drove Canadian lumber out of the British market. It was charged that the Russian lumber was imported into Britain in violation of the anti-dumping clauses of the Ottawa Agreements. About 80 per cent of Soviet imports into Britain were embargoed by the British government on April 19, in retaliation for the trial of British engineers in Moscow. Canadian protests were renewed, however, when the British anti-Soviet embargo was lifted July 1.

Early in the year the British made other tariff concessions to Canada. They abandoned the embargo on Canadian live cattle. The amount of empire content necessary to obtain imperial preference was raised from 25 to 50 per cent. Great Britain also granted the imperial preference of 6 cents a bushel on Canadian wheat shipped through the United States. The British were not disposed to go further in Canada's behalf. Trade returns for the fiscal year ended Mar. 31, 1933, showed that Canada had increased its exports to Great Britain by more than \$10,000,000, as compared with the previous year, while imports into Canada from Great Britain had decreased by \$20,000,000.

An important trade agreement with France, signed at Ottawa May 12 and subsequently ratified by both countries, went into effect June 10, 1933, to run one year. It replaced and amplified the commercial convention abrogated in June, 1932, and contained reciprocal tariff preferences on 1148 items. France accorded to Canada its minimum tariff rates on 185 items and percentage discounts from its general tariff rates on 24 items. Canada granted its intermediate tariff rates to France on 840 items, British preferential rates on 7 items and reductions varying from 10 to 25 per cent below the intermediate rates on 91 items. Under existing most-favored-nation treaties, Canada was obliged to extend the same preferences to imports from Argentina, Belgium, Colombia, Czechoslovakia, Italy, Japan, the

Netherlands, Norway, Spain, Sweden, Switzerland, Venezuela, and various other countries. A second treaty between France and Canada, signed at the same time, provided most-favored-nation treatment for their respective nationals in matters of taxation, purchase and sale of property, conduct of business, status in courts, etc.

The trade agreement between Canada and South Africa, signed at Ottawa, Aug. 20, 1932, went into effect June 30, 1933. On the same date, Canada extended the benefit of its British preferential tariff to the Unfederated Malay States. A six-months' extension of the Canada-New Zealand trade agreement, to May 24, 1934, was announced in November.

THE WHEAT AGREEMENT. As one of the leading wheat-exporting countries, Canada joined with the United States, Australia, Argentina, the Soviet Union, and the Danubian states in agreeing at London August 25 to limit wheat exports for two years. In an effort to eliminate the surplus world wheat stocks of 960,000,000 bushels, they agreed to export a joint maximum of 560,000,000 bushels in 1933-34 and, with the exception of the Soviet Union and the Danubian states, to reduce either their acreage or their exports by 15 per cent in 1934-35.

THE 1933-34 BUDGET. Besides the tariff changes introduced by the Minister of Finance in his budget announced March 21, increases in taxation designed to bring in an additional \$70,000,000 of revenue were provided for. The 6 per cent sales tax was extended to numerous commodities previously exempt. New excise taxes were imposed upon cosmetics and toilet preparations, automobile tires and tubes, cigarette papers and tubes, refined sugar, unfermented wort, and malt sirup, powder, and extracts. The individual and corporation income taxes were increased, interest or dividends paid by Canadians to non-residents were taxed 5 per cent at the source, and rents and royalties payable by Canadians to non-residents were taxed 12½ per cent at the source.

Another interesting feature of the budget was the introduction of a stabilization fund to enable Canadian exporters of farm products to the British market to obtain payment at the rate of \$4.60 (Canadian) per pound sterling. The plan applied to exports of animals, meats, poultry, fresh and canned fish, tobacco, cheese, milk products, canned fruits and vegetables, maple products, eggs, and honey. The annual cost of the subsidy was estimated at from \$6,000,000 to \$10,000,000.

THE CURRENCY PROBLEM. Owing to restrictions upon gold exports, Canada had been actually off the gold standard since 1929. The country was taken officially off gold on Apr. 24, 1933, when the Finance Minister announced that the government had suspended the redemption of Dominion notes in gold. In the meantime, the depreciation of the Canadian dollar with relation to the American dollar had increased the burden of Canadian interest and amortization payments due in New York. It also erected a new barrier against Canadian imports from the United States. During 1932 the exchange value of the Canadian dollar ranged from 83.68 to 88.62 cents. It declined from 88.62 cents on Jan. 3, 1933, to around 82.81 cents for the first week of April. Then the action of the United States government in abandoning the gold standard and the subsequent

depreciation of the U. S. dollar caused the gradual recovery of the Canadian dollar.

Despite the premium on the U. S. dollar, all Dominion and provincial obligations maturing in New York were promptly met. The Dominion government was forced to aid the four western provinces in meeting their obligations. It declined to aid the western cities directly, with the result that the city of Calgary defaulted on a stipulated gold payment of \$2,300,000 due Jan. 3, 1933, rather than pay \$300,000 extra to purchase U. S. dollar exchange. So long as U. S. dollars remained at a premium over Canadian dollars, Canada found it profitable to sell gold in London and use the sterling proceeds to purchase depreciated American dollars for paying Canadian obligations in New York. For the same reason Canadian loans were floated in London instead of New York. For the first time in 20 years, Canada borrowed on the London market July 30, obtaining £15,000,000, maturing in 1953-58, at 4 per cent.

A \$225,000,000 internal loan, part bearing 3½ and part 4 per cent interest, was offered by the Dominion Government October 10 and fully subscribed within four days. A large part of the proceeds were used for the conversion of Victory 5½ per cent bonds maturing in November.

BANKING REFORM. In anticipation of the decennial revision of the Bank Act, the government early in August, 1933, appointed a commission to investigate and report on its operation. Lord Macmillan, chairman, and Sir Charles Addis, former director of the Bank of England, were the English members. The Canadian members were Sir Thomas White, former Dominion Finance Minister; Beaudry Leman, general manager of the *Banque Canadienne Nationale*; and Premier Brownlee of Alberta. The committee's report, published November 12, recommended immediate establishment of a central bank and of an organization for the extension of intermediate and short-term credits to farmers. Premier Bennett announced December 3 that legislation creating a central bank would be passed at the next session of Parliament.

OTHER LEGISLATION. During the spring session, Parliament adopted legislation embodying recommendations of the Royal Transportation Commission for aiding the railways to meet the drastic decline in earnings. The legislation called for the appointment of three trustees to replace the board of directors of the Canadian National system, supervision of its expenditure by the Minister of Finance, and the regular audit of its accounts by Parliament. It also provided for economies through the coöperation of the Canadian National and Canadian Pacific systems and for an arbitral tribunal to settle disputes between the two companies. Amendments to the Shipping Act passed by Parliament completely excluded foreign ships from the Canadian coastal trade and from the carrying trade between Canadian ports on the Great Lakes.

DOMESTIC POLITICS. A socialistic movement, known as the Coöperative Commonwealth Federation, gained considerable momentum during the year. Formed in Alberta in 1932, the Federation merged in 1933 with the United Farmers of Ontario, an organization which controlled Ontario after the World War. Fearing that the new party might secure the balance of power in the next Canadian parliament, the Conservatives sought to make capital of the Federation's radical pro-

gramme by inviting the more conservative Liberals into their ranks. To check inroads upon his party membership by the other parties, the Liberal leader, Mackenzie King, made numerous speeches in the Canadian West during July. The Federation candidates, however, made a poor showing in the Nova Scotia election of August 22. The Liberals overwhelmingly defeated the Conservative government of the province.

Subsequent elections confirmed the drift of voters from the Conservative to the Liberal ranks and showed the growing strength of the Commonwealth Federation. Liberals defeated the Conservatives in three federal by-elections in New Brunswick, Quebec, and Saskatchewan on October 23. In the British Columbia provincial elections early in December the Conservatives suffered another severe defeat. The Liberals captured 34 out of the 48 seats in the Legislature, while the Commonwealth Federation elected seven members. The elections reflected the strong demand in the western provinces for a greater share in Dominion relief expenditures and programmes. At a meeting in Victoria in December, the Premiers of the western provinces adopted demands for conversions of their obligations to lower interest rates, new low-interest-bearing Dominion loans, a great Dominion public-works programme, and the relief of unmarried transient labor by the Dominion Government. Premier Bennett accepted the recommendation for a public-works scheme, and called a meeting of the provincial and Dominion officials at Ottawa for Jan. 11, 1934, to discuss unemployment relief and insurance.

Other issues debated in Parliament during the year were the operation of the national broadcasting system, the redistribution of electoral constituencies in accordance with 1931 census returns, and the advisability of the granting of honorary titles to Canadians by the King.

EMPIRE RELATIONS. The economic coöperation within the British Commonwealth of Nations envisaged in the Ottawa Agreements of 1932 was furthered during 1933. Representatives of Britain and the Dominions at the World Economic Conference in London on July 27 issued a joint declaration of financial and economic policy (see *GREAT BRITAIN under History*). The first British Commonwealth Relations conference was held in Toronto, Sept. 10-21, 1933. Existing systems of communication, consultation and action between members of the Commonwealth were discussed with a view to their improvement.

The incorporation of Newfoundland in the Canadian Dominion was considered with British and Newfoundland representatives during the year. The Canadian government, however, was reluctant to take the bankrupt island under its wing in view of its own heavy obligations. See *NEWFOUNDLAND*; *GREAT BRITAIN under History*; *ECONOMIC CONFERENCE, WORLD*.

Consult Duncan McArthur, "Canada's Divided Loyalty," *Current History*, November, 1933; Wilfrid Eggleston, "Canada's Party of the Left," *Current History*, January, 1934.

CANADA, THE UNITED CHURCH OF. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Foreign mission work is carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa). In 1932

there were in Canada, Newfoundland, and Bermuda 7327 preaching places (including home missions) in 2935 pastoral charges, 678,445 communicant members, and 1,636,465 persons under pastoral care. At the fifth general council held in Hamilton, Ont., in September, 1932, the Rev. T. Albert Moore, D.D., was chosen moderator for the ensuing biennium. Headquarters are at 421 Wesley Building, Toronto, Ont. See *FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA*.

CANALS. Very little of interest can be added for 1933 to the inland waterway situation as outlined in previous *YEAR BOOKS*. In the United States the Inland Waterways Corporation continues to show small operating profits while its critics point out that all costs of operation are not reflected in the accounting and that the corporation exists only because of Federal subsidies.

Indeed, as we have noted previously, this is part of the American transportation problem which is no longer simply a railroad problem but also involves inland waterways, airways, motor traffic, and pipelines. The solution of this great problem is complicated by the fact that our railroad system has been privately built under a competitive system and is heavily taxed, whereas our waterways and highways are built and maintained at public expense, traffic on them paying but a fraction of actual costs.

Obviously the ideal plan is a coördinated system utilizing all these methods of transportation in such a way as to give the required service at the least cost. Clearly such an objective cannot be quickly or easily attained. In particular, vast adjustments in the railroad field, the abandonment of many miles of heavily bonded track, and the consolidation of other lines, is essential. The railroads themselves, faced with the usual difficulties of depression and the largely unregulated competition of these other and subsidized forms of transportation, are unable to undertake extensive abandonments and reorganization. We venture to predict that, in the end, the Federal government will have to assist in retiring many railroad bonds in order to make abandonments and adjustments possible, and will also have to adopt a fair and just policy of taxation and regulation. The situation at present is practically at a stalemate and the future of American inland waterway transportation is, accordingly, uncertain and unknown.

ST. LAWRENCE WATERWAY. The favorable report on February 10th by the Senate Foreign Relations Committee on the United States-Canadian Treaty which involves the St. Lawrence Waterway, together with the unreasoning and unreasonable demand on the part of many public organizations for increased expenditures for public works, makes it possible that this great experiment may actually be put under construction within a year or two. The project involves not only a navigable channel but also huge water power possibilities. Opinion differs widely on its advantages, some enthusiasts claiming that Great Lakes navigation would be immeasurably benefited by the construction and power rates reduced, while others point out that Canada, rather than the United States, would profit by the development of such facilities and that the power developments, for which there is no Canadian demand, would flood the New York market.

GREAT LAKES-TO-GULF WATERWAY. The completion of this waterway from Chicago to New

Orleans was marked by the first shipments in May. The Chicago authorities have since been anxious to have the Federal government take over the Sag Channel of the existing Drainage Canal to provide a by-pass for the traffic around the city to Lake Michigan. It is pointed out that such a by-pass would make it possible to turn many of Chicago's lift bridges into fixed structures. This matter is under consideration by the War Department Engineers.

PROJECTED WORKS. Among these should be noted the proposed \$138,000,000 lock canal across Florida and part of Georgia to connect the Atlantic with the Gulf of Mexico. A 35-foot channel with a summit level of a little over 100 feet, reached by four locks, is proposed. The length would be 166 miles. The R.F.C. or P.W.A. is looked to for funds but to date very little interest in the plan has been shown by the Federal authorities.

Another project of considerable interest has received local approval in the Northwest. This consists in a canal to join the Columbia River with Puget Sound. Apparently canalization works, or means of by-passing river rapids in this area and making the upper river reaches available for traffic, offer worth-while possibilities. Reports indicate that existing facilities have been fully taken advantage of and new developments are to be expected.

EBERSWALDE CANAL LIFT. A barge lift of unusual size has been built on the Berlin-Stettin Canal near Eberswalde where this cross-Germany canal comes down to the Oder River. This structure, with a lift of 118 feet, replaces four locks. Its construction was undertaken in connection with the reconstruction programme initiated to provide canal facilities for 1000-ton barges directly across Germany from the Rhine on the west to Stettin and Danzig on the Baltic. (For brief description of system see *Engineering News-Record*, June 23, 1932, p. 893.)

BIBLIOGRAPHY. During the year an interesting new study of the Suez Canal has appeared *The Suez Canal, its Past, Present, and Future*, by Sir Arnold T. Wilson (Oxford Press), which emphasizes the British viewpoint and interests in this great work. Students of the St. Lawrence project should compare the favorable point of view expressed in the recent *Great Lakes-St. Lawrence Deep Waterway to the Sea* by Tom Ireland (New York) with the analysis of *The St. Lawrence Navigation and Power Project* by Moulton, Morgan, and Lee (Brookings Inst., 1929) and that of *An Economic Survey of Inland Waterway Transportation in the United States* (Bureau of Railway Economics, 1930).

CANARY ISLANDS. An archipelago off the northwest coast of Africa, belonging to Spain. Total area 2807 square miles; population (1931), 564,873. In 1927 the islands were divided into two provinces and administered as a part of Spain. Las Palmas, with an estimated population of 79,444 (Jan. 1, 1932), and Santa Cruz de Tenerife, population 63,052, are the chief towns. Fruits and vegetables are grown for export. There is regular steamship, cable, and wireless communication with Spain. See SPAIN.

CANCER. See CHEMISTRY.

CANNON, FRANK JENNÉ. An American journalist and legislator, died in Denver, Colo., July 25, 1933. He was born in Salt Lake City, Utah, Jan. 25, 1859, a son of George Quayle Cannon, first counselor of the Church of Jesus Christ of Latter-day Saints. On his graduation from the

University of Utah in 1878 he became engaged in journalism, being associated with his father on the *Deseret News* and later serving as city editor of the *Ogden Junction*, news editor of the *San Francisco Chronicle*, and proprietor of the *Ogden Daily Standard*. In 1894 he was elected on the Republican ticket delegate to Congress from the Territory of Utah and two years later, upon the State's admission to the Union, was elected to the United States Senate, serving until 1899. During this period he became a free silver advocate, which resulted in his joining the Democratic party in 1900, serving as State chairman during 1902-04.

On removing to Denver, Colo., Mr. Cannon became editor of the *Rocky Mountain News*. He also controlled mining enterprises at Aspen, Colo., and with the revival of interest in bimetalism was president of the National Bimetallic Association and chairman of the International Silver Commission. His books *Under the Prophet in Utah* (with Harvey O'Higgins, 1911) and *Brigham Young and the Mormon Empire* (with George L. Knapp, 1913), written after his abjuration of Mormonism, were exposés of Utah's condition under the Mormon domination.

CANTILEVERS. See BRIDGES.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. The province occupying the most southerly part of Africa, formerly known as Cape Colony; one of the original provinces of the Union of South Africa. Area, 276,536 square miles excluding the Walvis Bay area of 430 miles. The estimated mean population on June 30, 1932 was 3,163,700 of whom 758,000 were Europeans. Europeans numbered 749,231 (1931 census) including the population of Walvis Bay. The chief towns, with their white populations for 1931, were: Cape Town, the capital, 150,914; Port Elizabeth, 43,924; East London, 27,801; Kimberley, 18,618. Births, in 1930, were 19,468 European and 40,609 non-European; deaths, 7416 European and 26,412 non-European, marriages, 6529 European and 9752 non-European.

Education for white children from 7 to 16 years of age is compulsory unless the child is employed in a regular occupation and has passed the sixth standard. In 1930 there were 4906 schools for white children with 353,942 pupils, and 4038 schools with 382,707 colored and native pupils. The total ordinary revenue for 1931-32 was £4,495,752 including £2,646,001 received as a subsidy from the Union government; total ordinary expenditure amounted to £4,750,978. Provincial government is by an administrator, appointed by the Governor-General of the Union, assisted by the Executive Committee of 4 members and the Provincial Council of 58 elected members. In the Union Parliament at Cape Town the Province elects 8 members to the Senate and 58 members to the House of Assembly. Administrator in 1933, J. H. Conradie. See SOUTH AFRICA, UNION OF.

CAPE VERDE (vûrd) ISLANDS. A Portuguese dependency consisting of 14 islands divided into two groups (Windward and Leeward), 320 miles west of Cape Verde on the west coast of Africa. The islands of the Windward group are São Vicente, Santo Antão, São Nicolau, Santa Luzia, Sal, Boa Vista, Banco, and Raso; of the

Leeward group they are Sant'Iago, Maio, Fogo, Brava, Rei, and Rombo. Total area, 1511 square miles; total population (1929 estimate), 153,738 including 54,559 negroes, 94,977 mulattoes, and 4202 whites. There are 157 primary schools. The chief products are coffee, sisal, mustard, castor oil, oranges, brandy, and hides. Imports for 1931 were valued at 63,386,378 escudos (escudo equals \$0.0442 at par); exports, 2,313,499 escudos. The budget for 1932-33 estimated revenue at 19,417,650 escudos and expenditure at 19,399,873 escudos. Mindello, on the island of São Vicente, is the chief port and a transatlantic coaling station; 972 ships entered the harbor in 1931. A Governor administers the dependency from Praia, the capital, on the island of Sant'Iago. Governor in 1933, Col. Antonio A. G. Vaz.

CARBON DIOXIDE. See CHEMISTRY, INDUSTRIAL OR APPLIED.

CARCINOMA. See MEDICINE AND SURGERY.

CARDINALS. See ROMAN CATHOLIC CHURCH.

CARHAET, PAUL WORTHINGTON. An American lexicographer, died suddenly in Springfield, Mass., Oct. 27, 1933. Born at Jackson, Mich., Nov. 10, 1872, he was graduated from Yale University in 1894. Four years later he became associated with the G. and C. Merriam Co. as assistant editor of *Webster's New International Dictionary*, and apart from one year (1904-05) spent in research and study in England and Germany devoted all his time to this enterprise, rising to the rank of managing editor. He was a recognized authority on phonetics and pronunciation and contributed to the establishment of a standard speech in the United States.

CARINTHIA, ká-rin'thl-á. A province of the Republic of Austria bounded on the south by Italy and Yugoslavia, on the north by the Austrian provinces of Salzburg and Styria. Area, 3680 square miles; population (1923 census), 370,817; Klagenfurt, the capital, had 27,423 inhabitants. See AUSTRIA.

CARLETON COLLEGE. A coeducational institution of higher learning in Northfield, Minn., founded in 1866. The enrollment in the autumn of 1933 was 790. There were 63 faculty members. The endowment amounted to \$2,859,377, and the total income for the year was \$553,927. There were 104,000 volumes and 31,000 pamphlets in the library. President, Donald John Cowling, Ph.D., D.D., LL.D.

CARNEGIE CORPORATION OF NEW YORK. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable elsewhere than in the United States.

In 1933, as in the previous year, approximately two-thirds of the annual income of the corporation was devoted to a reduction of unpaid obligations, which on September 30 amounted to \$18,006,900. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1932-33 the sum of \$4,855,747 was appropriated. Of this amount \$1,186,300 was applied toward library service; \$227,500 toward the encouragement of adult education activities; \$722,550 toward the support of national organizations in the field of fine arts and of departments of art in colleges and universities and of projects for developing appreciation of the arts; \$992,187,

toward the support of educational and scientific studies and research publications; and \$1,727,209 toward general interests, including the Carnegie Endowment for International Peace.

The corporation continued to support various important projects, such as research in the study of cosmic rays, leukemia, velocity of light and vitamins, and study of susceptibility to infectious diseases. Various studies conducted by the American Historical Association and the American Law Institute were continued during the year. From the income of its \$10,000,000 fund, the corporation continued its five-year programme in British Africa, involving a total of \$500,000. This included scientific research, aid to Jeanes Schools, exchange of educational visits, and library service, carried on largely through responsible local bodies. Various educational enterprises in Canada, Australia, and New Zealand were also aided.

The trustees of the corporation in 1933 were: Newton D. Baker, James Bertram, Nicholas Murray Butler, Samuel Harden Church, Robert A. Franks, David F. Houston, Henry James, Frederick P. Keppel, Russell Leffingwell, John C. Merriam, John A. Poynton, and Elihu Root. Officers of administration were: Elihu Root, chairman of the board; Robert A. Franks, vice chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary; and Robert M. Lester, assistant to the president. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, THE. A foundation established in 1905 by Andrew Carnegie, who placed an endowment of \$10,000,000 in trust for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. Following its incorporation by Congress in 1906, its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908 and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York. On June 30, 1933, its endowments and accumulated reserves amounted to \$31,409,589, while it had distributed \$25,370,122 in retiring allowances and pensions to 1384 college teachers and 693 teachers' widows, chiefly through 95 associate institutions selected for their educational standing.

The foundation publishes extensive annual reports, which deal with many phases of the educational process. Its division of educational inquiry, established in 1913, has issued 27 comprehensive bulletins, dealing with medical, legal, engineering, dental, and vocational education, the training of teachers, American and British college athletics, and kindred subjects. In 1933 the foundation was engaged upon studies concerning State higher education in the United States, professional education, and the relations between secondary and higher education in Pennsylvania. Dr. Henry Suzzallo (q.v.) was president until his death on Sept. 25, 1933. Dr. Henry Smith Pritchett was president emeritus and Howard J. Savage, secretary in 1933. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE INSTITUTE OF PITTSBURGH. See ART EXHIBITIONS.

CARNEGIE INSTITUTE OF TECHNOLOGY. A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa. founded in 1900. The enrollment for the autumn of 1933 was 4119, including 2242 registered in the regular day courses and 1877 in the

evening courses. For the summer session 660 students were enrolled. The faculty numbered 301, of whom 251 were on full time and 50 on part time. The endowment of the institution was \$16,383,000 and the annual income \$840,000 (not including student fees). The institute is adjacent to the Carnegie Library of Pittsburgh, which has 450,600 volumes. President, Thomas Stockham Baker, Ph.D., LL.D., Sc.D.

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery and the application of knowledge to the improvement of mankind." Its major activities in 1933 were carried on through the following departments and divisions: Department of embryology (located in the Hunterian building of the Johns Hopkins University medical school); department of genetics (laboratory at Cold Spring Harbor, Long Island, N. Y.); geophysical laboratory; division of historical research, including the sections of aboriginal American history, United States history, and history of science; department of meridian astrometry (headquarters at the Dudley Observatory, Albany, N. Y.); Mount Wilson Observatory, in Pasadena, Calif.; nutrition laboratory, in Boston; division of plant biology (central laboratory at Stanford University); department of terrestrial magnetism; Tortugas (Fla.) Laboratory of Marine Biology.

Problems relating to human growth and development, especially the growth of individual cells and body tissue, behavior of chromosomes, nutrition and metabolism, and influences of hormones formed by glands of internal secretion, continued to occupy the attention of biological groups. In studies of the physics of matter there were conducted investigations of the physics and chemistry of the sun and stars, conditions of interstellar space, conditions of the earth's interior, and physical phenomena at various localities on the earth's surface and in the atmosphere.

Correlated investigations concerned penetrating radiation or influence of the cosmic rays and fundamental questions of atomic physics, a new building having been erected by the department of terrestrial magnetism where there were conducted such researches as bombardment of the atom. Investigations on the history of the Maya people and their culture in Middle America included all phases of knowledge bearing upon these questions.

Total receipts of the institution, representing interest on investments and bank balances, and sales of publications, amounted to \$1,651,275 for the year. During 1933 the executive committee authorized publication of 24 new volumes. The institution made known the results of its work through technical and scientific journals, its *Year Book*, and a series of scientific monographs and news releases.

The president in 1933 was John C. Merriam. The officers of the board of trustees were: Elihu Root, chairman; Henry S. Pritchett, vice chairman; Frederic A. Delano, secretary. The executive committee included: Henry S. Pritchett, chairman; Frederic A. Delano, W. Cameron Forbes, Cass Gilbert, John C. Merriam, Frederic C. Wolcott, Stewart Paton, and Elihu Root. Headquarters are at Sixteenth and P Streets, N. W., Washington, D. C.

CAROLINE ISLANDS. An archipelago of about 549 coral islands in Micronesia, Pacific Ocean, extending from the Philippine Islands eastward to the Marshall Islands, having a total area of about 550 square miles, transferred from Germany to Japan under mandate of the League of Nations by the Versailles Peace Treaty. Total population about 38,647. The islands have been divided into two groups for administrative purposes (1) Eastern Carolines, with Truk (15,973 inhabitants) and Ponapé (8910) as administrative centres; (2) Western Carolines, with Palau (8101) and Yap (6735) as centres for administrative purposes. Yap is an important wireless and cable station. The chief exports are sugar, copra, and phosphate.

CARRIER-BELLEUSE, kă'r'ya-bél'üz, **PIERRE ALBERT GÉRARD.** A French painter, died Jan. 1, 1933, in Paris where he was born Jan. 29, 1851. A son of Albert Ernest Carrier-Belleuse, the sculptor, he studied at the École des Beaux Arts under Cabanel and in the atelier of Galland, the decorator, and after 1875 was a regular exhibitor at the Salon. His versatility was displayed in his landscapes and genre studies, his portraits, and his pastels and paintings of dancing figures and nudes, many of which were purchased by the French government and placed in museums in France and abroad. Among the more noteworthy of these were: "Au Soleil fantaisie" (at Le Puy); "Une Danseuse" (La Rochelle); "Le Bonnet d'âne" (Mulhausen); "Le Miroir" (Versailles); "La Danseuse attachant son soulier" (Dunkirk); and "Tendre aveu" (Museum of the City of Paris). He contributed also to *Figaro* and other illustrated journals.

Carrier-Belleuse gained special renown for his three great panoramas—"Lourdes" (1880), "Jeanne d'Arc" (1889), and "Le Panthéon de la Guerre" (1919). The latter, executed in collaboration with Auguste François Gorguet, was painted during the four years of the World War for the purpose of keeping up the morale of the French people. It contained 6000 portraits of Allied generals, heroes, statesmen, and members of royal families, grouped by countries against a panorama of the Western Front, and enabled some 20 artists who were unable to bear arms to perform a patriotic service. In 1927 the enormous canvas, measuring 396 by 45 feet, was brought to the United States for exhibition in New York and other cities, and in 1931 was purchased by citizens of Washington for display during the Washington Bicentennial.

Among the honors conferred on Carrier-Belleuse were officer of the Legion of Honor, chevalier of the Order of Leopold of Belgium, and commander of the Order of Danilo of Montenegro. He was also a past president of the International Society of Painting and Sculpture.

CASE SCHOOL OF APPLIED SCIENCE.

An engineering college in Cleveland, Ohio, founded in 1880. In the autumn of 1933 the enrollment was 625. The 1933 summer session registration was 117. The faculty numbered 79. The endowment amounted to \$4,500,000, while the net income for the year was \$118,617. The library contained 25,000 volumes. President, William Elgin Wickenden, D. Eng., D.Sc. LL.D.

CASUALTY INSURANCE. See INSURANCE.

CATALONIA (CATALUNA). An autonomous region occupying the northeastern corner of the Spanish Republic, comprising the Provinces

of Barcelona, Gerona, Lérida, and Tarragona. The area is 12,427 square miles. The population on Dec. 31, 1931, was estimated at 2,798,751. Barcelona, the capital and chief city, had 991,262 inhabitants on the same date. The city is the centre of a thriving industrial, commercial, and agricultural region. Catalonia's autonomous status was defined in the Catalan Statute approved by the Spanish Cortes Sept. 15, 1932. It provided for a Parliament of 85 members, a President elected by the Parliament, and an Executive Council. Castilian (Spanish) and Catalan are official languages. The first Parliament was elected Nov. 20, 1932, and convened Dec. 6, 1932. President in 1933, Col. Francisco Macia, elected Dec. 14, 1932. For developments in 1933, see SPAIN under *History*.

CATHOLIC UNIVERSITY OF AMERICA, THE. A national institution of higher education in Washington, D. C., founded in 1887 by the Roman Catholic hierarchy with the approval of the Holy See. The enrollment for the autumn term of 1933 was 1388, distributed in the following schools: Graduate school of sacred sciences, 23; seminary, 100; canon law, 25; law (coeducational), 64; engineering, 142; arts and sciences, 397; and graduate school of arts and sciences (coeducational), 637. The enrollment for the summer session (coeducational) of 1933 was

CEMENT. The preliminary estimates of production for the Portland cement industry in the United States, compiled by the U. S. Bureau of Mines, showed decreases of 17.4 per cent in production and 20.7 per cent in shipments during the year below the final totals for 1932. The production in 1933 was estimated at 63,373,000 barrels as against a final total of 76,741,000 barrels in 1932, and the shipments from mills at 64,086,000 barrels against 80,843,000 barrels in 1932. During the calendar year the production as related to mill capacity was 23.6 per cent as against 28.3 per cent in 1932. In addition to Portland cement, the production of clinker (unground Portland cement) was 62,965,000 barrels as compared with 75,004,000 barrels in 1932.

Exports of hydraulic cement from the United States in 1932 were 374,581 barrels, valued at \$802,205, with imports for that year amounting to 462,496 barrels valued at \$351,033. For the first eleven months of 1933 exports were 614,486 barrels valued at \$1,336,572, with imports for the same period of 416,479 barrels valued at \$342,110.

ESTIMATES OF PRODUCTION AND SHIPMENT OF FINISHED PORTLAND CEMENT BY DISTRICTS
[Quantities in thousands of barrels]
(U. S. Bureau of Mines, Revised, Jan. 13, 1934)

Districts	Production		Shipments	
	1933	1932	1933	1932

1131. Affiliated with the university is the Catholic Sisters' College (205 students); Trinity College for Women (285 students); National Catholic School of Social Service (48 students); and 34 religious houses of study in the immediate vicinity with an enrollment of about 1050 students. In addition, there are affiliated throughout the United States 5 seminaries, 33 colleges, 203 high schools and academies, 4 junior colleges, 4 normal schools, and 56 novitiates.

The university is governed by a board of trustees (archbishops, bishops, priests, and laymen) through the rector, who is advised by an academic senate composed of representatives (lay and clerical) of the various faculties. The faculty of the university proper numbered 148, of whom 34 were full professors. The endowment amounts approximately to \$3,300,000, plus an annual collection of about \$345,000. The library contained 319,000 volumes. Administrative officer: The Most Rev. Michael J. Curley, S.T.I., chancellor; the Most Rev. James H. Ryan, Ph.D., S.T.D., LL.D., Litt.D., rector; the Rt. Rev. Edward A. Pace, Ph.D., S.T.D., LL.D., vice rector; the Rt. Rev. David T. O'Dwyer, procurator; and Prof. Richard J. Purcell, Ph.D., general secretary.

CENTENARIES. The centenary of the death of William Wilberforce and of the passing of the Act for the abolition of slavery within the British possessions, was marked by special services, including one in St. Paul's Cathedral on Sunday afternoon, July 16. At Hull there was a procession past the birthplace of Wilberforce and the Hull Grammar School where he was educated, and the Archbishop of York preached at Holy Trinity Church. There was also a service at Westminster Abbey, while the Bishop of Rochester preached at the Parish Church, Keston, Kent, which village includes Holmwood Park, where stands an oak tree beneath which Wilberforce made his first resolution to proceed with the agitation for the abolition of slavery.

Another centenary observed in July was that of King William's College, Isle of Man, the Archbishop of York preaching in the college chapel. The Tercentenary of George Herbert, the parson-poet, was celebrated at Fugglestone Church, near Salisbury, by a special service at Montgomery Church in which the Archbishop of Wales took part, and at Westminster Abbey. The White Cross League celebrated its jubilee in December. The jubilee of the Restoration of the

THE NEW STANDARD DICTIONARY "WITH THE ELECTRIC EYE"

A feature in the exhibit of the Funk & Wagnalls Company. A moving ribbon at the top carries a list of words. When one appears that interests the visitor he breaks the beam of light projected from the hole in the base by interposing his hand or some other object. Actuated by a selenium cell the enlarged replica of the Dictionary then opens to the page upon which the definition of the word is found.

English Church at The Hague was observed on October 19. See also CENTURY OF PROGRESS EXPOSITION.

CENTRAL AMERICA. The term generally applied to the southern portion of the North American Continent lying to the north of the Panama Canal and south of the Isthmus of Tehuantepec in Southern Mexico, and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador, and the British crown colony of British Honduras. See the articles on these respective countries.

CENTRAL AUSTRALIA. See NORTHERN TERRITORY OF AUSTRALIA.

CENTRAL VALLEY CONSTRUCTION PROJECT. See DAMS.

CENTURY OF PROGRESS EXPOSITION.

As announced in the NEW INTERNATIONAL YEAR BOOK for 1932, the city of Chicago, Ill., celebrated its hundredth anniversary by the opening of an exhibition which was designed to portray the advancements in arts, science, and industry in the hundred years that had passed since the date of the founding of the city. The exposition was located on the shore front of Lake Michigan, much of it on islands and causeways dredged up from the Lake, and stretched from Twelfth Place, near the heart of the city, southward about 3½ miles to Thirty-ninth Street. Specially built busses to accommodate a hundred passengers carried visitors to various points. In the main, the buildings for housing exhibits were huge structures, impressive more by size and architectural originality and daring than by beauty. The sheer starkness of wall, unrelieved by window openings, was in part overcome by a lavish use of vivid color, by great figures in bas relief, and by a liberal use of columns, panels, buttresses, and lines. Such architectural treatment, almost glaring by day, lent itself beautifully to a brilliant illumination by night that transformed buildings and grounds into a fairyland of color and light. This was accomplished by the use of millions of incandescent lights, by artfully placed flood lights in varying colors, and by the employment of literally miles of neon tubes. The lake front was transformed into a multi-colored panorama of light, with electrical cascades, flaming pylons, and scintillating colors.

Among the most impressive of the buildings were: the Administration Building, a modernistic "E" shaped structure; the Hall of Science, a great "U" shaped building on Leif Ericson Drive; the unique Travel and Transport Building, whose dome was supported by cables rather than pillars. Located on Northerly Island was the Electrical Group, composed of three units—the Radio, Communications, and Electrical Buildings. Among other prominent structures were included the Agricultural Group, the Music Group, in which the greatest music festival in the history of America was offered to visitors, the Court of the States, an international village, numerous buildings for industrial exhibits, and a miniature city demonstrating housing conditions. Especially interesting was the replica of old Fort Dearborn whose log battlements stood in vivid contrast to the skyscrapers of Michigan Boulevard. The story of the Indian from his primitive state to his most highly developed civilization was also shown. A large zone was devoted to amusements of every description, and the sports programme planned was most varied.

A Century of Progress was fortunate in having

a heritage of permanent buildings near the Fair grounds—the Field Museum, the Shedd Aquarium, the Adler Planetarium, and the Art Institute. Soldier Field, the great stadium for athletic exhibits and contests was also near by.

More than \$38,647,836 was invested in the construction of buildings, the preparation and installation of exhibits, attractions, and organization expense prior to its opening by A Century of Progress and by governments, exhibiting corporations and concessionaires who participated in the 1933 World's Fair. The Exposition expended \$4,783,839 in operating and maintaining the Fair for the 170 days of its duration. The cost of operation by governments, exhibiting corporations, and concessionaires undoubtedly exceeded that figure. Combined, these expenditures would total at least \$10,000,000. More than \$37,270,000 was spent by visitors for gate admissions and concessions. (Of this, \$27,985,518 represented concessions and \$10,175,007 admissions.) The Exposition sold 22,565,859 admissions, of which 245,403 tickets were unredeemed.

The success of the 1933 Exposition in a time of grave uncertainty was a demonstration that the nation's powers and resources were unimpaired. The importance of a Century of Progress Exposition in encouraging the nation's economic upturn was evident in the stimulation which it imparted to transportation. More than 4,000,000 passengers were brought to Chicago by the railroads during the 170 days' duration of the Fair. Figures compiled by the passenger associations covering the operations of 11 railroads reaching Chicago show that 24,240 extra railroad and Pullman cars were required to handle this traffic in addition to the normal complement of the various trains. Six railroads alone reported that nearly 5000 extra men were employed in various branches of the service. In addition to the visitors who were brought by rail, it is estimated that 4,000,000 people came to Chicago by automobile during the Exposition, and that 1,000,000 were brought by motor bus.

A complete check-up of actual exhibit attendance was not possible, but estimates and records compiled by some of the exhibitors revealed interesting results. One of the leading automobile manufacturers reported that 10,000,000 people, or nearly 50 per cent of the total paid admissions to the Fair, had visited their building and viewed their exhibit. A similar number were reported to have visited the special building and exhibit of a leading tire and rubber manufacturer. Records of a great mail order company indicated that 7,000,000 visitors had entered its special building and saw its exhibits. Five million people, it was estimated, visited the exhibit of an electric and manufacturing company in the Electrical Building. Two exhibit trains in the outdoor transportation area recorded a combined attendance of visitors in excess of 5,000,000. Between 12,000,000 and 15,000,000 people are believed to have visited the exhibits in the States Building. The largest percentage of all people entering the grounds, it is believed, visited the Hall of Science.

Approximately 22,000 people were employed on the grounds of a Century of Progress during the peak of the operating period in 1933. It is estimated that jobs for approximately 100,000 workers were created either directly or indirectly in Chicago and adjoining areas during the Exposition as a result of its operations. Of the persons employed on the Fair grounds, 8777 were

employed by the Exposition and 15,000 by exhibitors and concessionaires. During the pre-Fair period thousands of persons were employed by contractors in the construction of the Exposition and in the preparation and installation of exhibits and concessions.

The Exposition exerted such a profound influence during its 1933 operation that a demand for its continuance in 1934 was made by civic bodies, business organizations, and leading citizens in Chicago and elsewhere. It was believed that the Exposition had the effect of encouraging education on a widespread scale, that it benefited business materially, and was an important contributor to the nation's economic upturn. Hence, its sponsors announced that A Century of Progress Exposition will reopen its gates on June 1, 1934. See ART EXHIBITIONS; ELECTRICAL ILLUMINATION; ARCHITECTURE.

CERMAK, châr'mäk, ANTON JOSEPH. An American politician, died in Miami, Fla., Mar. 6, 1933. He was born at Kladno, Bohemia (now part of Czechoslovakia), May 9, 1873, and a year later was brought by his parents to the United States where they settled in the coal-mining town of Braidwood, Ill. At the age of 11 he began work in a mill, and when 12 became a mule driver in the coal mines. Discharged two years later for taking part in a strike, he was successively a railroad brakeman and teamster. In 1892 he engaged in the coal and wood business in Chicago, leaving it in 1908 to enter the real estate field as a member of the firm of Cermak and Serhant. After 1907 he was president of the Lawndale Building and Loan Association.

Early interested in politics, Mayor Cermak was elected a member of the House of Representatives of the 43d, 44th, 45th, and 46th Illinois General Assemblies. From 1912 to 1918 he served on the Chicago City Council and from 1922 to 1931 was president of the Cook County Board of Commissioners. In 1931 he was overwhelmingly elected on the Democratic ticket for a four-year term as mayor of Chicago. One of his first and most important acts was to reduce municipal expenditures in an attempt to bring order out of the city's financial chaos, the legacy of the Thompson administration. He also strove for greater efficiency in government so as to re-establish the city's credit, and preparatory to the opening of the Century of Progress Exposition was successful in curbing the activities of its gangsters, bootleggers, gamblers, and grafters, winning thereby for Chicago a new and more genuine respect both nationally and internationally.

Mayor Cermak was taking a vacation in Miami when President-elect Franklin D. Roosevelt arrived there on Feb. 15, 1933. In the attempt to assassinate Mr. Roosevelt made by Giuseppe Zangara, a half-crazed hater of officialdom, Cermak received one of the bullets, and after a vigorous struggle for life succumbed 19 days later. The world will long remember his gallant words to Mr. Roosevelt: "I am mighty glad it was me instead of you."

CERRETTI, BONAVENTURE, CARDINAL. A prince of the Roman Catholic Church, died in Rome, May 8, 1933. He was born at Orvieto, Italy, June 17, 1872, and, after attending the Pontifical Seminary at the Vatican, was ordained a priest in 1895. In 1904 he started his career in the Papal diplomatic service, first, until 1906, as secretary of the Apostolic delegation to Mexico

and then, until 1914, as auditor of the Apostolic delegation in Washington, D. C. In this service he traveled extensively throughout the United States and familiarized himself with the character and conditions of the American people. In 1914 he was created Archbishop of Corinth, and Apostolic Delegate to Australasia. In 1917, as Papal Secretary for Extraordinary Affairs, he carried out programmes for ameliorating the condition of prisoners of war, and during the Paris Peace Conference acted as Papal envoy in the interests of Catholic missions.

Upon the reestablishment of diplomatic relations between the Vatican and France in 1921 Cerretti was sent to Paris as Papal Nuncio, and in the next five years was so notably successful in overcoming anti-clerical opposition that the French government honored him with the Grand Cross of the Legion of Honor. In 1925 he was created a Cardinal and three years later went to the Eucharistic Congress at Sydney, New South Wales, Australia, as Papal Legate. In 1931 he was made keeper of the Papal Seal, and in 1933 was proclaimed a Cardinal-Bishop.

CEYLON, sê-lôn'. A British island crown colony in the Indian Ocean, southeast of the southern tip of India. Total area 25,332 square miles; population (exclusive of military and shipping) 5,306,863 at the partial census of Feb. 26, 1931. In 1931 there were 199,170 registered births; 117,453 registered deaths; 24,544 registered marriages (exclusive of Moslem marriages which are seldom registered). The population of the chief cities (excluding the military, shipping, and estates) at the census of 1931 was: Colombo, the capital, 284,155; Jaffna, 45,708; Galle, 38,424; Kandy, 36,541. Education is free in the vernacular schools; attendance at 1528 primary schools was 586,047 for 1931.

PRODUCTION. Agriculture is the chief industry, about 3,200,000 acres are devoted to the cultivation of rubber, tea, rice, cacao, tobacco, coconuts, spices, areca nuts, and sugar cane. Large quantities of rice are imported. In 1931 livestock included 1,580,000 horned cattle, 194,000 goats, 65,000 sheep, 41,000 swine, and 1100 horses. Plumbago mines reported working at the end of 1932 numbered 22, and some monazite and small-gem deposits are exploited. Manufacturing is confined to the production of agricultural commodities such as coconut oil, cacao, rubber, etc.

COMMERCE. Due mainly to the fall in world prices the value of foreign trade for 1932 continue to show a decline; excluding specie, imports totaled 196,202,961 rupees and exports totaled 173,208,745 rupees (rupee averaged \$0.2635 for 1932). Great Britain took 49 per cent of the exports and supplied 19 per cent of the imports.

FINANCE. Exclusive of railway earnings and expenses, government revenue for 1931-32 totaled R,84,843,207; government expenditure totaled R,97,056,079. Railway revenue was R,22,024,335 and railway expenditure was R,20,587,646. On Sept. 30, 1932 the net total public debt was R,130,043,195.

COMMUNICATIONS. At the end of 1932 there were 951 miles of railway open to traffic; several new lines were surveyed. There are about 16,500 miles of highways and 8200 miles of bridle paths. There were 3778 ships aggregating 12,160,339 tons entered the ports in 1932.

GOVERNMENT. The administration of the island is in the hands of a governor, aided by a state

council, having both executive and legislative functions, consisting of 61 members of whom 50 are elected, 8 are nominated unofficial members, and 3 officers of state (chief secretary, legal secretary, and financial secretary). Only 46 of the 50 electoral seats were filled at the general election of June 1931, as 4 constituencies in the Jaffna Revenue District failed to nominate candidates. Governor Sir Graeme Thomson, who died on Sept. 28, 1933, was succeeded by Sir R. E. Stubbs.

MALDIVÉ ARCHIPELAGO. A chain of coral islands (atolls) about 400 miles southwest of Ceylon. Land area about 115 square miles; population (census of 1931), over 79,000 Moslems. The chief products are millet, coconuts, coconut fibre, cowrie shells, tortoise shell, and esculent roots. Government is in the hands of an elected native Sultan, who resides on the island of Malé. The islands pay an annual tribute to the Ceylon government.

CHAMBER OF COMMERCE OF THE UNITED STATES. A national federation of trade associations and local or regional commercial organizations, established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. The membership in 1933 consisted of 1251 business organizations, 4100 individual members, and 2824 associate members.

The chamber maintains at its national headquarters in Washington 12 service departments, covering the main divisions of business activity. The agriculture department aids local chambers of commerce in the solution of agricultural problems and the enhancement of trade-area prosperity. The civic development department aids business men to approve not only local municipal and civic development but matters of general national importance. The commercial organization department assists member chambers in strengthening their organizations and extending their usefulness to the communities which they serve. The department of manufacture assists member organizations with their problems of industrial extension. The domestic distribution department promotes better methods of distribution. The finance department studies methods of Federal, State, and local taxation and problems of corporation and international finance.

There are also the foreign commerce department which deals with tariff policies and import and export problems; the insurance department which works to secure a more enlightened public attitude toward the insurance institution; and the natural resources production department which deals with the problems of water power, oil, coal, forest, and other natural resources. The trade association department serves as a clearing house as to the activities which a trade association can carry out most effectively, while the transportation and communication department studies problems of rail, highway, waterway, and air transportation and of postal service and electrical communications. The research department covers the general field of economic research, issues from time to time reports on economic subjects, and publishes a monthly magazine, *The Nation's Business*.

The chamber's twenty-first annual meeting was held in Washington, D. C., May 2-5, 1933. The officers elected for the year 1933-34 were: president, Henry I. Harriman, Boston, Mass.; honorary life vice-president, John Joy Edson, Washington, D. C.; vice-presidents, Matthew S. Sloan, Brooklyn, N. Y., Junius P. Fishburn, Roanoke, Va., Felix M. McWhirter, Indianapolis, Ind., F. Peavey Hefelfinger, Minneapolis, Minn., Wm. V. Hodges, Denver, Colo., Paul Shoup, San Francisco, Calif.; members of the senior council, Richard F. Grant, New York City, John W. O'Leary, Chicago, Ill., Lewis E. Pierson, New York City, William Butterworth, Moline, Ill., Silas H. Strawn, Chicago, Ill.; treasurer, Robert V. Fleming, Washington, D. C.; chairman of the executive committee, Henry I. Harriman, Boston, Mass.; and secretary, D. A. Skinner, Washington, D. C. National headquarters are in Washington, with divisional headquarters in New York City, Atlanta, Chicago, Minneapolis, Dallas, and San Francisco.

CHAMBERS, ROBERT W (ILLIAM). An American novelist, died in New York City, Dec. 16, 1933. He was born in Brooklyn, N. Y., May 26, 1865, and began his career as an artist after studying at the Académie Julian, Paris, during 1886-93. He became an illustrator for various New York weeklies, including *Life*, *Truth*, and *Vogue*, but soon practically abandoned the brush for the pen. From the historical-romantic style which he adopted in his early novels he became known as the American Anthony Hope (q.v.). Among the more successful of his 72 novels were: *In the Quarter* (1893); *The King in Yellow* (1893); *The Red Republic* (1894); *A King and a Few Rulers* (1894); *The Maker of Moons* (1895); *Lorraine* (1896); *The Cambric Mask* (1899); *The Conspirators* (1900); *Cardigan* (1901); *The Maid-at-Arms* (1902); *The Fighting Chance* (1906); and *The Firing Line* (1908).

After 1910 Mr. Chambers turned more and more to the so-called society type of novel, publishing *Aulsa Page* (1910); *The Green Mouse* (1910); *Streets of Ascalon* (1912); *Adventures of a Modest Man* (1913); *The Common Law* (1913); *Gay Rebellion* (1913); *The Business of Life* (1913); *The Hidden Children* (1914); *The Better Man* (1915); *The Dark Star* (1915); *The Restless Sea* (1917); *In Secret* (1918); *The Crimson Tide* (1919); *Slayer of Souls* (1920); *Little Red Foot* (1921); *The Hi-jackers* (1923); *The Girl in Golden Rags* (1924); *The Man They Hanged* (1925); *The Drums of Aulone* (1926); *The Sun Hawk* (1927); *The Rogues' Moon* (1927); and *The Happy Parrot*. He wrote also a play, *The Witch of Ellangowan*, in which Ada Rehan appeared at Daly's Theatre, New York City, in 1897. In 1913 a musical comedy adaptation of his novel *Iole* (1905) was produced. He was a member of the National Institute of Arts and Letters.

CHAPMAN, JOHN JAY. An American author, died at Poughkeepsie, N. Y., Nov. 4, 1933. Born in New York City in 1862, he was graduated from Harvard in 1884 and practiced law for ten years after his admission to the bar in 1888. On the successful reception of *Emerson and Other Essays and Causes and Consequences* in 1898 he turned definitely to literature, achieving fame

for the marked originality and felicity of expression of his work. Outstanding among his volumes of essays were: *Learning and Other Essays* (1911); *Greek Genius and Other Essays* (1915); *A Glance toward Shakespeare* (1922); *Letters and Religion* (1923); and *Dante* (1927). He wrote in verse *Homeric Scenes* (1914) and the plays, *The Maid's Forgiveness* (1908); *A Sausage from Bologna* (1909); and *Benedict Arnold: A Play for a Greek Theatre* (1909). In 1913 he published a biography of William Lloyd Garrison and in 1915 his memoirs under the title of *Memories and Milestones*.

CHAUTAUQUA INSTITUTION. An educational movement established at Chautauqua, N. Y., in 1874 by Lewis Miller and Bishop John H. Vincent, both prominent in the Methodist Episcopal Church. Its original idea was that of an assembly for Sunday school teachers, but it was gradually developed into an institution affording during the summer months a series of correlated lectures and entertainments. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, symphony orchestra and other concerts, operas, plays, and so forth; the summer school, offering in its 18 departments credit courses under the direction of New York University; and a home-reading circle, in which four or more outstanding books are designated for reading during the year, in addition to a news narrative appearing in a monthly review. The attendance at the annual session is approximately 40,000, while the enrollment in the summer school is about 1500. The officers in 1933 were: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ranson, chairman of trustees; Shailer Mathews, chairman of the executive board; Charles E. Pierce, secretary; and Jessie M. Leslie, treasurer.

CHELMSFORD, chémz'fêrd, FREDERIC JOHN NAPIER THESIGER, 1st VISCOUNT. A British administrator, died in London, Apr. 2, 1933. Born Aug. 12, 1868, he was educated at Oxford, where he studied law at Magdalen College and was Fellow of All Souls College from 1892 to 1899. In addition to his law practice he served as a member of the London School Board (1900-04) and of the London County Council (1904-05). In 1905, when he succeeded his father to the title as 3d Baron Chelmsford, he was appointed Governor of Queensland, Australia. In 1909 he was transferred to the governorship of New South Wales, where he remained until 1913. After serving in India with the Dorsetshire regiment during the early part of the World War he was appointed Viceroy of that country in 1916.

Chelmsford's five-year incumbency of the viceroyalty was distinguished by the report on certain constitutional changes for the extension of India's self-government, which he drew up in co-operation with Edwin S. Montagu, Secretary of State for India. This report, after advocating complete responsibility in local affairs and partial responsibility in provincial affairs, visioned a United States of India, self-governing in all matters of purely provincial interest and presided over by a central authority, representative of and responsible to the people of the whole country. It was approved by the Indian government and certain of its provisions were carried out in 1920-21 through the appointment of new governors for the provinces and the replacement of the viceroy's legislative council by two new

representative bodies in Parliament, the Council of State and the Imperial Legislative Assembly, composed largely of members directly elected by the constituencies. It was rejected, however, by the Indian National Congress under Gandhi, and this congress after the Amritsar disturbances of 1919 recommended the recall of the Viceroy.

On his retirement in 1921 Chelmsford was created a viscount. He had previously been made Knight Commander of St. Michael and St. George (1906), Knight Grand Commander of the Indian Empire (1916), Knight Grand Commander of the Star of India (1916), and Knight of the Grand Cross of the Order of the British Empire (1918). During the last decade of his life he held the portfolio of First Lord of the Admiralty in Ramsay MacDonald's Labor Ministry of 1924, was Agent General for New South Wales in London during 1926-28, and in 1930 was elected warden of Winchester College and in 1932 of All Souls College, Oxford.

CHEMICAL INDUSTRY, SOCIETY OF. See CHEMISTRY, INDUSTRIAL OR APPLIED.

CHEMISTRY. During 1933 distinct progress was made in the field of chemistry. Among the most notable achievements was the preparation of "heavy" water, together with a study of its properties and its effect upon organisms. Marked advances were made also in the study of the structure of matter and of transmutation. The neutron and the positron are of particular interest. These advances and many others are outlined in the account which follows.

THE ATOM AND ITS TRANSFORMATION. According to present knowledge, an atom appears to be composed of the following building "blocks":

(1) *Protons.* The proton is electrically positive and is a hydrogen atom which has lost an electron (H^+). Its weight is approximately 1 (oxygen = 16).

(2) *Electrons.* The electron is electrically negative. Since a hydrogen atom weighs as much as about 1850 electrons, the weight of the electron is negligible.

(3) *Neutrons.* The neutron is electrically neutral and has a mass which is estimated to be slightly greater than unity. It appears to consist of a proton and an electron bound or packed together. We are not certain what the neutron is, but its mass is about that of the proton. Artificial production of considerable quantities of neutrons has been accomplished at the California Institute of Technology. The metal beryllium was disintegrated by means of alpha-particles, or nuclei of helium atoms (He^{++}).

(4) *Positrons.* Blackett and Occhialini, of the Cavendish Laboratory at Cambridge University, announced in February, 1933 that cosmic rays consist in part of *positive electrons*. The findings of these investigators in some respects were not entirely new, for Carl D. Anderson, of the California Institute of Technology, in the autumn of 1932, reached the tentative conclusion that cosmic rays include positive particles. The name *positron* has been given to the positive electron. It has the charge of a proton but the mass of an electron. Positrons are produced in certain types of collision processes. They appear to originate in some type of atomic or nuclear process brought about by the incident cosmic radiation. Positrons are also produced when the radiation from a beryllium target is bombarded by alpha-particles. It may be that the positron is of great importance in building up atomic nuclei.

The mass of the atom depends almost entirely upon the nucleus. While the atom is exceedingly small, it is immensely larger than the nucleus. Not only does the nucleus hold the mass of the atom, but it is the centre which holds the rest of the atom together. Outside the nucleus there is relatively an enormous volume filled with almost nothing.

In order to bring about transmutation a successful attack must be made upon the nucleus of an atom.

The recent discovery by Cockcroft and Walton, at the Cavendish Laboratory, that high velocity protons have a remarkable effect in producing atomic transmutations has led to a great extension of work in this field.

In order to accomplish atomic transmutation it is necessary to change in some way the structure of the nucleus. This may be done by adding to or subtracting from the nucleus one of its constituent particles, "whether a proton, neutron, alpha-particle or electron, or to substitute one of these particles for one of the existing units of the nuclear structure." It is therefore necessary for one of these particles to penetrate the atomic nucleus or heart of the atom. In order to get through the formidable defenses of the nucleus, the particles must move with very high velocities—of the order of 10,000 kms/sec.

As far back as 1919 Rutherford and Chadwick, of Cambridge University, bombarded certain light elements with alpha-particles from radioactive bodies, and it was observed that an alpha-particle occasionally entered the nucleus, leading to the expulsion from it of a swift hydrogen nucleus, or proton. It appeared that only about one alpha-particle in a million was effective in disintegrating the nucleus.

In later experiments protons were found to be effective in disintegrating the nucleus. It is important to produce *high-speed* protons, for the probability of a proton entering a nucleus diminishes with decreasing velocity and with increasing mass of the nucleus subjected to bombardment. Gamow advanced a theory which showed that, "whilst alpha-particles would require to be accelerated by potentials of the order of five million volts to penetrate a light nucleus, protons accelerated by one-tenth of this voltage ought to be almost as efficient, owing to their smaller mass and charge."

Let us now consider some of the types of transformation which are produced by the bombardment of atomic nuclei.

In the case of alpha-particles it is believed that an alpha-particle is occasionally captured by an atomic nucleus. This produces a violent disturbance, followed by the expulsion of one of the constituent protons at high speed. Thus, in the case of nitrogen the alpha-particle, which is a helium nucleus (He^{++}) of mass 4 carrying two charges, is captured by the nitrogen nucleus of mass 14 and charge 7, and a proton of mass 1 and charge 1 is expelled. The changes which occur may be illustrated as follows:

As a result of the change a new nucleus is formed of mass 17 and charge 8, which is an isotope of oxygen.

Since the neutron has no charge, it is able to pass freely through the outer structure of atoms and can penetrate deeply into matter. It is therefore a very efficient projectile in the transformation of other atoms. For example, oxygen, which is apparently not affected by bombardment either by alpha-particles or protons, is disintegrated by the neutron, an alpha-particle being emitted. The following relation has been suggested:

An isotope of carbon (C^{13}) is formed.

The proton has been found to be quite efficient in the disintegration of light metals. In general, it has been observed that when a proton enters a nucleus an alpha-particle is expelled. Thus, when lithium (Li^7) is bombarded by protons, it

appears that the lithium nucleus captures a proton, two alpha-particles being formed:

When boron is subjected to a stream of protons, it is probable that the following relation holds:

It thus appears that the boron isotope of mass 11 occasionally captures a proton and then disintegrates into three alpha-particles.

Deutons, the nuclei of the heavy hydrogen atom, H_2 , are very effective in bombarding substances. They are fired at high voltage. When deutons are used instead of helium nuclei (He^{++}), there are released from beryllium 500 times as many neutrons as ever before obtained. The deuton apparently penetrates the nucleus of the beryllium atom and transforms it into boron. When lithium was bombarded by deutons, it yielded neutrons even in greater abundance than did beryllium, helium being the by-product.

Since neutrons are knocked out at very high voltages they would appear to be the ideal tool in atomic disintegration.

Professors F. Paneth and P. L. Günther, of the University of Königsberg, reported in *Nature* that they had obtained the first *chemical evidence* of artificial transmutation. They passed helium (He^{++}), given off by thorium B and thorium C, through paraffin and got a surplus of helium—in some cases as much as 100 per cent increase. They were able to detect the helium by very refined chemical methods.

ENERGY INTO MASS. According to the theory of relativity, as propounded by Einstein, mass is potential energy, and energy is potential mass. The Einstein formula is as follows: $Mc^2 = E$. Stated in words, we have mass (in grams) times the square of the velocity of light (in centimeters per second) equals energy (in ergs).

Last year, in Paris, the Curie-Joliot's bombarded lithium by alpha-particles, neutrons and boron atoms being produced. According to K. T. Bainbridge, of the Bartol Research Foundation laboratories at Swarthmore, Pa., the production of boron atoms and neutrons when alpha-particles strike lithium atoms, confirms Einstein's formula; for an alpha-particle has an atomic weight which may be called 4, while one of the isotopes of lithium has an atomic weight of practically 7. Now, if the two particles merge during bombardment, their combined weight would be almost 11. In case the alpha-particle and the lithium atom merge, they at once break up into a boron atom and a neutron, the combined masses of which are infinitesimally more than the combined masses of the lithium atom and alpha-particle. What is the source of the additional mass? Bainbridge suggests that it is from the kinetic energy produced when the alpha-particle strikes the lithium atom. In other words, energy is transformed into mass.

When cosmic rays are turned on atoms, *positrons* are produced; also, the gamma rays of radium. Cosmic rays and gamma rays are energy, both being forms of light. It has been suggested that somewhere outside of the nucleus energy is creating particles of matter (positrons).

HEAVY HYDROGEN AND HEAVY WATER. The discovery of an isotope of hydrogen (heavy hydrogen; H_2) was made by Urey, Brickwedde and Murphy about two years ago. The different atoms of hydrogen have different masses because their atomic nuclei are different. At first the nucleus

of H^2 was regarded as being made up of two protons and one electron (p_e). The discovery of the neutron and the positive electron (positron) has given alternative possible structures for the nucleus of H^2 , which has been named the *deuteron* or *deuteron*. Thus, it may consist of two neutrons, regarded as primary uncharged particles of mass 1, and one positron. According to this hypothesis, the proton loses its supposed fundamental character as a constituent of atomic nuclei; it becomes an association of a neutron and a positron. A molecule of water is composed of two atoms of hydrogen and one of oxygen, H_2O . The hydrogen may be either hydrogen isotope of mass 1 or hydrogen isotope of mass 2. The two common isotopes of oxygen are isotope of mass 16 and isotope of mass 18. Ordinary pure water (light water) is made up of H^1 and O^{16} , $H^1H^{16}O^{16}$, while heavy water contains the heavier hydrogen isotope, H^2H^2O .

In 1932 Washburn and Urey examined the water from industrial electrolytic cells which had been operating two or three years. It was found that the optical spectrum of the hydrogen from this water showed an increase of the quantity of H^2 . Heavy water is prepared by the prolonged electrolysis of a 3 per cent solution of sodium hydroxide, nickel electrodes being employed. It is an advantage to start with a solution from an alkaline electrolytic bath which has been long in use, for such a solution has been found to contain larger amounts of heavy water. G. N. Lewis and R. T. Macdonald, of the University of California, started with 20 liters of water from an old electrolytic cell, which was half-normal in alkali, and electrolyzed it between nickel electrodes until the volume was reduced by 90 per cent. One-tenth of this was neutralized by carbon dioxide and the rest distilled. The two portions were then mixed, and the process was repeated until the volume had been reduced to half a cubic centimeter. The final result was water of specific gravity 1.073, estimated to contain 65.7 per cent of the hydrogen as H^2 . Subsequently, practically pure heavy water, H^2-O-H^2 was prepared by Lewis and Macdonald, and experiments on its physical properties were carried out with only 0.12 cc. of the liquid. During the summer of 1933 Hugh S. Taylor and Henry Eyring and their collaborators, of Princeton University, electrolyzed 600 gallons of water from old industrial cells, with the production of about 80 cc. of water containing upwards of 90 per cent of heavy hydrogen. It was found that about 1 cc. of water, 95 per cent heavy, was obtained for every 7 gallons of starting material. There is about one part of heavy water in 5000 parts of rain water. The Princeton laboratory is now (October) producing about 1 cc. of heavy water every two days. Urey says: "The cost of producing heavy water in these high concentrations comes to about 15 or 20 dollars per gram. This is in marked contrast to the quotations which we have seen in the public press of \$150 a gram." (See *Science*, Dec. 22, 1933, p. 568.)

According to E. B. Washburn, of the Bureau of Standards, the richest natural source of heavy water is native borax, a hydrated salt which exists in the beds of dead seas. The presence of a larger percentage of heavy water in stagnant seas is believed to be due to the more rapid evaporation of light water.

G. N. Lewis says: "The separation of any isotope in sufficient quantity to permit investiga-

tion not only of its spectrographic but also of its other chemical and physical properties suggests a wide range of interesting experiments but the isotope of hydrogen is, beyond all others, interesting to chemists. I believe it will be so different from ordinary hydrogen that it will be regarded almost as a new element."

As previously stated, Lewis and Macdonald prepared by electrolysis 0.12 cc. of H^2H^2O . Calculations showed that not more than 0.01 per cent of H^1 was present. Its freezing-point and boiling-point were as follows:

F.P., 3.8°C.

B.P., 101.42°C.

Like common water, there is a temperature of maximum density which for H^2H^2O is about 11.6°C.

P. W. Selwood and A. A. Frost, of Princeton, found the density (d_4) of water containing 92 per cent H^2H^2O to be 1.0970, and that of pure water to be 1.1052 ± 3 . Lewis has found the density of pure heavy water to be 1.1056.

The effect of heavy water upon seeds and animal organisms is being studied. Even before chemists had succeeded in concentrating the isotope of hydrogen, it was predicted that H^2H^2O would not support life. Lewis has demonstrated that the seeds of tobacco will not germinate in pure H^2H^2O , whereas seeds in ordinary distilled water sprouted within two days.

Taylor, W. W. Swingle (Biological Laboratory, Princeton), Eyring, and Frost summarize their results as follows:

(1) Water containing the isotope of hydrogen in high concentration (92 per cent) was found to be toxic for the animals tested.

(a) Tadpoles of the green frog *Rana clamitans* died within an hour after being placed in the water. Control animals in 30 per cent heavy water, and in ordinary distilled water, remained unaffected at the end of twenty-four hours. See also article on Zoölogy under *Amphibia*.

(b) The common aquarium fish *Lebistes reticulatus* is killed by the water within an interval of two hours. Neither 30 per cent heavy water nor distilled water exerted an effect over a twenty-four hour interval.

(c) Flatworms, *Planaria maculata*, are destroyed within three hours in the 92 per cent heavy water, but were uninjured by the 30 per cent heavy water over a period of three days.

(d) The protozoan, *Paramoecium caudatum*, is killed by the 92 per cent heavy water within 48 hours. Water containing 15-20 per cent of the heavy isotope of hydrogen did not affect the organisms during a three day interval. *Paramoecium* showed more resistance to the toxic action of the water than the highly organized animals studied.

What effect the drinking of heavy water will have upon animals and human beings has not yet been ascertained because of the limited quantities available. It is believed that it may induce a fever, and hence might be useful in treating diseases that require the raising of body temperatures.

Preliminary experiments made at Princeton University by Hugh S. Taylor, Earle R. Caley, and Henry Eyring have indicated that the solubility of salts in water containing a high concentration of H^2H^2O is markedly less than in ordinary distilled water at the same temperature. In the case of sodium chloride where 1.000 g. of ordinary water dissolves 0.395 g. at 25°,

it was found that 1.000 g. of water containing 92 per cent $\text{H}_2\text{H}^{2}\text{O}$ dissolves only 0.305 g. of this salt, a difference of -15.0 per cent.

Urey has suggested the name "protium" for the isotope of hydrogen having an atomic weight 1, and "deuterium" for that of atomic weight 2. Lord Rutherford of Nelson has urged the adoption of "diplogen" as the name for the double weight hydrogen, and "diploon" as the name of the nucleus or kernel of heavy hydrogen. The name "bar-hydrogen" also has been suggested for the heavy isotope of hydrogen.

OTHER DEVELOPMENTS: SCIENTIFIC SOCIETIES. After a careful study of the nutrition of rats, Prof. H. C. Sherman, of Columbia University, predicts that it will be possible to extend the life of human beings from 70 to 77 years. He says: "The quantitative studies of the energy relations, the protein chemistry of nutrition, the mineral elements, the vitamins, the interrelationships between the different nutritional factors, and the principle that in the chemical nutrition the ultimate concern is essentially nutritional reactions of the living body as a whole."

According to Sherman, milk is a fairly constant source of vitamins except vitamin D which prevents rickets. The human body is unable of itself to produce vitamins in the way that it produces hormones and enzymes. The rations supplied to cows contain vitamins A and B in fair amount, which find their way into milk. Vitamin C is also present in milk. The content of vitamin D can be increased by adding vitamin D concentrate to it, by irradiating the milk with ultra-violet light, or by giving irradiated food to the cows.

According to Dr. A. F. O. Germann, of Cleveland, carotene, the yellow coloring matter of carrots, butter, whole milk, etc., is much more valuable than nutritionists now believe, so its use in the diet should be increased. He believes that prehistoric man was able to resist many diseases that afflict civilized people because he ate plenty of this substance.

At a meeting of the Ohio-Michigan section of the American Chemical Society held at Akron, O., on October 13, Prof. Harry N. Holmes, of Oberlin College, described a pale yellow oil 9200 times more potent than ordinary cod liver oil. The oil is nearly pure vitamin A. Dr. Karrer, of the University of Zürich, has produced a similar oil 10,000 times as powerful as cod liver oil. Holmes prepares vitamin A from halibut liver oil.

Dr. T. Reichstein and his collaborators, of the Polytechnic Institute at Zürich, Switzerland, have announced the preparation of pure crystals of l-ascorbic acid, the anti-scorbutic substance which is believed to be identical with vitamin C.

At the Cancer Hospital in London research workers have isolated 1:2-benzpyrene, which is one substance to which tar owes its peculiar carcinogenic properties.

Dr. Roger J. Williams and C. M. Lyman, of Oregon State College, have concentrated a powerful growth-promoting substance which has been found in many plants and animals. They carried the concentration to a potency a thousand times stronger than any hitherto reached. Due to its widespread occurrence, the name "pantothenic" acid (Greek, meaning "from everywhere") has been suggested for the compound. All life may involve the presence of this potent substance.

At a seminar held on August 15 at Woods Hole, Mass., Dr. E. E. Chidester, of the University of West Virginia and the Marine Biological Laboratory at Woods Hole, gave further evidence of the vital part played by iodine in medicine. It is evident that all of the glands of the endocrine chain contain iodine at some stage. Numerous physiological studies suggest that iodine is involved in the activity of every cell of the animal body. It appears from Dr. Chidester's work that certain glands and substances containing iodine not only produce the sex hormone effect when injected into other animals, but are beneficial in the prevention and treatment of new growths by virtue of the iodine they contain. As stated by *Industrial and Engineering Chemistry*, "Doctor Chidester's own research has served to stress the importance of the thyroid disturbances characteristic of vitamin deficiency and to emphasize the iodine content of substances in vogue as sources of the sex hormone."

Prof. Arthur B. Lamb, of Harvard University, served as President of the American Chemical Society during the year. Charles L. Reese, of the duPont Company, Wilmington, Delaware, has been elected President of the Society for 1934.

The American Chemical Society met in Washington, D. C., from March 26-31. The total registration was 2293. An address was delivered by Dr. Irving Langmuir, Nobel Laureate in Chemistry, on the subject of "Surface Chemistry." At a general meeting the following notable papers were read: "Relation of Chemistry to the State." Harry L. Derby. "Relation of Chemistry to the Individual." C. F. Kettering. "Relation to Chemistry to Other Industry." C. M. A. Stine. "Chemistry—Its Interrelations with Other Sciences." Hugh S. Taylor. (See *Ind. and Chem. Eng.*, vol. 25, no. 5, pp. 481-497.)

The Eighty-sixth General Meeting of the American Chemical Society was held in Chicago from September 11-15. The total attendance was 3191, which was a record. Among the outstanding events were the award of the Willard Gibbs Medal to Prof. Richard Willstätter, of Germany, and the award in Pure Chemistry to Dr. F. H. Spedding, of the University of California. President Lamb, in the Hall of Science, at the Exposition, delivered his presidential address on the subject "A Century of Progress in Chemistry." Dr. W. F. G. Swann, Director of the Bartol Research Foundation of the Franklin Institute, reviewed the progress made in the past year in determining the nature of "Cosmic Rays." He reached the conclusion that the radiations consist of high-speed electrically charged particles and possibly bundles of very short wave-length light waves, known as photons.

Much attention was devoted to chemistry at the Century of Progress Exposition. The Century of Progress was able to secure a series of ten beautiful murals which show the growth and development of chemistry and its application to commerce, industry, and medicine. These murals were placed on the front of the Hall of Science. When the visitor entered the great hall of this building, attention was at once focused on an imposing model of the periodic table of the chemical elements. This exhibit was called the central feature of the entire exposition. It was about 30 feet high and 25 feet in diameter. The lower part consisted of a beautifully designed model of a periodic table of the elements, in which was displayed, in proper sequence, a specimen of each of

the elements. The most important source and the most important use of each element were also presented. The material for this exhibit was assembled from all over the world.

Dr. E. A. Pohle, professor of radiology, and Dr. Gordon Ritchie, assistant professor of pathology, of the University of Wisconsin, reported to the American Congress of Radiology which was held in Chicago in September, that thorium dioxide, a compound injected into the blood to make the liver and spleen radio-opaque so that X-ray pictures may be taken of them, produces such definite changes in the liver, spleen, and bone marrow that its use should be restricted to incurable cases. When a solution of thorium dioxide is injected into a vein, it does not leave the human system, but becomes deposited in a special type of cell which is present in the spleen, the liver, and the bone marrow, and it remains there. The result of the injections is injury to the organs similar to that sometimes found in acute infections. The opinion of these investigators was based on results obtained by two years of research on the effects of the compound on the body organs.

The British Association for the Advancement of Science met at Leicester from September 6-13. Color was one of the main topics discussed by the Chemistry Section. The presidential address was delivered by Prof. R. Robinson, F.R.S. It was entitled "Natural Colouring Matters and Their Analogues." Why are some flowers *blue* and others, containing the same pigments, *red*? Professor Robinson gave a summary of his anthocyan work. He has succeeded in establishing the nature of the colored *anthocyan*s in the various plants and in synthesizing most of them. It has been discovered that a particular anthocyan alone does not determine the color of the petal; there are also other factors concerned. The anthocyanins, like certain hydroxides, are amphoteric in nature. Thus, cyanin is red in acid and blue in alkaline solution. In consequence of this, R. Willstätter assumed that the sap of the red rose was acid and that of the blue cornflower alkaline, for both flowers contain cyanin. As a matter of fact all cell-saps are decidedly acid, and the explanation of the blue of the cornflower must apparently be sought in the colloidal state of the cyanin which is present in a complex form, giving a stable aggregate with a negative charge which may be further stabilized by the presence of polysaccharides in the cornflower. It now appears that all blue flowers owe their color to the presence of colloidal solutions of their respective pigments. In this connection it is of interest to note that in recent years many new coloring matters of the *carotene*-group have been discovered. The first products of synthesis in plants are dyestuffs with 40 carbon atoms, from which carotenoids, containing fewer carbon atoms, are produced by oxidative disintegration. The splitting of the carbon chains may occur in many different ways, giving rise to a variety of products such as the carotenes and vitamin A. α -, β -, and γ -carotene are provitamins A. Widely distributed in nature are certain water-soluble dyestuffs, colored yellow and fluorescing intense green. They have been named *flavines*. Ovoflavin from egg albumin and lactoflavin from milk have been prepared in crystalline form. The flavines can be reversibly reduced ($\text{flavine} + 2\text{H} \rightleftharpoons \text{leuco-flavine}$), and therefore act in the cell as transporters of oxygen.

Work on *hormones* is still progressing. Professor F. Kögl presented, at the meeting of the British Association, a paper on "Plant Growth Hormones (Auxin a and Auxin b)." A distinction must be made between division and elongation of plant cells. The purification of these plant hormones has been accomplished. Crystallized *auxin a* has been isolated for the first time from human urine and subsequently from vegetable material such as maize germ oil and malt. *Auxin a* has the formula $\text{C}_{10}\text{H}_{16}\text{O}_5$. Also, a second crystalline substance—*auxin b*—has been isolated from vegetable material. The formula $\text{C}_{10}\text{H}_{16}\text{O}_4$ has been assigned to it, and it is closely related to *auxin a*. Adults excrete independently of age or sex about 2 milligrams of *auxin a* daily.

Professor E. C. Dodds read a paper entitled "The Significance of Synthetic Oestrogenic Compounds." The following is a brief summary: Hitherto the oestrus reaction has been regarded as a specific response to oestrin and its derivatives, none of which has as yet been synthesized. It has been shown that compounds of widely differing chemical structure may be synthesized, capable of causing a full oestrus reaction. In addition, it has been shown that calciferol will produce oestrus when injected in large quantities, as also the two carcinogenic (Greek, meaning *cancer-producing*) hydrocarbons 1:2-benzpyrene and 5:6-cyclopenteno-1:2-benzanthracene. It would thus appear that it is possible to have one molecule possessing pharmacological activity of two entirely different varieties. The theoretical importance of these observations is great, since it may mean that the processes of oestrus-production, cancer production, and vitamin D actively are related in some unsuspected manner.

Professor L. Vegard read a paper entitled "The Auroral Spectrum and the Upper Atmosphere." Most of the results are based on spectrographic work carried out in Northern Norway. Apart from the strong green line and a couple of red lines, probably due to oxygen, the auroral spectrum is dominated by nitrogen bands. The type of nitrogen spectrum agrees well with the theory of Birkeland; namely, that the luminescence is produced by electric rays from the sun. The auroral spectrum gives no indication of an upper atmospheric layer dominated by hydrogen and helium.

One of the outstanding features in Section A was Lord Rutherford's review of 25 years' work on transmutation. He mentioned the remarkable properties of the neutron which is proving so effective in producing transformations of a novel type in certain elements: for example, oxygen can be transformed into carbon and lithium, and nitrogen into boron and helium. Lord Rutherford explained that particles of a different kind are now required for bombardment, and these are being produced by means of electrical discharge in a gas, as much as 5,000,000 volts being required to effect acceleration. Attention was called to the fact that Cockcroft and Walton at Cambridge are breaking up certain elements by means of artificially produced projectiles, much lower voltages being employed. Looking to the future 20 or 30 years, he said that voltages of millions of volts would probably be unnecessary as a means of accelerating bombarding particles. He thought that ultimately all elements would be transformed. Anyone, however, who is looking for a source of power in the transformation of the atoms is "talking moonshine."

On October 24 Prof. Harlow Shapley, of Harvard University, announced that Dr. D. H. Mengel, of Harvard, and J. C. Boyce, of the Massachusetts Institute of Technology, had discovered that the sun's corona consists, in part at least, of oxygen in a high state of excitation. The sun's corona has always been one of the great mysteries of the universe. According to the announcement of Professor Shapley, three of the strongest lines of the sun's corona are due to neutral oxygen atoms in the high solar atmosphere. Mengel and Boyce employed, in their analysis of the solar coronal spectrum, astronomical pictures taken at the time of the total eclipse of the sun in August, 1932. "The present analysis identifies three of the five strongest coronal lines with neutral oxygen atoms in the high solar atmosphere. These atoms are in peculiar states of excitation." In this connection it is interesting to note that in recent years the mysterious light of the aurora has been found to be due to ionized oxygen. Oxygen is "ionized" when one or more outer electrons are stripped from the oxygen atom.

Dr. Henry Eyring, of Princeton University, has applied *quantum mechanics* to several problems of chemistry. In his calculations he utilized the binding energies between atoms in solving problems of how rapidly chemical reactions occur. Among the notable achievements of Dr. Eyring was the study of the interaction of hydrogen with fluorine and other halogens. Contrary to what was frequently supposed, he showed that fluorine is really the least active of the halogens with hydrogen. Nearly all of the chemical literature stated the opposite; namely, that fluorine is much more active than the elements chlorine, bromine, and iodine. Dr. H. von Wartenburg of Germany at about the same time performed experiments which agreed with Dr. Eyring's calculations. He prepared pure hydrogen and pure fluorine and discovered that they would not react at room temperature. Dr. Eyring has also applied quantum mechanics to the problem of separating ordinary hydrogen from heavy hydrogen. (See *Proceedings of the National Academy of Sciences*, vol. lxxii, no. 4, 1933.)

AWARDS AND MEDALS. In recognition of Dr. Henry Eyring's notable contribution to quantum mechanics, the \$1000 Prize of the American Association for the Advancement of Science was awarded to him. The award was made at the Atlantic City meeting, at which Dr. Eyring read a paper entitled "Quantum Mechanics with Particular Reference to Reactions Involving Conjugate Double Bonds."

At the September meeting of the American Chemical Society held in Chicago, the Willard Gibbs Medal was presented to Dr. Richard Willstätter, of Munich, Germany. Dr. Willstätter is noted for his fundamental work in organic chemistry, particularly on cocaine, atropine, hemin, chlorophyll, anthocyanins, and enzymes. His latest field of study is that of enzymes, which has carried him into the very heart of life processes.

The Langmuir Medal, established by the American Chemical Society in 1931, was awarded to Dr. Frank H. Spedding of the University of California. This award recognizes "the accomplishment in North America of outstanding research in pure chemistry." It carries a prize of \$1000.

The Mendel Medal of Villanova College was awarded to Prof. Hugh S. Taylor, David B. Jones professor of chemistry at Princeton Uni-

versity. This honor is "conferred upon a Catholic who has given distinguished service in the advancement of Science." Professor Taylor was elected to a Fellowship of the Royal Society, in 1932, and was formally admitted in June, 1933.

The Schoellkopf Medal was awarded to Dr. Frank A. Hartman, professor of physiology at the University of Buffalo, for his work on cortin. This medal is bestowed annually by the Western New York Section of the American Chemical Society, for outstanding achievement in science.

The William H. Nichols Medal was awarded to Prof. Wilder D. Bancroft, of Cornell University, on March 10, for his work on the application of colloid chemistry to physiological problems.

The Herty Medal was presented to Dr. Fred Allison, of Auburn, Ala., on May 26, at the meeting of the Georgia Section of the American Chemical Society at Milledgeville. This medal was awarded in recognition of his work on magneto-optics. It is awarded annually for the most outstanding work done in the field of chemistry in the South.

BIBLIOGRAPHY. The following are the titles of some of the more important books published during the year: Daynes, *Gas Analysis by Means of Thermal Conductivity*; Kalechevsky and Stagner, *Chemical Refining of Petroleum* (Monograph No. 63, American Chemical Society); Laurens, *Physiological Effects of Radiant Energy* (Monograph No. 62, American Chemical Society); McAdams, *Heat Transmission*; Maxted, *Catalysis and its Industrial Applications*; Oppenheimer, *Chemische Grundlagen der Lebensvorgänge*; Rhodes, *The Phase Rule*; Tamman, *Die Glaszustand*; von Oettingen, *Therapeutic Agents of the Quinoline Group* (Monograph No. 64, American Chemical Society); Weeks, *Discovery of the Elements*; Weiser, *Colloidal Elements*; Wieland, *Mechanism of Oxidation*; Willard and Furman, *Elementary Quantitative Analysis*.

NECROLOGY. George P. Adamson, born in Philadelphia, Pa., on Aug. 24, 1864; died in New York City on February 16; director research department, General Chemical Co.; an authority on chemical reagents. E. H. S. Bailey, born Middlefield, Conn., on Sept. 17, 1848; died on June 1; professor emeritus of chemistry at the University of Kansas (Lawrence); chemist Kansas State Board of Agriculture and State Board of Health; an authority on water, and sewage; author of numerous books. Arthur M. Comey, born in Boston, Mass., on Nov. 10, 1861; died in Cambridge, Mass., on April 6; until his retirement he was prominently connected as chemist with E. I. duPont de Nemours and Co., Inc.; chairman sub-committee on Explosives, National Research Council, 1917; author of Dictionary of Chemical Solubilities. John M. Thomson, born in Old College of Glasgow on Mar 7, 1849; died on March 22; emeritus professor of chemistry at King's College, University of London; authority on composition of ancient glasses and of building materials; known for his work on putrefaction and antiseptics. Lyman Churchill Newell, born at Pawtucket, R. I., on Sept. 18, 1867, died at Brookline, Mass., on December 13; professor of chemistry at Boston University; author of numerous textbooks on chemistry; awarded the Justus von Leibig Medal by Giessen University (Germany) for his contributions to historical chemistry; dept. editor *Jour. of Chem. Edn.*

CHEMISTRY, INDUSTRIAL OR APPLIED. According to C. C. Concannon and A. H. Swift, of the Chemical Division, Bureau of Foreign and Domestic Commerce, Washington, D. C., as published in *Chem. and Met. Eng.* for September, the chemical industry as a whole has withstood the depression better than most others and the year 1932 ended in a relatively satisfactory condition. They say: "During the first quarter of 1933 the trend was downward, but since then it has been completely reversed. Employment in the chemical industries has improved and prices for many chemical products have advanced. Chemical foreign trade to-day is at a low level, but the United States has been holding its own in comparison with its five leading competitors. Viewed in summary, the year was one of corporate consolidations, reductions in the costs of operation and in the book values of properties, increased efficiency, through both technical and commercial research, expansion of present uses of products, development of new uses for old commodities and growth in the marketing of synthetic and other new materials."

There was considerable variation reported in the rate of productive activity within the chemical industry for September. Some branches made substantial gains over the preceding month, but some producers, due to the lessened demand for materials, failed to maintain the operating rate established in August. The index number for September was 130.4, identical with that reported for July. For August it was 131.2.

According to *The Chemical Age*, the past year in Canada was one of consolidation rather than new development. The outlook in the immediate future is a little uncertain. The discovery of rich radium-bearing deposits in the Great Bear Lake region, Canada, promises to open a new source of this element, thus breaking the Belgian monopoly. The United States is the world's largest consumer, producer, and importer of chemicals and allied products. It is second to Germany as an exporter.

During the last decade the chemists, engineers, and manufacturers of the United States have made such rapid progress in the development of coal-tar and other synthetic organic products, that it is now possible to supply almost all the chemicals consumed in American industry.

Higher priced chemical goods (paints and varnish, medicinal and toilet preparations, etc.) are produced largely in the North. There is considerable concentration of these industries in New York, New Jersey, and Pennsylvania. Four southern states (Alabama, Florida, Georgia, and South Carolina) produce nearly all of the rosin and turpentine; while Alabama, Florida, Georgia, North Carolina, South Carolina, and Virginia ordinarily produce about one-half of the commercial fertilizer manufactured in the United States.

HYDROCARBON OILS. Striking advances have been made by chemical engineers in the petroleum industry during the depression years. Thus, in the oil fields certain corrosion problems have been solved, and new methods have been developed for increasing the recovery of oil from the earth. This is in line with the conservation of natural resources. Chemical Engineering has also advanced in refineries. There have been improvements "in cracking and other distillation practices, in recovery of by-products, in developing and applying radically new refining processes such as hydrogenation, in utilizing new agents

and methods in chemical treatment." In 1932 Standard Oil of Indiana built a cracking unit capable of completely processing 19,000 barrels of charging stock per day. This is the largest cracking unit in the world. *Vacuum distillation* is increasing. Vapor-phase cracking, employed for producing high anti-knock gasoline, also has made rapid progress. *Hydrogenation* of petroleum has achieved remarkable results. In 1930, a 5000-barrel per day unit commenced operations at Bayway, N. J., to be followed a year later by a similar plant at Baton Rouge, La. The first product to be marketed was a hydro-refined lubricating oil, "Essolube." Liquefied petroleum hydrocarbons are now extensively utilized. This is a very convenient fuel.

At the September meeting of the American Chemical Society Dr. Gustav Egloff, of the Universal Oil Products Company, read a paper entitled "Economics of Petroleum." He told how chemistry, by the "cracking" process, has developed an industrial process which has produced a 300 per cent increase in the yield of refined gasoline of higher quality, and he also showed that it is an important factor in the gas and coal industries, and in other industries. In 1932, 43 per cent of the gasoline marketed was produced by the cracking process. This type of motor fuel is generally recognized to have improved properties and anti-knock value. This process means the conservation of 500,000,000 barrels of crude oil annually and savings of over \$100,000,000 a year to motorists. The cracking process produces 250 billion cubic feet of high heating value gases annually, which means that the supremacy of coal is being challenged by fuel gas. Since 1913 the coal industry has declined 35 per cent, while the fuel oil industry has increased 150 per cent. On July 17, Prime Minister MacDonald made a very important statement in the House of Commons concerning the production of petrol, or motor fuel, from coal: in order to stimulate the domestic production of motor spirit, he stated that the government proposed to guarantee for 10 years a preference at the rate of four pence per gallon in respect of light hydrocarbon oils manufactured in Great Britain from indigenous coal, shale, or peat, or from products derived from these materials. The plant in mind would have a capacity of 30,000,000 gallons annually, which would require 350,000 tons of coal. Seven thousand men would be directly employed. The production of petrol in such a plant would be about 1/40th the amount needed in Great Britain. According to the October number of *Chemical and Metallurgical Engineering*, the I. G. Farbenindustrie, of Germany, has made so much improvement in *hydrogenation*, due to newly discovered catalysts, that it is possible to increase the capacity of the hydrogenation plant at Louna 200-300 per cent. "As a last and most important achievement resulting from the experiences with new catalysts in the 'sump' phase (liquid phase) I. G. has now developed the successful hydrogenation of lignite on a commercial scale. Lubricating oils, equally as good as the Russian types, may also be produced from lignite by this procedure. About 3,500,000 tons of coal—that is, about 2.5 per cent of the German output, are necessary to produce the hydrogen and the power required in the manufacture of 1,000,000 tons of gasoline from coal tar."

At the May meeting of the American Petroleum

Institute held in Tulsa, Oklahoma, Dr. P. D. Trask and his collaborators of the U. S. Geological Survey presented a theory to account for the origin of petroleum. According to their theory, dead bodies of myriads of sea plants are attacked by bacteria which appropriate materials required for their needs, and the residue gradually yields petroleum. With great increase in sedimentary thickness, pressure and heat are produced, which "squeeze and fry out the material which eventually becomes petroleum." The oil seeps through sandy strata and collects in pools.

FERTILIZERS. America is becoming less dependent upon foreign countries for *potash*, particularly since the exploitation of the important deposits in New Mexico. According to the Bureau of Mines, the potash produced in the United States in 1932 amounted to 143,120 short tons of potassium salts, equivalent to 61,990 tons of pure potash (K_2O). The amount imported (K_2O) was 113,505 tons. The principal sources of potash salts were from the salines at Trona, Calif.; molasses distillery waste at Baltimore, Md., and the potash mines and refinery at Carlsbad, N. M. The dust from cement near Hagerstown, Md., was another source of potash. The production of pure potassium chloride from the Carlsbad sylvanite is one of the most significant industrial developments in the United States since 1929. It has been demonstrated that the Permian basin of Texas and New Mexico holds sufficient potash of high grade to meet all American needs for centuries. C. A. Ward says: "With reasonable freight rates, there is no apparent reason why this new industry should not be able to compete successfully with its older foreign competitors and make the United States permanently independent as regards its potash supply." Before the World War the United States imported about 99 per cent of its potash from Europe.

Phosphoric acid can now be produced by a blast-furnace method. Under the direction of H. W. Easterwood, chemical engineer, there has been erected at Nashville, Tenn., a large blast-furnace with the capacity to produce 250,000 pounds of phosphoric anhydride (P_2O_5) daily. Briquettes of phosphate rock, silica sand, and coke are burned in a large furnace. The anhydride is converted into phosphoric acid by the addition of water. It is shipped in rubber-lined cars, and is utilized in the production of phosphates for fertilizers, drugs, etc.

Ammoniated peat, a product obtained by heating ammonia and peat under pressure, gives promise of being a valuable fertilizer. This new material has been developed in the laboratories of the U. S. Department of Agriculture. It appears to combine many of the good features of the two familiar types of nitrogen-carrying fertilizers. While raw peat is of relatively little value as a nutritive ingredient in fertilizer, it is a highly desirable material in mixed fertilizers because of its value as a conditioner, preventing the caking of the product, and because it supplies to the soil a desirable form of organic matter.

RUBBER. At the meeting of the American Chemical Society held in Chicago in September, Dr. W. H. Carothers, research chemist employed by the duPont Company, reported the production of the first synthetic materials which have elasticity and strength equal to those of natural rubber. Like rubber, these new materials crystallize when stretched, and return to their original amorphous condition when allowed to contract.

Chloroprene and bromoprene, produced from vinyl acetate, appear to be superior to other substances which have been used to produce the rubber-like materials.

Musk. At the Washington meeting of the American Chemical Society synthetic musk was announced which practically reproduces the costly material imported from Asia. This fragrant material is found in the abdominal glands of male musk deer of the highlands of Tibet. The dried musk pods are shipped in metal-lined boxes. Since only 2 per cent of this musk is the active odorous principle, its cost, based on current prices, is about \$16,000 per pound. Due to patient research, the chemist has learned how to synthesize musk-like substances from vegetable oils and other materials. These "large ring" compounds possess characteristic odors, some of which are virtually identical with the musk obtained from the deer. It is likely that the synthetic musks will be produced commercially and that they will meet the requirements of the perfumery trade.

PLASTICS. The plastic industry continues to change and grow. H. V. Potter defines the term, plastic, as follows: "The technical plastics covered by what is now known as the 'Plastic Industry' may be described as materials which take shape or form by the application of heat with or without pressure and retain that form on cooling." Some important plastics are as follows: natural resin plastics, bituminous plastics, celluloid plastics, synthetic resin plastics, and cellulose plastics. Only a few of the new plastics are more than 10 or 15 years old. They have proved to be strong, convenient, and beautiful. Lovely color effects can be obtained. An interesting plastic which has come on the market recently is called "benzyl cellulose," a product made from natural cellulose. This material can be produced in flexible form, more flexible than celluloid. The *British Plastics Year Book* for 1933 has devoted 80 pages to proprietary and general names of synthetic resins.

RAYON. The world is consuming enormous quantities of rayon, or the so-called artificial silk. On July 1 the American rayon mills had the capacity to produce over 233,000,000 lbs. annually by the following processes: viscose rayon, 180,700,000 lbs.; acetate rayon, 35,500,000 lbs.; cuprammonium rayon, 8,900,000 lbs.; nitrocellulose rayon, 8,300,000 lbs. The United States produced 150,000,000 lbs. of rayon in 1932, 80,000,000 lbs. of which were used in dress fabrics and other woven materials. It is reported that the production of rayon in Japan rose during the first six months of the year from 12,000,000 to 18,000,000 kg. This increase makes Japan the second largest producer in the world, taking the place of Great Britain.

FOOD. The Report of the Food Investigation Board (of England) for the year 1932 was published late in the summer of 1933. This report contains about 300 pages of particularly interesting material. The Food Investigation Board is a branch of the Department of Scientific and Industrial Research, and its director is Sir William B. Hardy, F.R.S. The work was concerned with various problems, such as the effect of low temperature upon food. As the result of certain experiments having to do with the rapid and slow freezing of meats, it was found that the most fastidious experts could detect no difference between meat preserved by these two methods. The report contains an interesting chapter on apples,

Many fruits, including the apple, take up oxygen from the air and produce carbon dioxide long after they are gathered. It appears that carbon dioxide is not the only gas or vapor given off by apples. It has been discovered that a few ripe apples placed among potatoes prevent their sprouting as they usually do, possibly due to the evolution of ethylene in slight amount. While the vapor given off by apples delays the normal sprouting of potatoes and peas, it hastens the ripening of tomatoes and bananas. The vapor of ripe bananas induces the ripening of green bananas. It is said that ethylene, propylene, and acetylene are the only gases known which have this effect upon tomatoes and bananas; it is therefore suspected that ethylene is responsible for the effect of apples upon potatoes and peas.

According to Dr. F. Bergius, the German inventor of the process for the hydrogenation of tar and coal, notable progress has recently been made in the *production of food by chemical means*. Sugar, for example, can now be produced from wood on a commercial basis. Dr. Bergius says that in countries where wood is obtainable in large quantities, wood sugar can be produced at lower cost than cane sugar is produced in the torrid zone. Not only is wood sugar a cattle food but a source for the production of yeast and of sucrose for human consumption. Dr. Bergius says: "For the over-populated and industrialized European countries wood may become an important factor towards independence of food supply from abroad in the same way that the coal hydrogenation process will ensure independence of a foreign oil supply."

SOAPLESS DETERGENTS. An American corporation has been licensed by German concerns to manufacture a new type of soapless detergents (Gardinols). This group of compounds contains a variety of double sulphates of sodium and fatty alcohols. All these sodium alkyl sulphates are produced from various soap oils. "By hydrogenation under high pressure and temperature with a copper catalyst, the fatty acid molecule is reduced to the corresponding alcohol form, a departure from the usual hydrogenation procedure in fat hardening and the like in which additional hydrogen atoms become attached to the unsaturated molecules." These fatty alcohols are allowed to interact with sulphuric acid and soda. It is claimed that the soapless detergents have very active emulsifying and cleansing action, and lather quite freely in hard water. The Gardinols possess unusual penetrating power with resulting high wetting-out of textiles. One American firm is offering "Drift," the packaged form of Gardinol, to be sold for use like soap chips.

WEED DESTRUCTION. Experiments are being conducted in England with a view to the large-scale destruction of weeds by means of chemicals. Dilute sulphuric acid which contains from 7 to 10 per cent of H_2SO_4 is used. Normally about 100 gallons per acre are required on grain-fields. This strength of acid kills the charlock, a very common weed. The outer skin of the weed is thin and is readily permeated by the acid, while that of the cereal is thick. In France several thousand acres are sprayed with sulphuric acid annually, as much as 27,000 tons of acid having been used in 1931.

For spraying English gardens, a 10 per cent solution of sodium chlorate and calcium chlorate is employed. About a gallon of the solution is

applied to 12 square yards. It is quite deadly to weeds and grass.

SULPHUR MINING. One of the important chemical achievements of the year is the successful *mining of sulphur under water*. The Frasch process for mining sulphur has been employed very successfully for a number of years. Due to the labors of Lawrence O'Donnel, chemical engineer, and his associates, the Frasch process is now being applied to the mining of vast deposits of sulphur under lakes and swamps in Louisiana. According to *Science Service*, the mining is carried out by sinking a shaft 700 feet below the bottom of a lake where a stratum of sulphur 200 feet thick lies. Pipes leading to the plant on the shore are sunk and the sulphur, liquefied by superheated water, is forced out by means of compressed air. To date (October, 1933) 200,000 tons of sulphur 99.92 per cent purity have been taken from the wells. The yields of sulphur have far exceeded expectations. One plant has reached a production of 1400 tons per day and regularly produces 1200.

ELECTRICAL PRECIPITATION. The electrostatic method of separating solid or liquid particles from gases is now extensively employed in industry. As is well known, it is applied in the manufacture of sulphuric acid, both for the removal of dusts from hot burner gases and the elimination of mists in the contact process. It also is employed in connection with the roasting and smelting of ores, such as those of copper, lead, tin, and arsenic. A large field is now developing in the separation of dust particles from combustion gases, especially power stations which use pulverized fuel. This is an immense undertaking for power stations, because huge volumes of gas are involved, averaging 500,000-600,000 cu. ft. of gases at, say, 275-300° F. (135-150° C.) per ton of burnt coal.

METALS AND ALLOYS. At a meeting of the Electrochemical Society held in Chicago on September 7, Prof. O. P. Watts, of the University of Wisconsin, expressed the opinion that hydrogen is the sole defender against the *corrosion* of metals, which costs enormous sums annually. Many years ago Dr. R. W. Whitney, of the General Electric Company, propounded the electrochemical theory of corrosion, which has been pretty generally accepted. When a metal comes in contact with an acid, hydrogen is displaced from the latter and it forms a layer on the metal, which tends to prevent corrosion. Under ordinary conditions, however, oxygen combines with the hydrogen, thus exposing once more the surface of the metal, followed by further corrosion. The extent of the corrosion depends on the supply of oxygen. According to Watts, if oxygen is excluded, copper will not corrode in a solution of sulphuric acid, a reaction which occurs readily in the open. *Corrosion research on light metals* is being carried on. The elements which may be classed as light metals are aluminium, magnesium, beryllium, and lithium. Silicon, also, has some metallic properties, but it is really a non-metal. Owing to the fact that aluminium is used so extensively in industry, particularly in aircraft, it is very important to study its corrosion. More recently *magnesium* has come to be considered of likely importance for structural work. Much attention, it is reported, is being given in Germany to the possibility of using *lithium* in light alloys. Silicon alloys are important, and useful applications of beryllium will no doubt be found. Fortunately

the rate of corrosion of the light metals is small compared with that of the ferrous metals. From the study of the problem of corrosion two facts stand out in a sea of conflicting theories, namely, "that corrosion of metals is essentially an electrolytic phenomenon, and that whatever resistance to corrosion is exhibited by any metal is due to the presence of a microscopically, or even sub-microscopically, thin film of oxide which forms on exposure to air or other gas containing measurable quantities of oxygen." It should follow from this that a chemically pure metal of uniform physical condition when totally immersed in a chemically pure simple solution will not corrode, and there seems to be increasing evidence to show that this is really the case.

At the meeting of the Electrochemical Society in Montreal, Dr. Colin G. Fink and C. Y. Wong, of Columbia University, reported a *new electroplating solution* for copper plating steel to take the place of the poisonous cyanide bath. The solution contains the complex substance disodium diquodioxalatocuprate ("oxalato" bath). A satisfactory coating of copper can be obtained in one minute with a low electrical current density.

The large-scale production of *thallium* compounds from zinc blende as a by-product of lead and zinc manufacture has been recently undertaken in Belgium. A surprising number of uses and potential applications of thallium have developed; therefore the large-scale production will make it more readily available for industrial uses. In 1928 the price of thallium sulphate was quoted at \$15 per lb. and at \$7.50 per lb. in 1932. It is probable that in large quantities the price will be much lower. According to the *Journal of the Society of Chemical Industry*, the industrial uses of thallium and its compounds which appear to be most promising are in the manufacture of certain special alloys, as a rat poison, an insecticide, for medical purposes, in the production of photoelectric cells, for treating fabrics, etc., to render them water and insect proof, and in the preparation of anti-knock motor fuel.

Indium (element 49) was discovered in 1863 by the German chemists Reich and Richter. According to W. S. Murray of Utica, N. Y., a consistent mineral deposit bearing indium has been found, and a commercial process for its production has been developed. The process involves flotation, concentration, roasting of the concentrate, dissolving the soluble portion of the roasted concentrate in sulphuric acid, followed by precipitation of the metal. Indium can be precipitated by metallic displacement, or it can be plated out. The element is now ready for commerce. "Indium plate as it comes from the bath is soft, uniform, and gray. It can be diffused into the base metal and thereby hardened. This procedure both hardens and stabilizes the surface so treated; that is, the surface is very resistant to oxidation and tarnish. Little has been done with indium outside the field of plating and alloying."

In a paper read before the Institute of Metals (England) on March 8, W. Singleton and Brinley Jones gave their results of an investigation of the effect of the addition of small amounts of other elements to *lead* and *lead alloys*. It has been discovered that the addition of a small amount of tellurium (about 0.06 per cent) to lead increases its resistance to corrosion and also increases its toughness and tensile strength. The lead-tellurium alloy is more resistant to the ac-

tion of boiling concentrated sulphuric acid than is pure lead. It is also of interest to note that selenium compounds have been found to have a great influence to protect magnesium from corrosion. It appears that tellurium reduces the corrosion of lead to about one-seventh of what it is in the case of pure lead.

The growth of the *alloy part of the steel industry* has been marked. In 1902 only 2 per cent of the total steel ingots and castings were alloy, but it has climbed steadily until it is now 6 per cent. The corrosion, rust, and heat resisting steels are very important. For example, the use of stainless steel in nitric acid plants; in the paper industry high chromium-nickel castings are employed for handling sulphite liquors; in the reaction chambers of the chemical industry high-nickel alloys find employment. E. E. Thum says: "The most spectacular advances are being made in the high chromium-nickel alloys, which have proven so enduring against hot gases that all manner of furnace parts are being made of them (even for high temperatures in the ceramic industries) such as containers, muffles, heat exchangers, conveying mechanisms, resistors, and burner parts. The enthusiast pictures the ovens, kilns, and furnaces of the future as made of a little brick, but mostly of metal and insulation materials." *Theatre proscenium curtains* made wholly of steel or of two-ply asbestos cloth with steel frames will provide the maximum protection to audiences, an investigation recently conducted by the Bureau of Standards revealed. Steel curtains, it was found, would insure safety for a half-hour, while steel-framed asbestos curtains could be depended on for about half that time. Since most auditoriums are designed so that the audience can make its exit within 5 minutes, either of these types of theatre curtains should offer a sufficient margin of safety.

The Institute of Metals held its Silver Jubilee Autumn Meeting in Birmingham, Eng., from September 18-21, under the presidency of Sir Henry Fowler. The arrangements included a lecture on "Twenty-Five Years' Progress in Metallurgical Plant," by W. R. Barclay, Vice-president, and a series of 14 papers dealing with various phases of metallurgical work.

A POWERFUL SOLVENT. Professor O. F. Stafford, of the University of Oregon, has discovered that *acetamide*, a compound produced cheaply from acetic acid and ammonia, has a wider range of solvent action than any other known substance. Acetamide is a white, crystalline solid which melts at 80° C. to form a mobile liquid. Hitherto water and ammonia have been regarded as the best solvents, but acetamide is said to be superior to both. According to *Science Service*, "its ability to dissolve many things, at present nearly or quite insoluble, is expected to lead to important industrial applications."

SOCIETY OF CHEMICAL INDUSTRY. The fifty-second Annual Meeting of the Society of Chemical Industry was held at Newcastle-on-Tyne from July 10-14. The proceedings were conducted by Dr. R. H. Pickard, F.R.S., the president of the Society. The Society's Medal was presented to Prof. W. A. Bone, head of the Department of Chemical Technology at the Imperial College of Science and Technology, London. The award was made in recognition of his work on the subject of combustion. Professor Bone delivered an address entitled "Forty Years of Combustion Research." The address gives a clear account of the

essential principles of a vast amount of work done during the last half century. While his research on combustion has dealt with a variety of problems, Professor Bone discussed only two at length. The first is concerned with the propagation of flames and explosions and the determination to the speed of propagation; also with the photographic recording of the flame, a difficult feat, for the front of the flame is rotating some thousands of times per second. The second problem deals with the preferential treatment displayed by oxygen when exploded by hydrocarbons. It is most interesting that oxygen prefers a hydrocarbon to hydrogen or carbon monoxide, but the reason for this is not entirely clear.

At the 64th meeting of the American Electrochemical Society held in Chicago in September, Prof. R. S. Hutton delivered an address to commemorate the hundredth anniversary of Faraday's discovery of his two fundamental laws of electrolysis. A session on corrosion was also held.

The annual meeting of the Chemical Society of France which was held in Paris from June 15-17, was made the occasion of a French commemoration of the birth of Priestley, who was a French citizen by decree of the National Assembly at the time of the Revolution. Sir William Pope presided at the opening meeting held at the Pasteur Institute when C. Matignon, professor of chemistry at the Collège de France, delivered a comprehensive presidential address on Priestley.

A meeting was held in London on April 6 to commemorate the life and work of Joseph Priestley who was born near Leeds, on Mar. 13, 1733 (O.S.). He left 12 books and some 50 papers dealing with physics, chemistry, and physiology. His most important discovery was oxygen, which was made on Aug. 1, 1774.

Carbon dioxide has become a very important refrigerant. Solid carbon dioxide was discovered by Thilorier 98 years ago, but was not produced commercially until 1924. The output of "dry ice" has increased enormously in the United States. In 1925 only 170 tons were produced, but in 1930 the output was 70,000 tons, and in 1932 about 61,000 tons.

Several industries have been established in Palestine, such as cement works, bricks, and tiles for building. The extraction of chemicals from the Dead Sea has been most successful. Regular shipments of potash to the United States has been planned, and it is anticipated that in 1933 the annual production will be about 10,000 tons. Leather, shoe-polish, scouring powders, tooth paste, shaving soap, aluminium ware, etc., are also produced in Palestine.

Industrial and Engineering Chemistry (Oct. 10) gave an account of plans for the scientific organization of the Ninth International Congress of Pure and Applied Chemistry at a gathering of chemists of Spain and other countries held at the summer University of Santander, August 8-18. The committee set Apr. 5-11, 1934, as the date for the congress. The year 1934 will be especially advantageous for American chemists to visit Europe, for in addition to the International Congress at Madrid, the Third International Congress of Agricultural Industries will be held in Paris the preceding week. This congress will be devoted particularly to such industries as sugars, fermentation and distillation, fertilizers, foods, and tropical products.

At the September meeting of the American

Chemical Society in Chicago, Miss Cornelia Burwell, a young research worker of Ann Arbor, Michigan, reported a promising remedy for such skin diseases as ringworm, eczema, and acne. It consists of complex organic compounds produced in the laboratory, as salts of certain fatty acids obtained from petroleum. The application of the remedy tends to restore the normal condition of the skin.

Trypan blue, an aniline dye product, is now being used in the treatment of leprosy, and remarkable results are claimed for it. Treatment consists of six injections of the dye. A few minutes after the injection the body turns entirely blue, but this disappears in about six weeks, and the leprosy is said to be completely cured. It is hoped that trypan blue may be used as a remedy for tuberculosis.

On Oct. 16, 1846, William Morton, a young Boston dentist, successfully demonstrated that surgical operations could be performed under ether. The eighty-seventh anniversary of this important discovery was celebrated at the Harvard Dental School. The room in which the first operation took place is still preserved in the old main building of the Massachusetts General Hospital.

An extensive investigation has been carried out at Savannah, Georgia, under the direction of Dr. C. H. Herty, to determine the possibilities of producing newsprint and other grades of white paper from young southern pines. The preliminary tests were quite promising.

The Perkin Medal was awarded to George Oenlager, research chemist of the B. G. Goodrich Company, Akron, O. The Perkin Medal may be awarded annually by the American Section of the Society of Chemical Industry for the most valuable work in applied chemistry.

The Chandler Medal was awarded to Dr. George O. Crume, Jr., research director of the Carbide and Carbon Chemicals Corporation, New York, in recognition of his synthesis and large-scale production of many aliphatic chemical compounds.

CHESS. Not called upon to defend his world's championship crown, wrested from Jose Capablanca in 1927, Dr. Alexander Alekhine, of Paris, continued his exhibition chess tours in 1933 and established one new record. At the Century of Progress Exposition in Chicago in the summer, Alekhine set a new standard for blindfold play by conducting thirty-two games simultaneously against that number of opponents without sight of board or men. This mental feat was performed in twelve hours at the end of which the champion had nineteen victories, four losses and nine drawn games.

The chess year was notable for the fine showing of the United States players in international competition. In the biennial international team tournament of the International Chess Federation held at Folkestone, England in July, in a field of 15 countries, the United States team emerged victorious, after a close battle with the representatives of Czechoslovakia. The American team thus retained possession of the Hamilton-Russell Trophy, first won by the United States forces in 1931 at Prague. For the most part the successful team was made up of youngsters who had learned the game in New York City. Frank J. Marshall, United States champion since 1909, and captain of the team, was the lone veteran player. The other players were Isaac Kashdan, Reuben Fine,

Arthur W. Dake, and Albert C. Simonson. Sweden, Poland, and Hungary tied for third place at Folkestone; Austria was sixth, Lithuania seventh, France eighth, Latvia ninth, and Great Britain tenth.

Honors in the championship meetings of the Western Chess Association and the New York State Chess Association fell to two New York City players, Reuben Fine winning at Detroit and Fred Reinfeld at Syracuse. Fine won the Marshall Chess Club championship and Abraham Kupchik that of the Manhattan Chess Club.

Lieutenant John D. Matheson of West Point topped a field of twelve to win the intercollegiate tournament at the Chicago Fair with Nathan Beckhardt of City College of New York second and Willis E. Lamb, Jr. of the University of California, third. City College won the Intercollegiate Chess League honors in New York and Harvard took the title in the H.Y.P.D. College Chess League. Martin C. Stark of Harvard won the individual college championship in the New York tournament.

CHICAGO. See ILLINOIS under *Political and Other Events*; MUSIC; ART EXHIBITIONS.

CHICAGO, THE UNIVERSITY OF. An institution of higher education and research in Chicago, Ill., founded in 1890. The university is privately endowed, coeducational, and non-sectarian, although one-third of its 30 trustees must be Baptists. John D. Rockefeller founded the university, and his personal gifts amounted to a total of \$35,000,000 over a period of 20 years.

The educational reorganization of the university (see the NEW INTERNATIONAL YEAR BOOKS for 1930, 1931, and 1932, for details) entered its third year of operation at the opening of the autumn quarter, 1933. As in the first year of the "New Plan," various improvements as to details were made but the essential basis of the educational programme was unchanged. President Hutchins stated the aim of the college in these terms: "Our college is devoted to understanding collegiate education. We think of course that in the process of trying to understand college education we are administering the best in the world. We think our college students are profiting greatly by such things as the New Plan, which is one of the first fruits of our efforts to discover what a college education ought to be." At the opening of the autumn quarter, another step in President Hutchins' programme of defining the functions and organization of education was taken with the consolidation of the last two years of University High School with the first two years of the college.

President Hutchins initiated also discussions with Northwestern University as to the desirability of some form of coöperation between the two institutions. This consideration centred around the possibility of a merger. If such a merger proves, after careful investigation, to be educationally desirable and possible of accomplishment, President Hutchins believes the consolidation would be of great value to higher education in the United States, as a notable step in the elimination of duplications and overlapping and in offering an opportunity for the clarification of educational organization.

During the year, Gilbert A. Bliss, professor and chairman of the department of mathematics, was appointed Martin A. Ryerson Distinguished Service Professor; Edgar J. Goodspeed, chairman of the department of New Testament and early

Christian literature, was appointed Ernest DeWitt Burton Distinguished Service Professor; Frank R. Lillie, dean of the division of the biological sciences, was appointed to an Andrew McLeish Distinguished Service Professorship; William F. Ogburn, professor of sociology, was appointed Sewell L. Avery Distinguished Service Professor; Harry A. Bigelow, dean of the law school, was appointed John P. Wilson professor of law.

In the summer quarter, 1933, the enrollment was 4952 students, of whom 2108 were men and 2844 were women. In the college and divisions in arts, literature, and sciences there were 1171 men and 1146 women in the graduate classification; 227 men and 384 women undergraduates, and 95 men and 269 women unclassified. In the professional schools there were 665 men and 490 women; in University College (downtown division), 84 men and 600 women. In the autumn quarter, 1933, the total enrollment was 7891, a gain of 8 per cent over the same quarter of 1932. Of the total, 4402 were men and 3489 were women. In the college and divisions there were 2382 men and 1471 women; in the professional schools, 1092 men and 488 women; and in University College, 919 men and 1529 women. Of the total enrollment in the divisions of arts, literature, and sciences and in the professional schools, 1675 men and 744 women were classified as graduate students; 1782 men and 1176 women were undergraduates; and 21 men and 51 women were special students. (Small discrepancies in totals are due to duplications.) The Home Study, or correspondence department, had an average of 5100 students.

On Dec. 15, 1933, the members of the faculty, exclusive of assistants and teachers in the laboratory schools, was 852, including 102 in University College. In all departments and in all grades of service the university employed approximately 3000 persons. The assets held by the university as of June 30, 1933, were \$111,131,191, divided as follows: Endowment, \$60,242,064; plant, \$40,831,672; other assets, \$10,057,454. The total income under the university's combined budget for the fiscal year 1932-33 was \$7,335,529, while expenditures amounted to \$7,324,958. Students' fees provided 30.60 per cent of the university budget income, and endowment funds 34.52 per cent. The salary cost of instruction and research constituted 36.91 per cent of the budget expenditures, or \$2,703,587. The total amount of gifts paid in was \$4,865,745.

The University of Chicago Press published 122 books during 1933, in addition to 16 scholarly journals and a considerable number of publications for such groups as the National Advisory Council on Radio in Education. The most important publications were *The University of Chicago Survey*, in 12 volumes; *The Short Bible*, edited by Edgar Johnson Goodspeed and J. M. P. Smith; *What Plato Said*, by Paul Shorey. The Press distributed also the educational talking pictures, production of which was undertaken in 1932 in coöperation with Erpi Picture Consultants, Inc. Six films of a series of 20 in the physical sciences have been completed. Accessions to the university libraries increased the number of bound volumes to 1,048,001. The number of periodicals received totaled 5322. President, Robert Maynard Hutchins, LL.D.

"CHICAGO PLAN." See UNIVERSITIES AND COLLEGES.

CHIERA, EDWARD. An American educator and Orientalist, died in Chicago, Ill., June 21, 1933. Born in Rome, Italy, Aug. 5, 1886, he came to the United States in early manhood, attending the Crozer Theological Seminary at Chester, Pa., and the University of Pennsylvania, receiving from the latter the Ph.D. degree in 1913. Until 1927 he served on the faculty of the University of Pennsylvania, first as an instructor in Assyriology (1913-19) and then as an instructor in Semitics (1919-22), assistant professor of Assyriology (1922-26), and professor of Assyriology (1926-27). At the time of his death he held the chair of Assyriology at the University of Chicago and was editor of the *Assyrian Dictionary*, under compilation by that institution since 1921.

Becoming associated with the American School of Oriental Research in Bagdad in 1924, Dr. Chiera directed excavations at Nuzi, Iraq, during the next four years and in 1928 uncovered near Kharsabad ruins of the ancient Assyrian civilization from the stone to the bronze ages. His publications included: *Legal and Administrative Documents from Nippur* (1919); *Lists of Personal Names from the Temple School of Nippur* (3 parts, 1916-19); *Catalogue of the Babylonian Cuneiform Tablets in the Princeton University Library* (1921); *Selected Temple Accounts from Telloh, Yokla, and Drehem* (1922); *Old Babylonian Contracts* (1922); *Sumerian Religious Texts* (1924); *Adoption Documents* (1927); *Sumerian Lexical Texts* (1930); and *Exchange and Security Documents* (1931). He was also cooperative editor of the *American Journal of Semitic Languages*, and in 1918 was made a chevalier of the Order of the Crown of Italy.

CHILD LABOR. Early in the year it became increasingly evident that all the forces for social welfare were being mobilized in an effort to eradicate the evil of child labor in industry. The deepening of the depression, while it had its effects on child workers, had presented this peculiar irony: because they were prepared to work for smaller wages in the labor market wherever possible, they were being utilized as replacements for higher paid adult workers. The progress of the depression indicated that there were upwards of two million boys and girls still being employed while at least seven times as many adults had been rendered jobless; child exploitation had once again raised its head particularly in the textile and clothing trades; and that increasingly there were appearing evidences of violations of child labor laws and factory codes as affecting young workers. Organizations watchful for the welfare of children in industry pointed out that because there were absent suitable openings for young workers, these were accepting ill paid and blind alley jobs; that there was an increase of children in those occupations which were not coming under the purview of child labor laws, such as tenement home work and street trades; that the problem of idleness among children who had dropped out of school and could not find work was serious; and that the sharp reduction in educational services as a result of the practically bankrupt condition of many local jurisdictions was a sign of the times which could scarcely augur well for the future. All these aspects of the situation were nothing less than tragic and it seemed as though the slow progress that had been attained as a result of the concentrated efforts of welfare workers of a gen-

eration was being dissipated practically over night. It was, therefore, heartening to observe the rallying of forces from so many different quarters for the rescuing of the children of the nation during the year 1933.

A continuing committee, appointed by the Children's Bureau Conference on Present-Day Child Labor Problems, clarified the legislative programme of the conference to sharpen up its objectives. The most important of these was the following: The establishment of a basic 16-year minimum for all gainful employment, allowing, however, certain exceptions of carefully selected occupations for the 14 and 15 year old groups outside of school hours. Suitable provision for the group not able to profit by the ordinary school programme up to the age of 16 was also to be made. At a meeting held in the office of the New York State Industrial Commissioner, which had the support of Governor Lehman, a committee was established to further the establishment of a 16-year age minimum, to obtain additional protection for young workers in hazardous occupations, and to create a minimum wage board for minors in industry. In Massachusetts a special commission, established by the legislature, filed a report which included recommendations for the raising of the compulsory school attendance age from 14 to 16 years. Similar programmes were being formulated for legislative action early in the year. The fact was, in the first two legislative months the investigators of the National Child Labor Committee found that fully one hundred bills had been introduced in various legislatures concerning child labor and school attendance. It was important to observe, however, that such measures were meeting with greater resistance than ever before largely because of the strenuous efforts of tax reform groups to cut public budgets to the bone. Bills providing for a 16-year minimum age were introduced in Connecticut, Massachusetts, New York, South Dakota, Texas, Utah, and Wisconsin. Minimum wage legislation was laid before legislators in Connecticut, New Hampshire, New Mexico, New York, Rhode Island, and Utah. Bills further restricting hours of work or night work, particularly as relating to minors, were brought up in the legislatures of Connecticut, Georgia, Indiana, Massachusetts, Michigan, Minnesota, New York, North Carolina, Pennsylvania, Rhode Island, and South Dakota. In the States of Connecticut, Massachusetts, Minnesota, Nevada, New Jersey, and Rhode Island measures were presented for the purpose of strengthening the minimum wage, work permit, and dangerous occupations sections in child labor codes. Also in Minnesota and Tennessee, street trades bills were being supported; while in Georgia, Indiana, New Hampshire, and Tennessee reformers were working for the enactment of compensation laws insuring double compensation for minors suffering injuries who were being illegally employed.

The legislative history of the year indicated some interesting departures. Utah in one session moved from the rear to the very forefront of the States having progressive child labor codes. The new Utah law set a minimum age of 16 years for all employment during school hours and in many occupations, including any work in connection with machinery; and a minimum of 18 years for specified dangerous occupations. Work permit provisions and a 44 hour week were established for minors under 18, and night work between

the hours of 6 P. M. and 7 A. M. was banned, except for boys over 16. Children over 14 were to be permitted to work without permits in agriculture or domestic service outside of school hours, while street trading was prohibited for boys under 12 and girls under 16, except that boys between 10 and 12 years might distribute papers over fixed routes. Double compensation was to be paid to young workers injured while illegally employed. In Wisconsin a 16-year minimum was established for child labor; also all children between 14 and 16 who had formerly attended vocational school half-time were to attend vocational schools or the regulation high schools full-time. In Connecticut the working hours for minors under 16 as well as women in mercantile establishments, restaurants, cafés, public dining rooms, etc., were reduced. In New Hampshire and Indiana double compensation for minors under 18 injured while illegally employed was established. Mandatory minimum wage rules applying to minors under 21 and to women were set up in Connecticut, Illinois, New Hampshire, New Jersey, New York, Ohio, and Utah. Penalties for the violation of street trades laws were imposed in Minnesota and for the violation of the law prohibiting dangerous occupations for minors under 18 were imposed in New Jersey.

One must observe, however, that bills to establish 16 years as the minimum age for employment during school hours were lost in Connecticut, Illinois, Iowa, Massachusetts, New York, Pennsylvania, South Carolina, South Dakota, and Texas. Revisions of the entire child labor code failed in Nevada, New Hampshire, and Tennessee.

A sudden victory for the cause of child labor came with the signing of the cotton textile code under the aegis of the National Recovery Administration. This, what must be regarded as an historic document, was promulgated on July 9, and barred the employment of children under 16 years from what had always been considered as the stronghold of child labor, the textile industry. On July 20, President Roosevelt made public a blanket agreement for all industries not yet submitting codes under the NRA and the first section provided that children under 16 were not to be employed, except that the 14 and 15 year olds not in manufacturing and mechanical industries might work a three hour maximum between 7 A. M. and 7 P. M. in such activities as would not interfere with hours of day school. Thereafter the 16-year minimum increasingly appeared in all codes which began to receive the examination and sanction of the NRA administrators. The cloak and suit industry code even went further and specified an 18-year age minimum for manufacturing employees. Among the first thirty industrial codes only two allowed the employment of children under 16 years of age under any circumstances. In legitimate theatres child actors were to be permitted in special parts. In the bituminous coal code, a clause prohibiting employment under 16 years in any capacity in the industry was omitted but provision was made for the banning of child workers under 17 years underground or in hazardous occupations above ground. Although in the cotton textile code the employment of learners or apprentices was not strictly regulated as to the number permitted, wages and length of the apprenticeship period, the wool textile code allowed no exception from the minimum wage rates for learners or any other class of workers; while the lace manufac-

turing code restricted the learning period to six weeks, the numbers of learners to one for every 6 skilled workers, and the learners' pay to not less than 80 per cent of the basic rate. A great victory gained was the elimination of the home work system in the major garment industries. Here with one clean blow child labor in industrial home work was wiped out. The code for the retail trades and drug stores followed the blanket code in allowing employment for three hours a day for children between 14 and 16 years. Under the terms of this code an alternative was incorporated permitting such children to work eight hours a day for one day a week. In either case such work was to take place between 7 A. M. and 7 P. M. and was not to interfere with the child's hours at school. The code also prohibited children under 16 years from delivering merchandise from motor vehicles. The following summary indicates a partial list of industries in which age minimums were established: Straight 16-year minimums were incorporated in the codes of these industries: artificial flowers and feathers; automobiles; corsets and brassières; cotton textiles; electrical manufacturing; fishing tackle; hosiery; iron and steel; lace manufacturing; leather, linoleum and felt base; men's clothing; motion picture laboratory; oil burners; petroleum; photographic manufacturing; rayon and synthetic yarns; ship building and ship repair; textile bag; transit industry; underwear manufacturing; wall paper manufacturing. In addition to the modifications cited above, the following also may be noted: in the cast iron soil pipe industry the minimum was fixed at 18 for hazardous foundry operations; in gasoline pumps the minimum was 18 on metal working machines; in lumber the minimum was 18 except for boys over 16 in non-hazardous occupations during school vacations or if no wage earners over 18 were in the family; in salt producing the minimum was 21 for all underground work in mines.

Before the year was over it was estimated that as a result of the operations of the codes under the NRA fully 100,000 children had gone back to school. However, the depression was causing a real crisis in education. The demands for economy in the public services and the increasing inability of local jurisdictions to provide adequate educational facilities, not to speak of meeting of teacher payrolls and the maintenance of schools already in existence, had brought about an alarming state of affairs. In Arkansas, Alabama, Idaho, North and South Dakota, as well as in other mid-western and southern States, thousands of school districts were unable to maintain their schools as much as 120 days during 1932-33. It was estimated that approximately 100 city school systems and 4500 rural schools had reduced their terms a month or more. While 100,000 children, thanks to the elimination of child labor, had been turned back to the schools, fully another 100,000 children were shut out of schools because of inability to finance before the year had closed. The National Education Association pointed out that the expenditure for new school buildings fell from \$400,000,000 in 1925-26 to \$155,000,000 in 1932-33; 250,000 children were attending school part time because of the drop in school rooms and that another 150,000 were housed in temporary or portable schools. It was hoped that the Public Works Administration, set up under the New Deal, would make

available funds for the construction of new school buildings in areas where they were sorely needed, and friends of child education were making all efforts to bring the lamentable state of affairs in school construction to the attention of Administrator Ickes. But these public works funds were moving slowly due to the necessity for close scrutiny of all the projects submitted with the result that little relief seemed in sight as the year closed.

CHILD LABOR AMENDMENT. The child labor amendment in 1933 was taking on a new lease of life. The 14 States of Illinois, Michigan, New Hampshire, New Jersey, North Dakota, Ohio, Oklahoma, Oregon, Iowa, West Virginia, Minnesota, Maine, Pennsylvania, and Washington ratified during the year bringing up to 20 the number of States which had taken favorable action on the measure since its passage by Congress in 1924. States which had previously ratified were Arizona, Arkansas, California, Colorado, Montana, and Wisconsin. The curious change in opinion of course in large measure was hastened by growing unemployment among adults while children continued to be favored for available jobs because of their willingness to accept lower wage levels. From Pennsylvania, the State employing the largest number of children under 16 years of age in manufacturing and mechanical occupations, according to the census of 1930, there issued the following warning (*Philadelphia Public Ledger*):

This pending amendment is a reminder that unless the States which for years have tolerated child labor in its most vicious form shall of themselves reform that situation, national opinion and constitutional change will yet be invoked. Unless reforms are made within the next few years, it is virtually certain that there will be renewed agitation for ratification of this amendment.

The text of the amendment reads as follows:

Section 1. The Congress shall have power to limit, regulate, and prohibit the labor of persons under 18 years of age.

Section 2. The power of the several States is unimpaired by this article except that the operation of State laws shall be suspended to the extent necessary to give effect to legislation enacted by the Congress.

CHILD LABOR IN TOBACCO FIELDS. Tobacco growers, representing 95 per cent of the industry in Connecticut and Massachusetts, signed a voluntary agreement not to employ children under 14 years on tobacco plantations. As the *American Child* points out this was a great victory. For many years those interested in child labor had protested in vain against exploitation of children on tobacco plantations. This acceptance, without legislative mandate, of the 14-year-old minimum was calculated to bring about improvement of conditions without giving any single employer an advantage.

CENSUS REPORT. From 1910 to 1920 the number of children from 10 to 15 years of age gainfully employed in the United States decreased from 1,990,225 to 1,060,858, or 46.7 per cent; from 1920 to 1930 the decrease was from 1,060,858 to 667,118, or 37 per cent. In the earlier decade there was a rise in school attendance in the same age group from 9,203,671 to 11,132,527, or 21 per cent; by 1930 the number of children attending school was 13,495,044, or an increase of 21.2 per cent over 1920.

On the other hand there were a few increases which stand out vividly. In several southern States the percentage of textile workers of 16

and 17 years showed an increase since 1920. In the clothing industries in some of the New England and Middle-Atlantic States a shift from older to younger workers took place. In Connecticut and Rhode Island, for instance, the number of workers 16 and 17 years old in the clothing industry increased from 123 per cent to 283 per cent respectively; in New Jersey, the increase was 81 per cent; in Pennsylvania, it was 62 per cent; and in Massachusetts, it was 52 per cent.

CHILDREN IN SWEATED INDUSTRIES. In some States children in sweated industries were becoming increasingly common. In Connecticut, particularly, the conditions in the so-called "runaway shops" of the garment-making industry earned the condemnation of all friends of children in industry. Sweating in runaway shops was also being noted in Pennsylvania and Massachusetts. In Massachusetts attention was called to the situation through the efforts of the State minimum wage commission to enforce the minimum wage law. The following statement was more or less typical of hours and conditions of employment that child workers were being compelled to submit to. (*Monthly Labor Review*; March, 1933.)

An investigation made by the Massachusetts Minimum Wage Commission last spring disclosed that rates as low as 10 cents, and in one case, 5 cents an hour were paid to girl workers in Fall River; hundreds were earning less than \$5 a week. In five plants investigated, manufacturing men's furnishings, women's underwear, house dresses, children's dresses, only five employees earned more than \$15 a week. Of 1616 employees in 13 plants making women's apparel 71 per cent earned less than \$10 a week, and 97 per cent earned less than \$15 a week. In one of the worst-paid shops hourly rates ranged from 10 cents to 16 cents an hour; the earnings of these workers, if employed for a full week of 48 hours, would range from \$4.80 to \$7.68 a week. Practically all the shops paying these low wages had started business in the town since the beginning of the present depression. Many factories of similar character have been established in other Massachusetts cities during this period. In New Bedford, for instance, it was found that wages paid were even lower than in Fall River, and check ups at later dates revealed that, even after investigation by the minimum wage commission, wages were continuing downward.

A report made by the Pennsylvania State Department of Labor and Industry, as regards industrial home work in that State in 1931, found that because of hard times conditions in some work had grown worse and the process of deterioration was continuing because of the inability to closely supervise such activities. The report went on to state: Violations of the child labor law have nearly doubled and violations of the woman's law have quadrupled. Many employers, rushed to fill orders, have in turn pressed their home workers into violations of the labor laws. Workers, many of them living in poverty whether from unemployment, low earnings, or both, often put their children at the tasks or themselves worked overtime in order to keep their employer's favor and to earn a few cents. Employers and workers alike have grown careless of labor standards and have ignored the fact that, in their attempts to keep going at any price, all tend to be reduced to the same low standard from which each would escape.

GREAT BRITAIN. A report issued by the British

Ministry of Labor on the work during 1931 of the local committees for juvenile employment made public the following conditions as affecting child labor in Great Britain. There were 80,000 fewer juveniles available for work in 1931 than in 1930, the lowered birth rate due to the war having affected for the first time the 16- and 17-year olds, the age of entry into employment insurance. Thus, the number of insured juveniles showed a decline for the first time since 1928, the total for 1931 standing at 1,010,000 for the whole of Great Britain. Employment was better among girls than among boys, and the disparity increased during the year, girls apparently replacing boys in the lighter manufacturing industries and in clerical and commercial work. Juvenile unemployment was less pronounced in London and the south than in the industrial north and in Wales. The percentage of insured juveniles unemployed was much lower than among adults; the average for the year was 7.6 per cent in 1931 as compared with 5.7 per cent in 1930, while the insured adults unemployed was 22.7 per cent in 1931 and 16.8 per cent in 1930. The local committees concerned themselves also with vocational guidance, during 1931, finding 306,821 jobs for juveniles which were about equally distributed between boys and girls. Short time working among juveniles decreased but non-progressive occupations were still prevalent and were causing serious concern to the agencies. See LAW.

CHILD PSYCHOLOGY. See PSYCHOLOGY.

CHILDREN'S BUREAU. See CHILD WELFARE.

CHILD WELFARE. A study made by the Children's Bureau indicated that work for the protection of the health and lives of children has had a long history in the United States.

MOTHERS' ASSISTANCE. A survey made by the Children's Bureau of the status of mothers' aid in the various States in 1931 showed that more than 250,000 dependent children were being cared for in their own homes in the 44 States and the District of Columbia where mothers' aid laws were in operation. The number of families thus assisted increased from 45,825 in 1921 to 93,620 in 1931. While but four States—Kentucky, Mississippi, North Carolina, Rhode Island—and the District of Columbia passed such legislation over the period 1921–31, the increase was really due to the many more counties granting aid. In 1931 the number of families averaged 10 for every 10,000 population, the rates varying, however, from 1 per 10,000 in Maryland to 24 in Wisconsin. Over \$33,000,000 was spent for such grants to mothers in the year ended June 30, 1931. Annual per capita expenditures based upon the population of reporting areas varied from 3 cents per capita in Louisiana and North Carolina to 82 cents in New York. The high per capita expenditure in such States as Massachusetts, Michigan, New York, and Wisconsin brought the expenditures for all areas to 38 cents per capita. The size of the monthly allowance to the individual family varied widely. The average monthly grant ranged from \$69.31 in Massachusetts to \$4.33 in Arkansas; South Carolina was the median State with an average monthly grant of \$21.78. Within the decade 1921–31 there was an increasing progress manifested in the nature of the legislation, benefits of the law being made available to more children and efforts being taken to make the grants more nearly equal to the needs of the families. There was a gradual broadening in the

definition of the persons eligible for assistance and an increase in the number of States granting aid to children up to the age of 16.

MATERNAL DEATHS. According to a report published by the Commonwealth Fund and made by a sub-committee of the Committee on Public Health Relations of the New York Academy of Medicine, nearly 66 per cent of the mothers who died of child birth in New York City in the years 1930, 1931, and 1932 could have been saved by the application of proper medical knowledge. In the three years indicated, 2041 maternal deaths occurred in New York City, of which 1343, or 65.8 per cent could have been prevented "if the care of the woman had been proper in all respects." Responsibility for these deaths was distributed among physicians, patients, and midwives. To the medical group 61.1 per cent of all the preventable deaths were charged; patients were held responsible for 36.7 per cent; and midwives for only 2.2 per cent. The committee, on the basis of a case work analysis of each death that occurred, was able to declare that the following factors were significant in affecting maternal mortality: the widespread use of anesthesia, the decline in spontaneous deliveries, the greater frequency with which operative measures were employed, Cæsarean sections, inadequate pre-natal care, the economic status of the patients, and the like. The report pointed out that according to authoritative estimates not more than 5 per cent of all delivery cases required operative interference. On the other hand in 67 hospitals in which almost 75 per cent of all hospital deliveries occurred, operative interference was practiced in 24.3 per cent of all the cases. The committee, in comparing maternal deaths in operative delivery with those in which delivery was spontaneous, found that the maternal mortality was five times as high among the operative deliveries as among the spontaneous ones. A little less than 30 per cent of all deliveries studied took place in the home. It is interesting to note that only 14.5 per cent of the 1343 preventable deaths followed delivery in the home. The relative death rates per 1000 live births for hospital and home deliveries were 4.5 per 1000 live births in the hospital, and only 1.9 per 1000 live births in the home. The committee, however, makes an observation that should be borne in mind: "It should be remembered . . . that only those deliveries which are unassociated with serious abnormalities are usually undertaken in the home."

The results of a similar investigation, but on a much wider scale, were made public by the Children's Bureau based upon a detailed and scientific investigation of 7380 deaths of mothers in 15 States. This inquiry covered every maternal death in 19 States for 2 years and in 2 additional States for 1 year, including personal interviews with the attendant of the woman who died. The Obstetric Advisory Committee of the Bureau pointed out, after an analysis of the data, that probably one-fourth of all the maternal deaths indicated were not due to maternal mortality as the general public accepted this term. Follow-up of death records revealed that 1825 women died following ending of pregnancy so premature that the infant could not survive. Of this number 1324 died from sepsis, and in 50 per cent of the cases of known type these deaths followed attempt by the women themselves to avoid motherhood. Another important fact revealed by the study was the large proportion of women who

had little or no maternal care. Of the women on whom a report on pre-natal care could be obtained, 54 per cent had no pre-natal examination by a physician. This lack of pre-natal care was held a factor in the second largest cause of maternal deaths. Since 30 per cent of the deaths studied was preceded by some presumably toxic condition, 26 per cent being due to albuminuria and convulsions, special emphasis was placed by the committee on the education of the public as a necessity for pre-natal care. The report pointed out that physicians and communities had important tasks to perform in the education of expectant mothers and the provision of proper clinical and hospital facilities for care before, during and after pregnancy. Said the report: "The community has a definite responsibility to provide adequate medical and nursing facilities for the care of women during pregnancy, labor, and post-partum. This predicates the proper organization of hospitals, out-patient services, and medical and nursing personnel, and applies to both home and hospital care."

HEALTH AND NUTRITION OF CHILDREN. On the basis of a study made by the Children's Bureau it was ascertained that the depression was having a real and increasingly severe effect on the health and nutrition of children. Data which were compiled through interviews or correspondence with persons interested in the problem pointed to the fact "that the nutritional condition of children in many communities is showing increasingly serious effects of the long periods of unemployment and want." It was estimated that somewhere in the neighborhood of one-half of all pre-school and school children in the United States were showing the effects of poor nutrition, inadequate housing, lack of medical care, and of the anxiety and insecurity prevailing in homes where there was no employment. Statistical corroboration for this belief was based upon the New York City's Health Department annual study of more than 300,000 school children. During the three years 1927, 1928, and 1929, the percentage of malnutrition was only 13 per cent; in 1930, it was 16 per cent; in 1931, 17 per cent; and in 1932, 21 per cent. A Detroit study made in the fall of 1932 showed that out of a group of 1140 school children, 11 per cent were definitely malnourished and 7 per cent additional were underweight for height. Of those showing clinical evidences of malnutrition, 68 per cent were declared to be anæmic. Fully one-third of the children in this malnourished group were thought by those making the study to be "primarily due to the economic restrictions caused by the present depression." A report made by the Community Health Centre of Philadelphia indicated an increase of malnutrition among children of school age from an average of 30 per cent of those examined during 1928-30 to 42 per cent of those examined in 1932. Among children under six the percentage of malnourishment showed a definite rise, increasing from 11 per cent in the period 1928-30 to 23 per cent in 1932. Of the 2381 school children in coal mining regions in two States examined by the American Friends Service Committee in 1931, more than half were 10 per cent underweight; in some schools as many as 90 per cent of the children were in the underweight group. The Children's Bureau report also declared that there were indications pointing to the fact that malnourishment among mothers was having its effect upon new born

babies and nurselings. Increases in the incidence of rickets were reported from several localities in Maryland, Pennsylvania, New York, and Connecticut.

CONFERENCE ON CHILD HEALTH AND NUTRITION. At the call of the United States Children's Bureau there was assembled in Washington on October 6 a conference to consider the general subject of malnutrition among children as well as measures for coping with it. Delegates representing organizations having over 50,000 members and coming from the groups of medical and health workers, educationalists, nutritionists and home economists, and social service agencies, were present from all parts of the country. A preliminary report, submitted by an executive committee, in pointing out the seriousness of the problem, presented two objectives to advance the united efforts of all different groups concerned with the health, education, and training of children. These were: 1. the location of under-nourished children by physical examinations; 2. the initiation and development of plans to overcome existing malnutrition through dietary measures and corrective medical procedure. Discussion among the conferees indicated that agreement existed on these two points: 1. That before the depression began there were decided evidences of malnutrition among the children of the country. It was, therefore, pointed out that any effort simply to annul the effects of the depression would be inadequate; any campaign in order to be effective must have as its goal the improvement of conditions over the situation existing before the depression had occurred. 2. Malnutrition and under-nourishment, it was pointed out, were not necessarily nor solely due to poverty. Therefore, an educational campaign was as important as a campaign for relief. Reports were submitted to indicate that malnutrition had increased during the depression and that immediate and effective remedial action was imperative. Dr. Earl G. Browne, state health officer of Kansas, reported that the examination of 38,000 school children in that State had shown that 25 per cent were suffering from malnutrition, and that 70 per cent of those in agricultural districts were not drinking milk. From other regions came reports similarly stressing the need for united action along relief, preventive and educational lines. The objectives presented by the executive committee of the conference were approved with the suggestion that there might be possible modifications to apply to the special conditions of the different States.

SCHOOL CHILDREN. In an effort to ascertain how many public schools throughout the land were being slowly undermined because of the drive for economy and the lack of public funds, the National Education Association, through one of its committees, made a survey of the rural school situation in several representative States. Inquiries were sent to 3520 county school superintendents or equivalent rural or State school officers, and replies were received from 1886 such officials. These replies indicated that in September, 1933, there were 2016 rural schools which failed to open because of lack of funds, indicating that 110,800 children who would ordinarily have been pupils at such schools were denied educational opportunities. In addition, 715 schools were unable to operate more than three months and as a result, 35,750 children's school year was sharply curtailed. Another 18,290 schools were

not in a position to keep open more than 6 months and in these 914,500 children were affected. In an effort to ascertain existing minimum wage levels for school teachers, with the \$750 annual wage set in the President's blanket code as a basis for comparison, the N.E.A. committee also made inquiries along these lines. It was ascertained that in the 1886 counties from which replies were received, 209,573 teachers were receiving less than \$750 a year while 84,036 teachers were receiving less than \$450 a year. In short, out of the approximately 450,000 school teachers in the rural areas, one out of every two was receiving an annual salary less than \$750, and one in every five was receiving less than \$450.

FAMILY ALLOWANCES. In *Belgium* on Dec. 31, 1932, there were 86 primary family allowance funds operating under the family allowance act of Aug. 4, 1930. These funds covered 83,994 enterprises employing 1,273,701 workers and toward whose support employers had paid assessments for the year which totaled \$6,742,240. Up to the end of 1932 the primary funds had disbursed in family allowances a total of \$6,373,701. In *New Zealand* during the year ending Mar. 31, 1932, the number of family allowance claims handled under the act passed in 1926 totaled 3722 of which 3040 were approved. The total number of families receiving allowances on Mar. 31, 1932, was 7332; and during the year ending on that date the total amount paid out in allowances was £90,100 and the total paid for the four years ending Mar. 31, 1932, was £307,159. The number of children in the 7332 families in receipt of allowances was 34,546 of whom 19,882 were in families having more than two children. The average number of children per family was 4.71. Of the 3040 families whose claims for allowances were granted in the year 1931-32, 1206 had weekly incomes over £3 and up to £3. 12s. The weekly rates at which the allowances were granted were as follows: weekly rate of 1s., 6 families; 2s., 1127 families; 3s., 10 families; 4s., 946 families; 5s., 9 families; 6s., 508 families; 8s., 264 families; 10s., 105 families; 12s., 52 families; 14s., 7 families; 16s., 4 families; 18s., 2 families.

CHILE, chē'lā, or chī'l. A South American republic. Capital, Santiago.

AREA AND POPULATION. With an area of 280,396 square miles, Chile had an estimated population on Jan. 1, 1933, of 4,402,000 (4,287,445 at the 1930 census). The people are mainly of European descent. The census population of the chief cities in 1930 was: Santiago, 696,231; Valparaíso, 193,205; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458; Talca, 45,020. The registered movement of population in 1932 was: Living births, 149,471; deaths, 99,664; marriages, 28,812.

EDUCATION. Primary education is free and compulsory. In 1932-33 there were 3344 public elementary schools, with 437,944 pupils; 712 private elementary schools, with 57,427 pupils; 81 secondary schools, with 24,869 pupils; and 3 universities, with 6360 students.

PRODUCTION. The chief occupations are agriculture (central Chile), mining (northern zone), and lumbering and stock raising (southern Chile). A total of 8,344,000 acres (4.6 per cent of the area) was arable; meadow and pasture, 51,646,000 acres; forest, 11,232,000 acres. Crop yields in the 1931-32 season (thousands of units, bushels except as indicated) were: Wheat, 21,187; bar-

ley, 3097; oats, 4923; corn, 2951; potatoes, 15,053; beans, 2340; peas, 623; wine (gallons), 63,695. The wool production in 1932 was 32,500,000 pounds (29,600,000 in 1931). Mineral output in 1931, with 1932 figures in parentheses where available, was: Gold, 16,716 fine ounces (38,096); silver, 372,000 fine ounces (73,422); copper (smelter), 215,700 metric tons (97,500); iron ore, 712,000 metric tons (171,000); nitrate of soda, 1,125,000 metric tons (2,446,000 in 1930 and 3,233,000 in 1929); iodine, 184,000 pounds in 1930; coal, 1,442,000 metric tons (1,107,000). The nitrate mines employed 65,000 persons in 1930. For the 1933 situation of the industry, see *History*.

Due to the restriction of imports the index of industrial production (Base: 1927-29 equals 100) rose from 74.4 in 1931 to 107.6 in 1932; it was 116.1 in 1929. There were 8585 manufacturing establishments, with 97,832 employees, in 1928.

COMMERCE. Preliminary 1932 foreign trade figures showed imports of 213,800,000 pesos (\$16,890,000), compared with 705,902,000 pesos (\$85,202,000) in 1931. Exports amounted to 350,300,000 pesos (\$27,709,000), against 824,739,000 pesos (\$99,546,000) in 1931. (Conversions to dollars made at average exchange rates of \$0.1207 in 1931 and \$0.079 in 1932; par value of gold peso equals \$0.1217.) The chief exports in 1932 were: Copper ingots and bars, \$10,693,000 (\$36,999,000 in 1931); sodium nitrate, \$4,034,000 (\$43,296 in 1931 and \$116,483,000 in 1929); sheep's wool, \$1,955,000 (\$2,687,000 in 1931); iodine, \$1,447,000 (\$1,028,000). The principal 1931 imports, in order of value, were machinery, iron and steel manufactures, cotton fabrics, sugar, chemicals, etc. In 1932 the United States took 28.1 per cent of Chile's exports (33.4 per cent in 1931); the United Kingdom, 26.9 per cent (16.3); Germany, 7.9 (9.0); and France, 4.7 (11.7). Of the total imports, the United States supplied 23.1 per cent (34.2 per cent in 1931); Germany, 14.8 (16.5); the United Kingdom, 12.9 (16.0). The 1933 imports were 181,600,000 pesos; exports, 368,100,000 pesos.

FINANCE. Closed budget accounts for 1932 showed total revenues of 831,401,000 pesos (ordinary, 514,757,000; extraordinary, 316,644,000) and total expenditures of 1,136,699,000 pesos (ordinary, 703,609,000; extraordinary, 431,990,000). The deficit was 304,198,000 pesos, including 196,122,000 pesos overdrawn at the end of 1931 and 2,424,000 pesos of unpaid obligations from the 1931 budget. Budget estimates for 1933 called for ordinary receipts and expenditures of 945,662,000 pesos and 945,593,000 pesos, respectively. The expenditures included 207,658,000 pesos for public works and unemployment relief previously included in the extraordinary budget. The 1934 budget, as approved by Congress, authorized expenditures of 830,495,995 pesos and estimated revenues at 830,499,000 pesos.

The direct public debt on Dec. 31, 1932, amounted to 3,786,020,000 pesos (external, 2,430,829,000; internal, 934,119,000; bank and short-term advances, 421,072,000), compared with 3,309,630,000 pesos on Dec. 31, 1931. The indirect debt, guaranteed by the government, was 1,281,524,000 on Dec. 31, 1932 (external, 1,227,306,000; internal, 54,218,000). Service on the entire foreign debt was suspended July 30, 1931. Internal debt service was continued.

COMMUNICATIONS. Chile had in operation in 1931, 5515 miles of railway line, of which the State Railways operated about 3600 miles. In 1931 all lines carried 13,855,000 passengers and

21,282,000 metric tons of freight, gross receipts totaling 289,428,000 pesos (\$33,727,000 at average exchange rate). The State lines in 1932 reported a deficit of 30,000,000 pesos (31,000,000 in 1931). Of some 25,000 miles of highway, about 16,000 miles were fit for motor traffic. National air lines link the chief cities of Chile from Santiago to the northern boundary and the Pan American Airways connected Chile with most of the other American countries. The net tonnage of vessels entered at Chilean ports with cargo and in ballast in 1932 was 1,163,000 registered tons; cleared, 1,175,000 tons.

GOVERNMENT. The Constitution of Oct. 18, 1925, vested executive power in a president, assisted by a cabinet responsible to him. Legislative power rests in a national congress, consisting of a senate of 45 members, elected for eight years and representing nine provincial groups of departments, and a chamber of 142 members elected for four years by departments or groups of departments. The President is elected for six years by direct popular vote and is ineligible to succeed himself. President in 1933, Arturo Alessandri (Moderate Socialist), who assumed office Dec. 24, 1932.

HISTORY

ECONOMIC RECOVERY. Chile experienced a definite improvement in basic economic conditions during 1933. The economic depression was not banished, but its rigor was checked and economic suffering of the people somewhat alleviated. The business recovery was attributed to a combination of monetary and other policies. Drastic restriction of the export markets for Chilean nitrate, minerals, and agricultural products resulted in the abandonment of the gold standard, the depreciation of the peso, and the practical exclusion of imports due to the lack of foreign exchange. This in turn stimulated manufacturing for the domestic market. Exports of Chilean manufactured products were encouraged by the fact that the peso depreciated more rapidly on the international exchange market than within Chile. The index of national industrial production (1927-29 equals 100) rose from 92.7 in August, 1932, to 110.1 on Aug. 31, 1933. Gains were reflected in both internal and external trade. The government supplemented the industrial pickup by aiding 100,000 unemployed to find work in gold mining and in agriculture. As the year progressed, recovery in other parts of the world stimulated Chilean exports of nitrate and copper. Government revenues increased and the Alessandri Administration was able to balance the budget and restore public confidence in the currency.

The government's inflationary policy had benefited raw material producers, debtors generally, and the unemployed. But the workers and savers had suffered through a sharp rise in the cost of living. Toward the end of the year the government acted to check a further depreciation of the currency and to restore an equilibrium between living costs and wages. One result of Chile's economic semi-isolation was the establishment of many new industries. New blast furnaces, able to supply one-fifth of Chile's iron and steel requirements, were opened at Corral, near Valdivia, on Sept. 23, 1933.

THE NITRATE INDUSTRY. The nitrate industry, which in previous years had been a leading factor in Chilean economy, continued in the doldrums. In August, 1933, only 7600 workers were employed

in the industry, compared with 58,000 in 1929. Throughout 1933, the government continued its efforts to rehabilitate the industry. The so-called Cosach nitrate monopoly, established by President Ibañez and owned jointly by the Chilean government and foreign nitrate companies, was ordered liquidated on January 2. A new government bill for the establishment of a new sales corporation to replace Cosach was before the Chilean Congress during the latter part of the year. After numerous amendments it was ready for passage as the year closed. It invested a government-created corporation with a 35-year monopoly to sell all Chilean nitrate and iodine, paying the producers cost plus \$1.50 per ton on nitrate.

POLITICAL DEVELOPMENTS. During 1933, comparative order and peace succeeded the succession of revolts and disorders which had marked the previous years of the depression. Several plots against the Alessandri régime were nipped in the bud. Discovery of an alleged Communist plot, involving soldiers and sailors, caused the arrest of some members of the Workers' Federation on February 25. Col. Marmaduke Grove, former Minister of Defense and a leader of the Socialist revolt of July, 1932, was arrested on charges of subversive activity August 10. The threat of a new radical outbreak against President Alessandri's moderately socialistic government was met by the organization of a semi-Fascist militia, headed by Eulogio Sanchez Errazuriz. This organization, known as the Milicia Republicana, paraded 15,000 members through Santiago on May 7. It was reported to be fully armed and equipped. It was pledged to defend constitutional government, and repudiated fascism.

A rival organization to the Milicia Republicana appeared later in 1933 in the Chilean National Socialist party, headed by Jorge Gonzalez and Fernando Ortuzar Vial and modeled on the German Nazi movement. It was frankly Fascist in aim, demanding the elimination of party government. Despite the Milicia Republicana's support, the government on December 13 secured extraordinary powers for six months to crush threatened subversive movements.

FOREIGN RELATIONS. Chile remained on friendly terms with all its neighbors during 1933. The Foreign Office joined with those of Argentina, Brazil, and Peru in attempting to end the struggle between Bolivia and Paraguay in the Chaco. Dr. Miguel Cruchaga Tocornal, Chilean Foreign Minister, met Foreign Minister Saavedra Lamas of Argentina in Mendoza, Argentina, early in February for a two-day conference. They signed a comprehensive Chilean-Argentinian treaty, which was later ratified (see ARGENTINA under *History*). They also elaborated the so-called Mendoza proposals for settlement of the Chaco war (see BOLIVIA under *History*). Following Paraguay's declaration of a state of war on May 10, 1933, Chile declared her neutrality May 13. Contrary to Paraguayan hopes, Chile refused to bar the passage of Bolivian arms and war supplies through the Pacific port of Arica. On May 30, she officially notified Bolivia that the port would remain open. On October 10, the Chilean government joined those of Argentina and Brazil and several other Latin American governments in signing the Argentina anti-war pact and nine other multi-lateral treaties (see ARGENTINA and BRAZIL under *History*).

CHINA. A republic of eastern Asia. Capital, Nanking.

AREA AND POPULATION. Including the four northeastern provinces of Liaoning (Fengtien), Kirin, Heilungkiang, and Jehol united in the Japanese protectorate of Manchoukuo, and the dependencies of Sinkiang (Chinese Turkestan), Mongolia, and Tibet, China has a total area of about 4,300,000 square miles and a population estimated at 474,821,000. The area is approximately that of the United States and Mexico combined and the population comprises about one-fourth of the world's inhabitants. The estimated area and population of the Provinces and dependencies in 1930 is shown in the accompanying table. Capitals of the respective Provinces are in parentheses.

AREA AND POPULATION OF CHINA BY PROVINCES

Province (Capital)	Sq. miles	Population
Anhui (Anking)	55,090	21,715,000
Chahar (Kalgan)	99,928	1,997,000
Chekiang (Hangchow)	39,020	20,643,000
Fukien (Foochow)	56,737	10,017,000
Heilungkiang * (Tsitsihar)	223,151	3,755,000
Honan (Kaifeng)	66,469	30,566,000
Hopeh (Tientsin)	54,257	81,233,000
Hunan (Changsha)	83,188	31,501,000
Hupeh (Wuchang)	70,312	26,699,000
Jehol * (Chengteh)	67,166	6,594,000
Kansu (Lanchow)	147,051	6,281,000
Kiangsi (Nanchang)	64,956	20,323,000
Kiangsu (Chinkiang)	40,774	34,126,000
Kirin * (Kirin)	109,008	7,635,000
Kwangsi (Nanning)	84,894	13,648,000
Kwangtung (Canton)	86,426	32,428,000
Kweichow (Kweiyang)	68,139	14,746,000
Liaoning * (Mukden)	96,839	15,233,000
Outer Mongolia * (Ulan Bator Hoto)	622,744	6,160,000
Ningxia (Ningsia)	116,776	1,450,000
Shansi (Taiyuan)	62,487	12,230,000
Shantung (Tsinan)	59,348	25,673,000
Shensi (Sian)	75,319	11,802,000
Sikang (Kangting)	182,510	8,806,000
Sinkiang (Tihwari)	633,802	2,552,000
Suiyuan (Kueihuaicheng)	117,896	2,123,000
Szechwan (Chengtu)	115,843	47,893,000
Tibet * (Lhasa)	349,419	3,722,000
Tsinghai (Sining)	281,156	6,195,000
Yunnan (Yunnanfu)	153,892	13,821,000
Total (approximate) ..	4,314,097	474,821,000

* The "three eastern provinces," Liaoning (Fengtien), Kirin, and Heilungkiang constitute the geographical region referred to as Manchuria, which on Feb. 18, 1932, was proclaimed the free state of Manchoukuo (State of the Manchus). Jehol was incorporated in Manchoukuo in 1933. * Dependencies.

The population of the chief cities, as estimated for 1931 by the Chinese Maritime Customs Office, was: Shanghai area, 3,259,114; International Settlement of Shanghai, 1,007,868; Peiping, including suburbs, 1,297,718; Tientsin, 1,387,462; Harbin, 330,436; Dairen, 282,665; Newchwang, 106,040; Chefoo, 131,659; Tsingtao, 390,337; Chungking, 635,000; Wanhsien, 210,837; Changsha, 606,972; Hankow, 777,993, (including Wuchang and Hanyang); Wuhu, 135,385; Nanking, 633,452; Chinkiang, 199,776; Soochow, 260,000; Hangchow (municipal area), 506,930; Ningpo, 218,774; Wenchow, 631,276; Foochow, 322,725; Amoy, 234,159; Canton, 861,024.

Foreigners in China in 1931 were estimated by the Customs authorities at 380,393, including 260,621 Japanese, 66,479 Russians, 13,344 British, and 8637 Americans. The number of Chinese resident abroad was estimated in 1928 at about 6,245,682, including 1,456,264 in British India and the South Seas. The population is predominantly Buddhist, although most Chinese profess Confucianism and Taoism also. Mohammedans number about 20,000,000; Roman Catholics (1929),

about 2,486,841; Protestants (1922), 806,926.

EDUCATION. Attendance of children and adults of both sexes at schools of all grades in 1931 was estimated at about 10,000,000. In 1928-29 there were 34 universities and colleges and 16 technical high schools with an enrollment of 19,453. These included eight government universities. In 1929-30 a total of 1484 students were granted certificates to study abroad.

PRODUCTION. The population of China is 80 per cent agricultural, but only about 10 per cent of the total area is cultivated. Farms average from 2 to 8 acres in extent and produce from two to four crops per year. China is the world's leading producer of rice, soy beans, tea, kaoliang, sweet potatoes, millet, and vegetable oils, is second in the production of raw silk, and about third in the production of wheat and cotton. The average wheat crop is about 800,000,000 bushels; the 1932-33 cotton crop was 1,099,000,000 pounds (813,000,000 in 1931-32). Corn, tobacco, fruits, and vegetables are other leading crops. China is also the world's principal exporter of eggs.

China is one of the world's leading producers of antimony, tin, tungsten, and manganese ores. It has extensive coal deposits, the annual output amounted to about 29,000,000 metric tons (11,000,000 tons from the Fushun field in Manchuria). Iron ores are mined in Shansi, Hopeh, Shantung, and Manchuria; total output, about 2,000,000 tons annually. Salt, petroleum, wolfram, molybdenum, bismuth, gold, and silver are produced.

Industrialization is proceeding rapidly in the larger cities. The cotton textile industry is most highly developed; in 1932 there were 128 spinning mills, 4,493,000 spindles, and 44,000 looms, which consumed 1,195,000,000 pounds of cotton. Other industrial enterprises include flour mills (173 in Shanghai alone), iron foundries, shipyards, railway shops, cement plants, cigarette factories, engineering plants, knitting mills, silk filatures and looms, rubber-shoe factories, printing and publishing houses.

COMMERCE. In 1932 general imports into China were valued at 1,062,617,000 haikwan taels (\$361,290,000), compared with 1,448,187,000 haikwan taels (\$521,347,000) in 1931. Exports of Chinese products totaled 492,641,000 haikwan taels (\$167,498,000), against 909,476,000 taels (\$327,411,000) in 1931. The figures are provisional and conversions to U. S. dollars are made at average exchange rates. The chief import items in 1932 were: Raw cotton, \$40,736,000; rice, \$40,514,000; cotton piece goods, \$26,381,000; kerosene, \$20,537,000; wheat, \$17,587,000; sugar, \$15,678,000; paper, cardboard, pulp, and books, \$14,719,000. The main exports of Chinese products were: Soy beans, \$14,870,000; raw silk, \$10,187,000; tea, \$8,419,000; raw cotton, \$7,023,000; cotton yarn, \$6,507,000; peanuts, \$5,140,000. Of the 1932 general imports, the United States supplied 25.3 per cent (22.2 per cent in 1931); Japan and Formosa, 14.2 per cent (20.4); United Kingdom, 11.2 (8.3); Germany, 6.8 (5.8); and Hong Kong, 5.7 (15.3). Japan and Formosa took 23.2 per cent of the 1932 exports of Chinese products (29.1 per cent in 1931); Hong Kong, 15.3 per cent (16.3); United States, 12.2 (13.2); United Kingdom, 7.6 (7.1); and Germany, 6.1 (2.5).

FINANCE. For the fiscal year ended June 30, 1931, ordinary revenue and expenditure of the Nanking (Nationalist) government was reported

at 560,926,199 and 714,377,453 yuan (silver) dollars, respectively. Estimates for 1931-32 placed revenue at 632,644,906 dollars and expenditure at 682,990,864 dollars, excluding military expenditures of about 406,617,220 dollars. Chinese customs revenues totaled 340,000,000 yuan dollars for 1933, compared with 315,000,000 for 1932. Only a small surplus remained for government administrative expenses after reduction of the collecting charges and the requirements for meeting obligations on foreign loans and internal consolidated debts. Of the total customs revenue, 52 per cent was collected at the port of Shanghai. Besides numerous internal loans, a national lottery was instituted for the first time in 1933, the first lottery netting about 1,500,000 yuan dollars, which was to be spent on aviation and highway development. The national debt on Jan. 1, 1933, was divided as follows: Internal, \$151,442,000 gold (U. S. currency) and 246,064,000 yuan dollars; external, \$317,524,000 gold (U. S.).

Commencing Apr. 6, 1933, Chinese banks, exchanges and commercial concerns were ordered to discontinue the use of the Shanghai and Haikwan tael in favor of the official yuan dollar. Some of the principal coins in use in 1932, with their average exchange equivalents in United States dollars, were: Shanghai tael, \$0.3065; haikwan tael, \$0.34; Hong Kong dollar, \$0.2346; yuan dollar, \$0.2174; Mexican dollar, \$0.2176.

COMMUNICATIONS. There were 10,404 miles of public railways in China and its dependencies in 1931, of which 7715 miles were government and 2689 miles concessioned lines. The chief concessioned lines were the Chinese Eastern (1423 miles), the South Manchuria (786 miles), and the Yunnan railway (389 miles). In 1932 the railways carried 41,415,000 passengers, and 23,530,000 metric tons of freight, the gross receipts totaling 149,488,000 yuan dollars. During 1933 a new standard-gauge light railway between Hangchow and Yushan, on the border of Kiangsi Province, a distance of about 200 miles, was placed in operation. Work was under way on the extension of the Lunghai railway westward from Tungkwan to Sian, capital of Shensi Province. Another light railway between Wuhu and Chapu in eastern Anhwei and Northern Chekiang Provinces, about 156 miles long, was under construction.

A highway survey in 1933 indicated a total of 40,400 miles of completed motor roads, with approximately 30,000 miles under construction. Completion of the Kwangsi-Kweichow interprovincial highway from Wuchow to Kweiyang, a distance of 650 miles, reduced the traveling time between the two points from four weeks to four days. Air mail and passenger lines also were extended during 1933. The China National Aviation Corporation, a Sino-American concern, inaugurated in November a regular biweekly passenger service between Shanghai and Canton, via coast ports. It continued to operate its Shanghai-Nanking-Hankow and Hankow-Chungking lines. A Sino-German company operated a mail and passenger service over the Shanghai-Nanking-Sian-Lanchow route.

Direct trans-Pacific radio communication between Shanghai and San Francisco was opened on May 19, 1933. It was announced that similar service between Shanghai and London would begin Jan. 15, 1934.

GOVERNMENT. The Kuomintang (Nationalist) party exercised all political power and controlled

the Nanking government. For the form of government established by the Organic Law of 1928, see 1932 YEAR BOOK. Effective power throughout the period 1928-33 rested mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nanking armies. The Chairman of the State Council, or nominal President of the Nationalist government, at the beginning of 1933 was Lin Sen. The Chairman of the five Yuans were: Executive, Wang Ching-wei; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-tao; Control, Yu Yu-jen. The Cabinet Ministers, functioning under the Executive Yuan, were: Interior, Hwang Shao-hsiung; Foreign Affairs, Lo Wen-kan; Military Affairs, Ho Ying-ching; Navy, Chen Shao-kuan; Finance, T. V. Soong; Industries, Chen Kung-po; Education, Wong Wen-hao; Railways, Ku Meng-yu; Communications, Chu Chia-hwa.

HISTORY

COLLAPSE OF RESISTANCE TO JAPAN. On Feb. 24, 1933, the League of Nations Assembly adopted a report placing upon Japan the onus for the Sino-Japanese conflict in Manchuria since Sept. 18, 1931. The following day the Japanese military launched their offensive against the Province of Jehol. Sweeping aside weak Chinese resistance, they captured Chengteh, the capital, on March 4 and swept on south of the Great Wall to within a few miles of Peiping and Tientsin (see JAPAN under *History* for a more detailed account). Facing the loss of these important cities and satisfied that the continuance of the military struggle with Japan was hopeless, the Chinese on May 31 concluded a formal truce with the Japanese at Tangku. The truce provided for the demilitarization of a large section of China Proper lying between the Great Wall, the Gulf of Chihli, and a line running roughly east and west a short distance north of Peiping and Tientsin.

By signing the truce China tacitly abandoned Manchuria and Jehol to Japan. Equally significant, China's surrender was forced by direct military pressure and in violation of the principle laid down by the League of Nations that Japan and China should reach a settlement of their difficulties under neutral supervision. Finally, the acquiescence of the League powers in China's surrender demonstrated that China could hope for no outside assistance against further Japanese aggression.

The Tangku truce, in effect, marked the establishment of Japanese hegemony over China and abolished the status quo in the Far East established by the Washington Conference of 1922. It was destined to have far-reaching effects upon the relations of the Great Powers. It had no less important effect upon the internal political situation in China. The defense of Jehol had devolved mainly upon Marshal Chang Hsiao-liang (Hsüeh-liang), the Manchurian war lord who ruled North China from Peiping, and his ally Gen. Chiang Kai-shek, actual head of the Nationalist government at Nanking. The Nanking government took only a perfunctory part in the defense of the menaced province. T. V. Soong Nanking Finance Minister, flew to Chengtu with Marshal Chang previous to the Japanese onslaught and exhorted the troops to stand firm. Marshal Chang's troops bore the brunt of the fighting, and with their crushing defeat his strength was broken. His resignation as Nanking's commander in North China was accepted

on March 10 and shortly afterward he left for an indefinite sojourn in Italy.

General Ho Ying-ching, Nanking's Minister of War, replaced Marshal Chang in Peiping, placing North China under Chiang Kai-shek's actual control for the first time since the establishment of the Nationalist government. Huang Fu, a former Foreign Minister at Nanking, was made civil head of North China. With Marshal Chang's former troops, reinforced by some contingents from Nanking, General Ho opposed a stubborn resistance to the Japanese advance south of the Great Wall. His poorly equipped troops were decimated by the well-armed Japanese, however, and to prevent the loss of Peiping and Tientsin the Nanking government capitulated and signed the Tangku truce.

Following the same course had aroused so much criticism during the Japanese attack on Shanghai in 1932, Gen. Chiang Kai-shek, commander-in-chief of the Nanking armies, rejected the popular demand that he lead the Chinese forces in North China against the invaders. He advanced the same reason as in 1932—the necessity of crushing the Communists in south central China and unifying the country before attempting to oppose the Japanese. The Nanking government had become increasingly a bourgeois régime, whose main strength came from the wealthy bankers, industrialists, and business men of Shanghai. The latter feared communism more than they did the Japanese, and the failure of four successive campaigns against the Communists filled them with alarm. General Chiang was making extensive preparations for a fifth anti-Communist campaign when the Japanese invaded North China.

REVOLT AGAINST NANKING. While the military necessity of the Tangku truce was generally recognized in China, capitulation to the Japanese was nevertheless highly unpopular. Chiang Kai-shek was bitterly attacked by the Cantonese, who maintained a semi-independent régime in South China, and by various elements throughout the country. Feng Yu-hsiang, the so-called "Christian General," seized the opportunity to emerge from his retirement at Kalgan, Inner Mongolia. Repudiating the Tangku truce, he announced that he would defend Chahar, the province adjacent to Jehol on the west, against the Japanese. Feng captured Dolon Nor, a city 200 miles north of Kalgan, from Manchoukuo forces on July 14 and defied the Nanking government, which sent an army of 60,000 men against him. He failed, however, to enlist sufficient support to establish an independent régime in North China. Threatened by Nanking and Japanese forces, Feng resigned on August 6 and in return for a handsome bribe turned over control of Chahar Province to a Nanking commander.

NEGOTIATIONS WITH JAPAN. Meanwhile the Japanese had been attempting to secure official Chinese recognition of the new state of Manchoukuo. Such recognition would nullify the policy of non-recognition adopted toward Manchoukuo by the United States and the members of the League of Nations. Foreign Minister Hirota of Japan announced on September 29 that his ultimate aim was "to establish an Asiatic union comprising China, Japan, and Manchoukuo, pledging, through a definite protocol, close economic and political collaboration." Throughout the summer and early autumn the Japanese brought pressure to bear at Nanking, Shanghai, and Peiping for

the reestablishment of postal and railway service between China and Manchoukuo and the opening of customs offices along the Great Wall. China's acceptance would have constituted *de facto* recognition of Manchoukuo. The negotiations were carried on chiefly in Peiping between the Japanese Minister to China and the Peiping Political Council under Huang Fu.

Acceptance of these demands by the Peiping Political Council, with the assent of Chiang Kai-shek, was apparently postponed early in November because of the opposition of other members of the Kuomintang Central Executive Committee at Nanking. On October 29 the split among the Nationalist leaders on the policy to be pursued toward Japan resulted in the resignation of Finance Minister T. V. Soong, long a leading ally of Chiang Kai-shek. Soong had strongly urged resistance to Japan. During the summer of 1933, as head of the Chinese delegation to the World Economic Conference, he secured a \$50,000,000 cotton and wheat credit from the United States and arranged for the appointment of League of Nations experts to assist in the economic rehabilitation of China. On his return he announced plans for an increase in Chinese customs duties. All these activities earned Soong the enmity of the Japanese, who sought to eliminate the influence of the League and of the Western powers in China. Following his resignation, the Japanese demanded a reduction in Chinese tariffs, and the complete suppression of the anti-Japanese boycott.

THE FUKIEN REVOLT. Soong's resignation strengthened the belief of many Chinese that Chiang Kai-shek had reached a secret understanding with Japan, whereby he was to receive Japanese support against the Communists and other hostile factions in return for compliance with their demands. This conviction was reported to be a leading cause of the revolt of the Nineteenth Route Army against Nanking toward the end of November. The Nineteenth Route Army, composed largely of Cantonese and headed by Gen. Tsai Ting-kai, put up the heroic resistance against the Japanese at Shanghai which surprised the world. Since the Shanghai armistice of May, 1932, it had been engaged almost continuously in fighting the Communists in Fukien Province. Hostile to Nanking's policy of temporizing with Japan while waging a war of extermination against the Communists, the Nineteenth Route Army made peace with the Communists and launched a movement to unseat Chiang Kai-shek.

With the aid of Eugene Chen, former Chinese Foreign Minister, and other Left-wing members of the Kuomintang, a revolutionary government was established in Fukien Province. Its programme was more nationalistic and more socialistic than Nanking's. It called for complete tariff autonomy for China, for a struggle to the end against Japan, and for immediate abolition of the unequal treaties. While promising liberty of speech and assembly, it advocated state control of national resources, abolition of land titles and taxes, and redistribution of the land among the peasants.

General Chiang, who had mobilized 300,000 men for a final blow at the Communists, interrupted this campaign to put down the Fukien revolt. Contrary to expectations, the Fukien government failed to win over the semi-independent Cantonese government and other anti-Nanking

factions. It suffered a series of military defeats and at the end of the year appeared ready to collapse. Meanwhile the political effect of the Fukien revolt forced the Nanking government to reject Japanese demands for the time being.

OTHER CIVIL WARS. Besides these major disturbances, China was afflicted with the usual quota of struggles between minor war lords for control of certain provinces. Civil wars of no particular significance continued throughout most of the year in Szechwan and Kweichow Provinces. Foreign Minister Lo Wen-kan, returning in November from an inspection of distant Sinkiang Province, reported it ravaged and oppressed by contending war lords and bandits. At the end of the year, outbreak of another civil war in Tsinghai Province, in Northwest China, was reported. Heavy fighting between the Communists and Nanking troops continued to the end of the year. On October 29, the Mongol princes of Inner Mongolia established a semi-independent government in Suiyuan Province. Sections of China adjacent to Tibet were reported to have come under the control of invading Tibetan forces.

OTHER DEVELOPMENTS. The floods which devastated China during the summer of 1931 were repeated, although on a somewhat smaller scale, in 1933. Floods along the Yellow River in August drove 3,000,000 persons from their homes in Honan and Western Shantung and caused damage estimated at \$30,000,000. The collapse of farm prices and the heavy taxation for military expenditures reduced the masses to a state of desperation, which offered fertile ground for the spread of communism. In contrast with these discouraging factors was the rapid modernization of China in areas under the control of the Canton and Nanking governments. In South China, especially, many cities broadened their streets, constructed modern buildings, built water works, sewage systems, and municipal lighting plants. Construction of motor highways was widespread. In the Yangtze Valley great progress was reported in the construction of roads and other communication facilities. The League of Nations assisted in this work by sending to China 12 technical experts to advise the government in as many different fields. The Chinese interest in modernization of the country both from a military and civil standpoint was illustrated by the purchase during 1933 of some 200 airplanes in the United States alone. In December it was announced that the Curtiss-Wright Aircraft Corp. of the United States had arranged with the Nanking government to erect a \$5,000,000 airplane factory at Hangchow.

On Oct. 6, 1933, the Nanking government published its proposals for a new Constitution to be adopted in 1934, whereupon the "period of tutelage" through which Nanking was supposed to be guiding the country would come to an end and a constitutional régime inaugurated. The proposals called for the election for a six-year term of a President and Vice President, both ineligible for reelection. The candidate receiving the greatest number of votes was to be President and his nearest competitor Vice President. In addition to the five Yuans already established, the proposals called for a National Affairs Court to interpret the Constitution, and a National Congress. The constitutional proposals were subject to three formal revisions before going into effect.

CHRISTIAN CHURCH. See **CONGREGATIONAL AND CHRISTIAN CHURCHES**, and articles on various religions.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. An organization founded in Portland, Me., in 1881 by the Rev. Francis E. Clark, D.D., a Congregational minister, for the purpose of pledging young people to certain forms of Christian devotion, expression, and service. In 1933 it consisted of 58,000 societies in the United States and Canada, with a membership of more than 2,500,000. Throughout the world there were in the same year approximately 80,000 societies, with a membership of more than 4,000,000, in 105 countries, dominions, and island groups, representing more than 80 evangelical and reformed denominations. These societies were united into national unions which, in turn, composed the World's Christian Endeavor Union. For the activities of this society consult **THE NEW INTERNATIONAL YEAR BOOK** for 1932.

At the biennial convention of the International Society of Christian Endeavor, held in Milwaukee, Wis., July 8-13, 1933, the Rev. Daniel A. Poling, D.D., LL.D., was reelected president and the Rev. William Hiram Foulkes, D.D., and the Rev. Howard B. Grose, D.D., vice-presidents. The official magazine is the *Christian Endeavor World* (monthly). Headquarters are in the World's Christian Endeavor Building, Mt. Vernon and Joy Streets, Boston, Mass.; Carlton M. Sherwood, general secretary.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1866 and set forth in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs. Eddy in Boston in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston but called more frequently by its adherents "The Mother Church."

The total number of recognized branches of The Mother Church reported for the fiscal year ending May 31, 1933, was 2639, of which 47 were college and university organizations. During the year 72 churches and societies were recognized as branches, 42 being in North America, 21 in Europe, 5 in Australasia, 2 in South America, and 2 in Africa. In 1933 there were more than 10,000 advertised practitioners of Christian Science in the United States and other countries, devoting their entire time to healing the sick through prayer.

The affairs of The Mother Church are administered by a board of directors, which supervises the work of the board of education, board of lectureship, and committee on publication. The board

of education instructs and authorizes students to teach Christian Science. The board of lectureship consists of 23 members who are engaged in delivering free lectures on Christian Science throughout the world; during 1933 they delivered 3080 lectures, of which 2664 were in the United States, Canada, and Alaska and 416 in foreign fields. The committee on publication aims to correct impositions on the public in regard to Christian Science and endeavors also to guard the rights of Christian Scientists against restriction by public authority.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the *Manual* of the church, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include the *Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of the *Herald of Christian Science* in the German, French, Dutch, and Scandinavian (Danish, Swedish, and Norwegian) languages, each with the English translation opposite, and in braille.

The benevolent association of the church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home at Concord, N. H., is a home for Christian Scientists of advanced years. The Hon. Ralph O. Brewster was president of The Mother Church for the year ending May 31, 1933. Headquarters are at 107 Falmouth Street, Boston, Mass.

CHRISTMAS ISLAND. The name applied to two separate islands: (1) An island in the Indian Ocean forming a part of the Straits Settlements (q.v.). (2) An atoll in the Pacific (about 2° N. and 157° W.), over 100 miles in circumference, included in the (British) Gilbert and Ellice Islands Colony.

CHRONOLOGY. The following chronology lists the more important happenings of the year 1933 according to the dates of occurrence. In most cases these are treated in more detail under their respective headings. To such articles, particularly those on leading countries and states, such as UNITED STATES, GREAT BRITAIN, and NEW YORK, the reader is referred for additional information. For a list of prominent persons who died during the year, reference should be made to the article NECROLOGY and the important obituary notices there listed.

January 1—The Soviet Union's first Five-Year Plan ended in four years and three months.

President Hoover's Research Committee on Social Trends submitted its exhaustive report.

2—The United States completed the evacuation of its marines from Nicaragua.

In Chile, the Cosach nitrate combination was ordered dissolved by President Alessandri.

3—The Japanese captured Shanhaikwan, strategic Chinese city near the Great Wall.

The Irish Free State Dáil was unexpectedly dissolved by President de Valera.

4—The new 41,000-ton French liner *L'Atlantique*, with only the crew aboard, burned off the Channel Islands; 17 lives were lost.

5—Ex-President Calvin Coolidge died at Northampton, Mass.

The U. S. House of Representatives passed the "Jones Parity Plan" for agricultural bonuses.

8—A wave of Communist riots in Spain was crushed by the government.

11—The programme for the Soviet Union's second Five-Year Plan was announced.

18—A daughter was born to King Boris and Queen Joanna of Bulgaria. Her baptism in the Orthodox faith on January 15 was protested by the Pope.

16—Electrification of the Pennsylvania Railroad between New York and Philadelphia was completed.

17—The Yugoslav Government announced a three-

year moratorium on all payments to foreign owners of its bonds.

The U. S. Senate passed the Philippine Independence Bill.

President Hoover sent an emergency budget message to Congress.

19—Democrats in the U. S. House defeated Mr. Hoover's governmental reorganization measure.

20—Rumania accepted League supervision of its finances.

23—The Disarmament Conference reconvened at Geneva.

The Guatemalan-Honduran boundary dispute was settled by decision of an arbitral tribunal headed by Chief Justice Charles Evans Hughes.

Missouri was the 36th State to ratify the Twentieth Amendment, putting the measure into effect.

Italy announced plans for industrial reconstruction.

24—President de Valera's adherents won a decisive victory in the elections to the Free State parliament.

25—Communist demonstrations in German cities were broken up by police after severe rioting.

The U. S. Senate passed the Glass Bill regulating Federal Reserve Banks.

Secretary of State Stimson warned Peru that it would violate the Kellogg-Briand Pact by giving armed support to the illegal occupation of Leticia.

28—The Yugoslav Government banished various Opposition leaders to isolated parts of the country.

The von Schleicher Ministry resigned in Germany when President von Hindenburg refused to dissolve the Reichstag.

The U. S. House reduced the Federal prohibition-enforcement appropriation.

30—Adolf Hitler became Chancellor of Germany.

Leading American insurance companies announced a respite in farm mortgage foreclosures.

The House extended the Glass-Steagall Credit Expansion Act to Mar. 3, 1934.

31—Denmark's Socialist government made all strikes and lockouts illegal for one year.

February 1—Edouard Daladier succeeded Joseph Paul-Boncour as Premier of France.

1-2—The Argentine and Chilean Foreign Ministers met at Mendoza, Argentina, and agreed to undertake mediation of the Chaco dispute in collaboration with Brazil and Peru.

2—The U. S. House approved a \$966,838,634 bill for the Veterans' Administration.

Gen. Augusto Sandino met President Sacasa of Nicaragua in Managua and agreed to lay down his arms.

Gen. Tiburcio Carías succeeded Vicente Mejía Colindres as President of Honduras.

4—Louisiana decreed a bank holiday.

East Indian sailors on the Dutch warship *De Zeven Provinciën* seized control and put to sea; pursued by other Dutch war vessels they were forced to surrender on February 10.

6—The Prussian Diet and Cabinet were ousted by decree of the Hitler Government and new elections were called for March 5.

7—The U. S. Senate gave the President drastic powers to reorganize the government.

8—British airmen, Gayford and Nichollette, ended a 5841-mile non-stop flight from Cranwell, England, to Walvis Bay, Southwest Africa, in 57 hours 25 minutes.

10—The Little Entente states formed a closer economic and political union to resist treaty revision.

11—Britain and France protested to Austria against the shipment of arms from Italy to Hungary via Austria.

The Hungarian "standstill agreement" was extended.

12—In Germany, 12 people were killed and 27 wounded in Nazi-Communist fights.

14—Michigan declared an eight-day bank holiday.

15—Ratifications of the Franco-Soviet non-aggression pact were exchanged in Moscow.

Giuseppe Zangara, a bricklayer of Paterson, N. J., fired six shots at close range at President-Elect Franklin D. Roosevelt at Miami, Fla. Mr. Roosevelt escaped injury, but Mayor Anton Cermak of Chicago, who was standing near him, was fatally wounded and died on March 6. Four other bystanders were wounded. Zangara was executed March 20 at Raiford, Fla.

16—A Senate resolution, adopted 63 to 23, formulated the Twenty-first (prohibition repeal) Amendment to the U. S. Constitution.

17—The League of Nations broadcast by wireless its report condemning the Japanese occupation of Manchuria.

The "standstill agreement" between German bankers and their foreign creditors was extended to Feb. 28, 1934.

18—Colombia invoked Article XV of the League Covenant, asking League intervention in the quarrel with Peru over Leticia.

19—The Japanese commenced their invasion of Jehol Province.

20—The House passed the Senate prohibition repeal resolution, 289 to 121.

21—Several clashes between President Machado's troops and insurgent bands occurred in the Cuban provinces.

22—Michigan banks reopened under restrictions; in Detroit depositors were allowed to withdraw only 5 per cent of their deposits.

Indiana declared a bank holiday; in the next three days Maryland, Arkansas and Ohio followed suit.

24—The League of Nations Assembly adopted a report blaming Japan for the Manchurian crisis; the Japanese delegates left the League chamber.

Judge Harold Louderback of California was impeached by the U. S. House of Representatives, 183 to 142.

25—The Couzens banking bill was signed by President Hoover.

27—Charles E. Mitchell resigned as chairman of the National City Bank of New York City.

Great Britain placed an embargo on exports of arms to China and Japan. The embargo was lifted March 13 when no other nation followed suit.

A fire of mysterious origin destroyed the Reichstag building in Berlin.

March 2—Henry Thomas Rainey won the Democratic contest for the Speakership of the next U. S. House.

Senator Thomas J. Walsh of Montana, named Attorney General in President Roosevelt's Cabinet, died suddenly while on his honeymoon.

3—Debtors secured relief with the signing of the LaGuardia-McKeon bill by President Hoover.

Northern Japan was devastated by an earthquake and tidal waves, which killed 2500.

4—Franklin Delano Roosevelt and John Nance Garner were inaugurated President and Vice President of the United States, respectively.

President Hoover's "pocket veto" killed the \$1,000,092,195 Independent Offices Appropriation Bill.

5—President Roosevelt called the 73rd Congress in special session for March 9. Banks of the nation were ordered closed from March 6 to March 9 or later.

After outlawing the Communists, Hitler's National Socialists won a majority in the Reichstag.

The Royalists under Tsaldaris won the Greek elections and General Plastiras made an abortive attempt to establish a dictatorship.

Japanese troops captured Jehol City, capital of Jehol Province, which was subsequently incorporated in Manchoukuo.

7—The granting of loans on policies was ended by New York life insurance companies.

9—President Roosevelt extended the bank moratorium pending further notice.

The 73rd Congress convened in special session in Washington, and passed immediately the President's emergency banking measure.

10—Severe earthquakes wrecked Long Beach and other Southern California towns, killing 120 and causing damage of more than \$40,000,000.

The President urged the U. S. Congress to balance the budget as the first step toward national recovery.

12—Mr. Roosevelt made the first of his popular radio addresses on national affairs.

The Soviet Government executed 35, including several high officials, for opposing its efforts to collectivize agriculture.

13—The President urged Congress to modify the Volstead Act and raise revenues from light wines and beers.

The national banking holiday ended with the reopening of solvent Federal Reserve Banks.

14—Six British engineers employed by the Metropolitan-Vickers Co. in the Soviet Union were arrested by the Soviet Government for alleged sabotage.

15—Most of the stock and commodity exchanges in the United States reopened.

16—Prime Minister MacDonald of Great Britain placed a new arms limitation proposal before the Disarmament Conference.

18—The League of Nations Council decided that Peru was unjustified in supporting the occupation of the Colombian town of Leticia by private Peruvian citizens. Scheme for a new Federal constitution for India was published by the British Government.

19—A new Portuguese constitution was approved at a national election.

20—Mussolini, with Prime Minister MacDonald's approval, issued his project for a Four-Power pact to secure peaceful revision of the peace treaties.

The Economy Bill, signed by the President, lopped \$500,000,000 from civil service salaries, veterans' compensation, and pensions.

21—The U. S. House passed a Senate bill restricting interstate traffic in 8.2 beer.

22—The Cullen Bill, permitting sale of 8.2 beer and wine, was signed by President Roosevelt.

The U. S. House authorized the Secretary of Agriculture to cut production and supervise transactions in nine farm products.

23—The German Reichstag gave Hitler dictatorial powers for four years and adjourned *sine die*.

24—The National Bank of Detroit was established,

with half of its capital subscribed by the Reconstruction Finance Corporation.

27—Japan announced her withdrawal from the League of Nations.

Farm credit agencies and the Federal Farm Board were merged at Washington in a new Federal Credit Administration, headed by Henry Morgenthau, Jr.

American Jews held protest meetings in New York, Chicago, Boston, and other cities against anti-Semitism in Nazi Germany.

28—One million U. S. government employees received pay cuts.

29—Another Presidential message to the U. S. Congress urged legislation to protect investors.

30—Premier J. B. M. Hertzog formed a new Ministry in South Africa.

31—Legislation was signed by Mr. Roosevelt authorizing the establishment of the Civilian Conservation Corps.

President Terra of Uruguay dissolved Congress and established a dictatorship.

April 1—The President's order reduced U. S. pension payments by \$400,000,000.

The Nazi Government in Germany inaugurated its anti-Semitic campaign.

2—The conservatives regained control of the government of Siam, only to be ousted on June 21 by the progressive group which seized control first in 1932.

3—The President submitted his farm mortgage relief programme to the U. S. Congress.

Mount Everest, world's highest peak, was viewed from above for the first time when two British airplanes flew over the summit.

The first State to ratify the Twenty-first Amendment was Michigan.

4—The *Akron*, prize airship of the U. S. Navy, carried 73 men, including Rear Admiral Wm A. Moffett, to their deaths in the Atlantic Ocean.

5—The Eastern European states held an agricultural conference in Bucharest, Rumania.

A Presidential order required gold hoarders to return their gold to Federal Reserve Banks.

The World Court decided the Danish-Norwegian controversy over East Greenland in favor of Denmark.

6—The U. S. Senate approved the Black Thirty-Hour Week bill, 53 to 30.

7—Lieut. Norman Baillie-Stewart was sentenced to five years' imprisonment by a British court martial for selling military secrets to Germany.

8—Western Australia voted to secede from the Australian Commonwealth, but actual secession did not occur.

Enlistment of recruits for the Civilian Conservation Corps commenced in the United States.

9—At Athens, Ga., Circuit Judge J. E. Horton set aside the conviction of Haywood Patterson, Negro defendant in the Scottsboro case, as contrary to the evidence.

10—Mr. Roosevelt announced that 11 nations would send representatives to Washington to discuss plans for economic revival.

11—George Bernard Shaw stopped off at New York City on a round-the-world tour to make a speech at the Metropolitan Opera House.

12—The President's home mortgage relief plan was submitted to the U. S. House.

13—Assassinations and terrorism in Havana, Cuba, cost the lives of six students.

14—The British Government barred imports from the Soviet Union in retaliation for the imprisonment of British engineers in Moscow on sabotage charges.

The United States abandoned the gold standard.

20—The U. S. Senate received the Administration bill for controlled inflation.

The U. S. Senate, by a vote of 64 to 20, adopted an Administration amendment to the Farm Mortgage Bill empowering the President to control inflation.

21—The *Macon*, U. S. N., sister airship of the *Akron*, completed its first trial flight.

23—Conservatism won victory in the Spanish municipal elections.

24—An Anglo-Danish Trade agreement was signed.

26—Prime Minister MacDonald of Great Britain sailed from New York after conferring with President Roosevelt on economic policies.

27—For his refusal to agree to sign no more farm mortgage foreclosures, District Judge Charles O. Bradley was dragged from his courtroom at La Mars, Iowa, and mistreated by a crowd of farmers.

28—Terms of the new Persian concession to the Anglo-Persian Oil Company were agreed upon.

President Alessandri received dictatorial powers from the Chilean Congress.

30—President Sánchez Cerro of Peru was assassinated.

May 1—An Anglo-Argentine commercial and financial agreement was signed in London.

Opening of canal sluices at the Dnieprostroy dam in the Soviet Union made the Dnieper River navigable for 1000 miles.

Compulsory manual labor for every German youth was decreed by Chancellor Hitler.

8—Japan informed the United States that the "open door" would be observed by Manchoukuo.

The Irish Free State Dáil repassed the bill eliminating the oath of allegiance to the King of England.

4—A Senate amendment to the Reconstruction Finance Corporation Act of 1932 prohibited loans to corporations any of whose paid officials or employees received more than \$17,500 a year.

A Federal coordinator of transportation was called for under the Emergency Relief (railway) Bill sent to Congress by President Roosevelt.

6—A new Soviet-Italian customs convention and credit agreement was signed in Rome.

7—President Roosevelt, in a radio broadcast, outlined his plans for raising commodity prices.

8—Mahatma Gandhi was released from jail at Poona, India, following the suspension of his civil disobedience campaign.

Ignacy Moscicki was reelected President of Poland.

10—Books by Jewish and non-German authors were burned in many German cities.

Austria suspended payments to the Bank for International Settlements on the League of Nations loan.

The Paraguayan Government declared that a state of war existed with Bolivia.

12—The United States and seven other powers agreed on a tariff truce until the end of the World Economic Conference.

A general strike voted by the (American) National Farmers' Holiday Association was postponed due to the prospect of relief legislation.

President Roosevelt signed the State Relief Bill, appropriating \$500,000,000 for distribution to the States by a Federal Relief Administrator.

13—A milk strike went into effect in 19 of Wisconsin's 71 counties.

16—An international crisis in Europe produced Mr. Roosevelt's dramatic peace plea to the heads of 54 nations.

The Republic of Panama defaulted on \$11,000,000 of its 5 per cent bonds held in New York.

17—In Spain, the Cortes voted to nationalize Catholic Church property worth \$500,000,000 and to abolish religious schools.

Chancellor Hitler summoned the Reichstag in emergency session to hear his defense of Germany's foreign policies.

Premier J. B. M. Hertzog's Nationalist party was returned to power in the South African elections.

18—The Muscle Shoals Bill, authorizing public development of the Tennessee River Valley, was signed by the President.

20—An Anglo-Norwegian trade agreement was signed.

23—Federal Reserve banks commenced open market purchases of \$25,000,000 worth of government securities in order to release cash for business purposes.

J. P. Morgan testified before the U. S. Senate Committee on Banking and Currency that his firm paid no income tax in 1931 and 1932.

24—The U. S. Senate, after hearing impeachment proceedings against Federal Judge Harold Louderback, acquitted him of charges of irregularities in receiverships.

26—Peru agreed to evacuate Leticia and place the disputed territory under a League commission pending final settlement with Colombia.

27—President Roosevelt signed the Securities Bill. Postmaster General Farley opened the Chicago Century of Progress Exposition.

28—The Nazis won control of the Free City of Danzig in the Diet elections.

29—Mahatma Gandhi ended his three-weeks fast of "purification."

31—A truce signed at Tangku, China, terminated fighting between Chinese and Japanese forces near Peking.

June 1—The Hitler Government announced a "four-year plan" for national recovery.

Soviet Russia opened at Cheliabinsk in the Ural Mountains the biggest tractor plant in the world.

5—Abrogation of the gold clause in U. S. monetary obligations was effected by joint Congressional resolution, signed by the President.

6—An unsuccessful attempt was made to assassinate ex-Premier Venizelos of Greece.

The League Council ruled that anti-Semitic measures adopted in German Upper Silesia violated Germany's pledges under the minorities convention.

President Roosevelt signed a bill to coordinate interstate employment.

7—The Four-Power pact between Germany, France, Great Britain, and Italy was signed in Rome.

9—A moratorium on German external indebtedness was officially announced as from July 1.

11—The Spanish aviators, Barberan and Collar, landed at Camagüey, Cuba, after a 4375-mile flight from Seville, Spain. They were lost June 20 on a flight from Havana to Mexico, D. F.

12—The World Economic Conference convened at London, recessing indefinitely on July 27.

13—Both Houses of the U. S. Congress approved conference reports on the Glass-Steagall Banking Reform Bill and on the Industrial Recovery Bill.

15—Of war-debt installments totaling \$143,604,856 due the U. S. Treasury, only 8 per cent was received.

16—President Roosevelt declared the NRA envisaged permanent stabilization and the preservation of American standards.

The special session of the 73rd Congress ended at Washington.

18—Chancellor Dollfuss of Austria took drastic measures to curb the Nazi agitation for the incorporation of Austria in Germany.

21—Reemployment of 1,500,000 of its members since April 1 was announced by the American Federation of Labor.

22—Hitler ordered the dissolution of the powerful German Social Democratic party.

The Illinois ship canal, linking the Great Lakes and the Gulf of Mexico, was officially opened by Secretary of War Dern.

24—Conflict between Hitler's Government and the German Protestant Churches opened with the resignation of Reichsbishop Friedrich von Bodelschwingh.

26—Representatives of Japan, Manchoukuo and the Soviet Union met in Tokyo to discuss the sale of the Russian interest in the Chinese Eastern Railway.

27—The Washington Commission of Neutrals announced the end of its efforts to settle the Chaco dispute.

29—Primo Carnera won the world's heavyweight championship by knocking out Jack Sharkey in the 6th round.

30—Joseph Avenol of France succeeded Sir Eric Drummond as Secretary General of the League of Nations.

The United States fiscal year closed with a deficit of \$1,786,000,000.

July 1—Diplomatic relations between Britain and the Soviet Union, broken off in April, were resumed.

2—The RFC announced a \$4,000,000 credit to American exporters to permit the disposal of 75,000 bales of cotton in the Soviet Union.

3—The President's message to the World Economic Conference ended hopes for a currency stabilization agreement among the powers.

The "gold bloc" at the World Economic Conference signed a declaration of adherence to the gold standard.

A pact repudiating and defining aggression was signed at London by Maxim Litvinov for the Soviet Union with representatives of seven neighboring countries.

4—A second convention defining aggression was signed in London by the Soviet Union, Turkey, and the countries of the Little Entente.

Dissolution of the Catholic Centre, the Bavarian People's, the Populist, and Young German parties was announced at Berlin.

6—With the release of the two British engineers imprisoned in the Soviet Union the British embargo on Soviet goods was removed.

8—A concordat was signed in Rome between the Third Reich and the Vatican.

9—The cotton textile code, the first under the NRA, was approved.

11—President Roosevelt established a super-Cabinet, known as the Executive's Cabinet Advisory Board.

12—President Roosevelt ordered all postmasters placed under Civil Service rules.

14—A Federal processing tax of 4.2 cents a pound was placed on cotton in the United States.

20—The NRA blanket-code, shortening hours and raising wages, was decreed by President Roosevelt.

21—The Disarmament Conference adjourned until October 16.

Trading on the N. Y. Stock Exchange aggregated 9,573,000 shares, the heaviest since Oct. 30, 1929.

22—An agreement regulating the production and marketing of silver was signed at the London Economic Conference by eight countries, including the United States.

Wiley Post completed the first solo flight around the world in 7 days 19 hours, landing at New York.

25—The Republican government in Spain crushed a rising by Communists and Conservatives.

26—The largest dry dock in the world was opened at Southampton, England, by King George.

27—The death sentence was imposed upon Walter H. McGee in Kansas City for kidnaping Mary McElroy.

The World Economic Conference recessed indefinitely.

29—Governor Pinchot called out the National Guard to prevent further violence in the Fayette Co., Pa., coal strike.

August 1—Mahatma Gandhi was rearrested for resuming his civil disobedience campaign.

The "blue eagle" emblem of the NRA made its official appearance throughout the United States.

2—Speculation on the New York Stock Exchange was discouraged by the raising of margin requirements.

The Baltic-White Sea Canal in the Soviet Union was officially opened.

3—The U. S. Navy Department awarded contracts for the construction of 21 ships, to cost more than \$130,000,000.

4—Britain and France protested to the Hitler Government against its propaganda in Austria.

5—Polish and Danzig authorities signed an agreement regulating use of the port of Danzig and Polish rights in Danzig.

7—Havana crowds, celebrating a false report that President Machado had resigned, were fired on by troops, 40 being killed.

Rossi and Codos, French flyers, established a distance record of 5657.387 miles from Brooklyn, N. Y., to Rayack, Syria.

Withdrawal of U. S. Marines from Haiti by Oct. 1, 1934, and a new financial setup were arranged for in a United States-Haiti pact signed at Port-au-Prince.

12—President de Valera invoked the Public Safety Act against Gen. Owen O'Duffy's Fascist "Blue Shirts."

President Machado was forced to flee Cuba due to disaffection in the Army. Carlos Manuel de Cespedes became Provisional President.

Gen. Italo Balbo landed his fleet of 23 hydroplanes near Rome on the return voyage from the Chicago Exposition.

15—Constitutionality of the National Industrial Recovery Act insofar as it applied to restriction of oil production was upheld by Justice Joseph Cox of the District of Columbia Supreme Court.

16—A new Atlantic speed record of 4 days and 14 hours from Gibraltar to New York was set by the Italian liner *Rex*.

17—Floods along the Yellow River had driven more than 1,500,000 Chinese from their homes.

18—Government purchases of pork products for distribution to relief agencies was announced as a move to aid hog raisers.

19—The oil, steel, and lumber NRA codes were signed by President Roosevelt.

20—Mussolini announced a severe shakeup in his Cabinet.

24—The 1933 cotton crop of the U. S. had been reduced by 4,000,000 bales through the plowing under of 10,000,000 acres of cotton.

25—International agreement for reduction of wheat acreage was reached at London.

27—Prof. Raymond Moley, once a leading member of President Roosevelt's "brains trust," resigned as Assistant Secretary of State.

An NRA code regulating the U. S. automobile industry was signed.

30—The biennial Congress of the National Socialist party was held at Nuremberg, Germany.

September 1—A storm in Cuba killed more than 100 and made 100,000 homeless.

2—A Soviet-Italian non-aggression pact was signed in Rome.

The powers authorized Austria to increase her army from 8000 to 30,000 men as a protection against Nazi agitation.

Secretary of the Interior Ickes restricted production of United States oil fields to 2,409,700 barrels daily.

4—The de Cespedes régime in Cuba was overthrown.

6—Opponents of President de Valera in the Irish Free State formed a United Ireland party, led by General O'Duffy.

8—King Feisal of Iraq died at Berne, Switzerland.

10—Dr. Ramon Grau San Martin was named Provisional President of Cuba by a revolutionary junta.

King Albert of Belgium formally opened the new vehicle and pedestrian tunnels under the Scheldt River at Antwerp.

14—Greek and Turkish officials signed a 10-year pact of non-aggression at Ankara, Turkey.

18—The American bituminous coal industry came under an NRA code.

A Japanese army court-martial sentenced 11 army cadets to prison for the assassination of Premier Inukai in May, 1932.

Contracts to reduce their wheat acreage by 15 per cent had been signed by the Agricultural Adjustment Administration with 219,818 growers controlling 21,000,000 acres.

20—Chancellor Dollfuss tightened his dictatorship in Austria by assuming five portfolios in the reorganized Cabinet.

21—The Agricultural Adjustment Administration was instructed to purchase food and clothing for 3,500,000 families on relief rolls in the United States.

The Polish balloonists Hynek and Burzynsky traveled 846 miles to win the international balloon race for the Gordon Bennett Trophy.

24—Abdel Fattah Zehia Pasha replaced Sidky Pasha as Premier of Egypt.

25—Col. Roscoe Turner flew from Los Angeles to New York in 10 hours 5 minutes 30 seconds, setting a new trans-continental record.

The Argentine Senate voted to join the League of Nations, with a reservation against the Monroe Doctrine.

26—The United States Government rejected the British proposal for the postponement of the construction of four 10,000-ton cruisers during the period of the Disarmament Conference.

Great Britain and Argentina signed a supplementary tariff pact at Buenos Aires.

30—Three Russian balloonists ascended to 62,340 feet, the highest reached by man.

Argentina, Brazil, Chile, and Peru declined a mandate of the League of Nations to attempt settlement of the Chaco dispute.

An Oklahoma City jury convicted five kidnapers of Charles F. Urschel. Four received life sentences.

October 2—The American Federation of Labor took its stand against inflation and in favor of a six-hour day and a five-day week.

President Roosevelt, addressing the American Legion convention in Chicago, placed veterans with non-service-connected disabilities in the same category as other citizens.

Cuban army officers, besieged in the National Hotel in Havana, were forced to surrender by government forces. Casualties, 119 killed and more than 200 wounded.

5—A new German press law made every newspaperman responsible to the state for his professional activities.

6—The U. S. Government established the Community Credit Corporation to buy, sell, or lend money on commodities.

7—The New York Giants (National League) defeated the Washington Senators (American League), 4 to 3, to win the 1933 World Series.

Non-union American coal mines were placed under the collective-bargaining provisions of the coal code.

President Alcala Zamora of Spain dissolved the Cortes and named Martinez Barrios Premier in place of Manuel Azafia.

9—President Roosevelt held a White House conference with President Harmodio Arias of Panama.

10—An anti-war treaty was signed at Rio de Janeiro by six Latin American nations.

11—Switzerland doubled its military budget in fear of German aggression.

13—The American Federation of Labor voted to boycott German-made products.

14—Germany withdrew from the League and from the Disarmament Conference.

15—A Deposit Liquidation Division of the Reconstruction Finance Corporation was formed to aid depositors in closed banks.

17—With a reduction of 2,600,000 in the ranks of the unemployed in the United States they still numbered approximately 10,000,000.

Governor Langer of North Dakota declared an embargo on wheat shipments from the State.

Albert H. Wiggin, former chairman of the Chase National Bank of New York City, testified in Washington before the Senate Banking Committee.

18—The Senate of Ecuador voted to impeach President Martinez Mera. He was forced to resign his office.

20—President Roosevelt announced the opening of negotiations for a resumption of diplomatic relations with the Soviet Union.

Joseph Stalin, Soviet dictator, freed more than 12,000 political prisoners.

21—A "farm strike" was called in sections of the American Middle West.

22—Mr. Roosevelt announced his gold-buying plan as an adjunct to his price-raising policy.

24—The Daladier Ministry was defeated in the French Chamber on the budget issue and resigned.

25—The U. S. Government, through the RFC, commenced gold-buying operations.

26—Albert Sarraut organized a new French Government.

27—Arab demonstrations against Jewish immigration to Palestine resulted in clashes with troops in which 20 were killed and 130 injured.

28—T. V. Soong resigned as Finance Minister of the Nanking Government in China.

31—The Greek Supreme Court rejected the second application of the United States Government for the extradition of Samuel Insull.

November 2—The language dispute in Malta again led to the dissolution of Parliament by the British Governor.

4—The United States Government denounced its extradition treaty with Greece, owing to the refusal to extradite Samuel Insull.

6—Anglo-American negotiations for an adjustment of the British war debt were indefinitely postponed, with the understanding that Britain would make another "token payment" on December 15.

The U. S. Federal Government placed in effect a processing tax of 28 cents a bushel on wheat.

7—Fusion forces, led by Fiorello LaGuardia, overthrew the Tammany administration in New York City.

8—King Nadir Shah of Afghanistan was assassinated and was succeeded by his son, Zahir Shah.
 The Civil Works Administration, with a \$400,000,000 credit, was established to provide work for the U. S. unemployed.
 9—A revolt against the Grau San Martin government in Cuba by pro-Céspedes elements was crushed after severe fighting.
 18—A new Rumanian Cabinet was formed by I. G. Duca.
 Hitler's foreign policy was overwhelmingly approved at a special Nazi referendum.
 16—President Roosevelt announced the resumption of diplomatic relations between the United States and the Soviet Union.
 17—Henry Morgenthau, Jr., was named Acting Secretary of the Treasury.
 18—President Roosevelt assailed "modern Tories" in his address at Savannah, Ga.
 19—Elections to the Spanish Cortes showed strong Conservative gains.
 21—Newfoundland reverted from a dominion to a crown colony as a result of its financial difficulties.
 The American balloonists, Comm. T. G. W. Settle and Maj. C. L. Fordney, ascended 61,243 feet in a sealed balloon car.
 Prof. O. M. W. Sprague resigned as adviser to the U. S. Treasury.
 24—The Sarraut Cabinet fell in France on the budget issue.
 26—A San Jose, Calif., mob lynched two men who had kidnaped and murdered Brooke Hart. Approval of the lynching by Governor Rolph stirred a nation-wide controversy.
 27—Camille Chautemps (Radical Socialist) formed a new French Cabinet.
 29—A new war cabinet was formed in Bolivia by Carlos Calvo.
 December 1—A jury at Decatur, Ala., for the third time convicted Heywood Patterson, Negro defendant in the Scottsboro case, of attacking a white woman.
 2—Federal District Judge Alexander Akerman of Tampa, Fla., held the National Industrial Recovery Act unconstitutional insofar as it affected local industry.
 8—The Seventh Pan American Conference convened at Montevideo, Uruguay.
 5—Utah was the 36th State to ratify the Twenty-first Amendment to the Constitution, the Eighteenth Amendment was repealed by proclamation of President Roosevelt December 6.
 The Fascist Grand Council announced that Italy would not remain in the League of Nations, unless it was reformed.
 Mr. Roosevelt vigorously condemned "lynch law" in an address before the Federal Council of Churches.
 6—The jury in the Scottsboro, Ala., cases condemned two of the seven Negro defendants to death.
 The National Emergency Council, a new coordinating agency, was established by President Roosevelt.
 10—The Fascist Grand Council proclaimed legislation designed to reorganize Italian political and economic institutions on a corporative basis.
 12—Commander Byrd's second Antarctic expedition sailed from Dunedin, New Zealand, for the Bay of Whales.
 13—William C. Bullitt, first United States Ambassador to the Soviet Union, presented his credentials to President Kalinin.
 15—Of the \$152,952,637 war-debt instalment due the United States Government from 11 European nations, \$8,898,123 was received from six nations.
 16—Alejandro Lerroux formed a minority government in Spain.
 18—Gen. Owen O'Duffy, opponent of President de Valera of the Irish Free State, was arrested while attempting to address a political meeting.
 19—Col. and Mrs. Charles A. Lindbergh returned to New York after a 30,000-mile air tour lasting five months and 10 days.
 Great Paraguayan victories in the Chaco terminated in a truce with Bolivia.
 21—President Roosevelt announced that the government would purchase 24,421,410 ounces of domestic silver annually for four years at 64½ cents per ounce.
 23—The Reichstag fire trial ended at Leipzig with the sentencing of the Dutchman, Marinus van der Lubbe, to death and the acquittal of the four other defendants.
 A Crown Prince of Japan was born in Tokyo.
 24—A train collision at Lagny, France, caused 180 deaths.
 The French Parliament finally approved a budget bill and adjourned to Jan. 9, 1934.
 26—The Pan American Conference at Montevideo ended its sessions in unexpected harmony.
 27—The U. S. Government sued the New York Clearing House for the sum of the 11,000 deposits tied up in the bankrupt Harriman National Bank and Trust company.

28—The Argentine Government declared a state of siege after uprisings in four provinces.
 29—A member of the outlawed anti-Semitic Iron Guard assassinated Premier Ion G. Duca of Rumania.
 30—Tammany ended its 16-year rule of New York City.
 31—The NRA reported that 4,000,000 workers had been rehired by American industry.

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS. See LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF.

CINCINNATI, UNIVERSITY OF. An institution for the higher education of men and women in Cincinnati, O., founded in 1870. The registration in the autumn of 1933 was 8617. The summer-school enrollment for 1933 was 648. There were 546 members on the faculty. The endowment funds of the university for the year ended Dec. 31, 1932, amounted to \$9,162,586; the income for the same period was \$2,161,665. The library contained 330,097 volumes. President, Raymond Walters, A.M., LL.D.

CITY AND REGIONAL PLANNING. With the exception of Idaho, Montana, and South Dakota, every State in the Union had one or more official municipal planning commissions on Jan. 1, 1933, according to a bulletin issued by the Division of the Building and Housing of the U. S. Bureau of Standards. The total number of commissions, including one in the District of Columbia, was 806, a net loss of 22 during 1932, for although 45 new commissions were formed 67 went out of existence. Massachusetts led the list with 119 commissions. New York almost tied with 118. California had an even 100; Ohio, 79; Pennsylvania, 52; Illinois, 41. Compared with the 16,598 incorporated places in the United States, the 806 municipalities having commissions are small, but, as will be seen by the accompanying table, the larger municipalities and by far the

NUMBER AND POPULATION OF PLACES IN THE UNITED STATES HAVING OFFICIAL PLANNING COMMISSIONS

Population Group	NO. OF PLACES		
	Total	With commissions	Per cent
Over 100,000	93	81	87
25,000 to 100,000	283	162	57
10,000 to 25,000	606	208	33
5,000 to 10,000	851	185	16
Under 5,000	14,765	220	1
Total	16,598	806	5

Population Group	POP. TO NEAREST THOUSAND		
	Total	With commissions	Per cent
Over 100,000	36,326,000	27,470,000	82
25,000 to 100,000	12,917,000	7,845,000	67
10,000 to 25,000	9,097,000	3,297,000	36
5,000 to 10,000	5,897,000	987,000	17
Under 5,000	13,901,000	561,000	4
Total	78,188,000	40,160,000	51

greatest part of the population are provided with official planning authorities. In addition, 35 places have unofficial commissions. Although city planning itself entails little cash outlay, so straitened financially have been many cities of late that even the small expenditures for planning work have been curtailed. The Federal report cited states that in at least 12 cities of more than 25,000 population the services of important planning engineers or other officials have been dispensed with while in some cases the office staff

has been reduced. Over 100 planning boards, of which about 50 serve the larger cities of the country, reported that their functions had been curtailed in the last two years on account of the depression, but some 300 reported little or no change in this respect.

REGIONAL PLANNING. Besides the 806 municipal planning commissions, there were on Jan. 1, 1933, 59 official regional planning commissions, of which 46 were county organizations. Twenty States were represented. Of these, California had 26 regional commissions, of which 25 represented counties. New York had 12; Illinois, 6; New Jersey, and Pennsylvania, 5 each.

England and Wales had 120 regional planning areas for which joint committees were formed; 48 of the 120 committees had "executive power." For a list and sketch may see *Town and Country Planning* (London), August, 1933.

ZONING. The number of zoned areas—counties, cities, towns, townships, and unincorporated areas—totaled 1236 on Jan. 1, 1933, against 806 municipal and 59 regional official planning bodies. The population in zoned areas was 48,400,000, not including some areas for which the population was not available. Every State has zoned areas. By population groups the division was: over 100,000, 83 (out of 93); 10,000 to 100,000, 470; 1000 to 10,000, 563; under 1000, 93; unclassified, 19. Counties which have adopted zoning number 8. By States, New York leads with 215 zoned municipalities. Next come New Jersey with 132; California, 113; Illinois, 93. The U. S. Bureau of Standards, from whose bulletin these figures have been taken, has for several years past issued a yearly bulletin of State enabling legislation on zoning and of local zoning ordinances.

Progress on the *Civico Centre* for St. Paul, Minn., including a new city hall, court house, and Federal building and an esplanade along the Mississippi River, was described and illustrated in *Engineering News-Record* (New York) Mar. 30, 1933. Among articles on specific planning work in *City Planning* (Boston) during the year were: "A New Plan for Historic Alexandria, Virginia," and "Planning Geneva, Switzerland," in the January and July issues. A new British journal in this field, the first issue of which appeared in November, 1932, is *Town and Country Planning* (London) published under the auspices of the Garden Cities and Town Planning Association. Other British journals are the *Town Planning Review* (Liverpool) and the *Journal of the Town Planning Institute* (London) a monthly which details action under the Town and Country Planning Act, 1932, and reports the papers and discussions before the Institute. In America, the annual *Proceedings of the National Conference on City Planning* (New York City) contains numerous papers and discussions. See also: Abercrombie, *Town and Country Planning* (New York); Black and Black, *Planning for the Small City* (Chicago); British Ministry of Health, *Town and Country Planning, England and Wales* (London); Comey, *Transition Zoning* (Cambridge, Mass.); Macfayden, *Sir Ebenezer Howard and the Town Planning Movement* (Manchester, England); Poole, *The Town and Country Planning Act, 1932, Explained* (London); Regional Plan Association, *From Plan to Reality* (New York) a review of four years' progress in carrying out elements of the Regional Plan of New York and Environs.

CITY MANAGERS. See **MUNICIPAL GOVERNMENT.**

CIVIC FEDERATION. See **NATIONAL CIVIC FEDERATION.**

CIVIL ENGINEERS, AMERICAN SOCIETY OF. An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse among men of practical science.

The membership as of Nov. 6, 1933, consisted of 18 honorary members (persons of acknowledged eminence in engineering), 5770 members (civil, military, naval, mining, mechanical, electrical, and other engineers in active practice 12 years and qualified to design as well as to direct engineering work), 6276 associate members (those who had been practicing eight years), 2903 junior members (beginners in the profession), 112 affiliate members (persons qualified to cooperate with engineers but not themselves engineers), and five fellows (contributors to the permanent funds of the society, who may not be eligible to membership). There were 56 local sections and 107 affiliated student chapters in colleges and universities throughout the United States.

Two general meetings of the society were held in 1933, the annual meeting and the annual convention. At the annual meeting, held in New York City, January 18-21, the following medals and prizes were awarded for papers published in the *Transactions*: The J. James R. Croes Medal to David L. Yarnell and Floyd A. Nagler, the Thomas Fitch Rowland Prize to Clifford Allen Betts, the James Laurie Prize to Earl I. Brown, the Arthur M. Wellington Prize to Fred Lavis, and the Collingwood Prize for Juniors to Arthur R. C. Markl. The sixty-third annual convention, held in Chicago June 27-30, devoted its general session to a symposium on the problem of tax reduction, arranged under the auspices of the engineering-economics and finance division of the society.

At each of the meetings some sessions were under the direction of one or more of the 10 technical divisions, for which papers were presented on their special branches of engineering. Eight research committees, with a total personnel of about 60, were engaged throughout the year in special investigations. Nearly 100 members served on joint boards and committees, with representatives of other societies, for research and standardization.

The society publishes two monthly magazines: *Proceedings*, containing technical papers which are later collated, with discussions, in the yearly volume of *Transactions*; and *Civil Engineering*, which presents news of society affairs and articles of more popular appeal. The *Year Book* contains a list of members and general information about the society. A series of *Manuals*, published at irregular intervals, deal with various topics of engineering interest.

The officers of the society in 1933 were: president, Alonzo J. Hammond; vice-presidents, D. C. Henny, Arthur S. Tuttle, F. O. Dufour, and Frank G. Jonah; secretary, George T. Seabury; treasurer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

CIVILIAN CONSERVATION CORPS. See **FORESTRY; MILITARY PROGRESS; UNITED STATES under Administration.**

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office, this organization has sought to accomplish its end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government officials. It also had advocated, on the principle that public office is a public trust, that those best fitted through demonstrated ability and capacity should serve the State.

During 1933 the League urged that an end be made of appointment of presidential postmasters on a political basis. It sought the competitive classification under the civil service law of employees of the new government agencies to carry out the administration's recovery programme; urged the reemployment of former federal workers, who had been laid off for reasons of economy, to fill positions in these agencies. It vigorously protested against the use of federal offices to reward unqualified party workers in the 1932 election.

The league endeavors to secure the adoption and improvement of civil service in various States and cities. Reports of its work are issued periodically. *Good Government* is the official organ. The officers in 1933 were: George McAneny, president; W. W. Montgomery, Jr., chairman of the executive committee; Howard R. Guild, chairman of the council; Ogden H. Hammond, treasurer; and H. Eliot Kaplan, secretary. Headquarters are at 521 Fifth Avenue, New York City.

CIVIL WORKS ADMINISTRATION. See PAINTING; WELFARE WORK; ARCHITECTURE.

CIVITAN INTERNATIONAL. An organization composed of selected professional and business men throughout the United States and Canada, who have dedicated themselves to unselfish service to their city, county, State, and nation. The first Civitan Club was founded in Birmingham, Ala., in 1917, the name being formed from the Latin "civitas." The organization of field work was begun in 1920, when the international association was formed in Birmingham, and by 1921, when the first annual convention was held, there were 30 clubs. A total of 278 clubs had been chartered by Nov. 1, 1933.

Among the outstanding achievements of the Civitan Clubs in 1933 were the awarding of medals to students of the Citizens' Military Training Camps who possessed outstanding attributes of citizenship. Many clubs were sponsoring the "Sunbeam and Shadow" radio programme, the plan of which originated with the Miami (Fla.) Civitan Club. It consists of broadcasting appeals of those in distress by number; these appeals are known as "shadows," while the responses for the relief of such unfortunates are known as "sunbeams." The various clubs continued also their work of curbing crime, eliminating tuberculosis and carrying out a general health programme, and eradicating communistic activities wherever found. There were the usual agencies of Big Brothers work, Boy Scout camps, parole of first offenders to Civitans for personal observation, Americanization work, city beautification, sponsoring of essay contests on "Good Citizenship," and, in general, participation in all matters of civil improvement and humanitarian betterment.

The 1933 convention was held in Memphis, Tenn., June 11-14, and the 1934 convention was

to be held in Toronto, Canada. The official organ is *The Civitan* (monthly). The officers for 1933 were: President, Maurice L. Townsend, Washington, D. C.; vice-presidents, William H. Buscombe, Toronto, Canada; C. Francis Cowdrey, Fitchburg, Mass.; Dr. J. D. Jordan, Little Rock, Ark.; and J. P. Simmons, Miami, Fla.; international secretary, Arthur Cundy, Birmingham, Ala.; and international treasurer, Everett N. Brown, Atlanta, Ga. Headquarters are at 905-6 Farley Bldg., Birmingham, Ala.

CLAIMS COMMISSION. See ARBITRATION, INTERNATIONAL.

CLARK UNIVERSITY. A nonsectarian university in Worcester, Mass., founded in 1889. It comprises a college for men, a coeducational graduate division of arts and sciences, and a coeducational senior college (extension courses) granting the degree of bachelor of education. The registration for the autumn of 1933 was 502 including 288 undergraduates, 74 graduate students, 25 special students, and 115 extension students. The enrollment for the summer session was 149. There were 39 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 142,000 volumes. President, Wallace W. Atwood, Ph.D.

CLEARWATER, ALPHONSO TRUMPBOR. An American jurist, died at Kingston, N. Y., Sept. 23, 1933. He was born at West Point, N. Y., Sept. 11, 1848, attended private schools in New York City, and after studying law in the offices of Hardenburgh and Schoonmaker was admitted to the bar in 1871, practicing thereafter in Kingston. Elected district attorney of Ulster Co. in 1877, he served by successive relections until 1886, and was also judge of Ulster Co. from 1889 to 1898. On the elevation of Alton B. Parker to the bench of the Court of Appeals in the latter year he was appointed justice of the Supreme Court. Judge Clearwater was an ardent advocate of judicial reform, being associated with David Dudley Field in the preparation of the Penal Code and Code of Criminal Procedure of the State of New York. Originally appointed a member of the New York State Probation Commission in 1909, he was reappointed in 1913 and after 1919 served as vice-president of that body. In 1915 he was delegate-at-large to the convention to revise the Constitution of the State of New York, in 1920 member of the convention to consider and adopt rules of civil practice in the courts of New York, and in 1921 member of the convention to revise the judiciary article of the State Constitution. He was also president after 1918 of the State Reservation Commission of Niagara Falls, and in 1925 was appointed commissioner to make recommendations to the New York Legislature on the consolidation of departments of the State government.

Judge Clearwater served as commissioner during 1895-98 in supervising the translation from Dutch into English of the early records of Ulster Co. He was also an authority on the history of the Dutch and Huguenot settlers of America, publishing such articles as "The Influence of the Dutch and Huguenots in the Formation of the American Republic"; "Louis XIV and the Revocation of the Edict of Nantes"; "The Founders of New Amsterdam"; "The Dutch of Albany and the Iroquois"; and "Dutch Governors of New York." His avocation was collecting early American silver, which he lent on various occasions to the Metropolitan Museum of Art.

CLIPPERTON ISLAND. A coral island in the Pacific Ocean (10° 13' N. and 109° 10' W.) about 500 miles southwest of Mexico and 1500 miles northwest of the Panama Canal. In dispute between France and Mexico, it was awarded to France in January, 1931, by the King of Italy acting as arbitrator. It is less than a square mile in area, with about 30 inhabitants, and has small phosphate deposits.

CLOUDS. See METEOROLOGY.

COAL. Preliminary estimates by the U. S. Bureau of Mines place the total coal production in the United States during the year at 377,339,000 net tons, of this total the output of bituminous coal was 327,940,000 tons, and of anthracite, 49,399,000 tons. Bituminous production showed an increase of 5.9 per cent over the final total of 309,710,000 tons for 1932, which was probably due in large part to the increased production of pig iron. There was little change in the amount consumed by public utilities and railroads during the year, but pig-iron production, according to *Coal Age*, New York, upon whose annual review number this article is based, showed an increase from 8,550,000 tons in 1932 to approximately 13,200,000 tons in 1933. A substantial increase in lake shipments accounted for much of the remaining increase, rising from 25,173,211 tons in 1932 to 32,333,393 tons in 1933.

The U. S. Bureau of Mines estimates that stocks of bituminous coal in the hands of industrial consumers on Jan. 1, 1934, were about 25,614,000 tons, as against 22,411,000 tons a year

to preliminary estimates of the U. S. Bureau of Mines. This slight decrease is considered as a favorable indication that the steady slump since 1926, as shown in the accompanying table, has reached its low mark.

ANTHRACITE PRODUCTION OF UNITED STATES [Net tons]

1914	90,821,000	1924	87,927,000
1915	88,895,000	1925	81,817,000
1916	87,578,000	1926	84,437,000
1917	99,612,000	1927	80,096,000
1918	98,826,000	1928	75,348,000
1919	88,100,000	1929	73,828,000

CODES. In accordance with the provisions of the National Recovery Act, the coal industries through operators, miner representatives, and dealers held many conferences for the purpose of drafting codes of fair competition in which divergent views might be reconciled. By October, the Code of Fair Competition for the Bituminous Coal Industry had been approved and had become effective. By the end of the year, despite much earnest effort to reconcile all differences, no other code had reached general agreement. The provisions of the bituminous code are briefly abstracted in *Coal Age*, vol. 39, no. 21, as follows:

To meet the insistent demand for the fullest measure of autonomy in the conduct of the internal affairs of the

COAL PRODUCED IN THE PRINCIPAL COUNTRIES OF THE WORLD IN THE CALENDAR YEARS 1931, 1932, AND 1933, IN THE USAND METRIC TONS*

earlier. Prices showed a general rise during the year, reflecting the wage increases made mandatory by the coal code adopted under the provision of the National Recovery Administration.

ANTHRACITE PRODUCTION IN 1933. The production of Pennsylvania anthracite dropped slightly less than 1 per cent in 1933 from 49,855,000 tons produced in 1932 to 49,399,000 tons, according

industry, for code administrative purposes the country is divided into five major divisions, each with its separate divisional code authority. In addition, subdivisions and subdivisional code authorities have been established in the divisions covering large geographical areas or producing large percentages of the national output. Division I, for example, embraces seven subdivisions—Ohio, western Pennsylvania, central Pennsylvania, northern West Virginia, the Southern high-volatile fields, the Southern low-volatile fields, and western Kentucky, Divi-

sion II has separate subdivisions for Illinois, Indiana, and Iowa. Division IV has two subdivisions—Kansas-Missouri-Oklahoma and Arkansas-Oklahoma. There are two subdivisions—northern Colorado and southern Colorado-New Mexico—in Division V.

The Presidential members of the divisional code authorities, four members designated by Division I, two by Division II, and one each by Divisions III, IV, and V and not to exceed three additional Presidential appointees, constitute the National Bituminous Coal Industrial Board. This board is subject to call from General Johnson and is empowered to consider and make recommendations to the divisional code authorities and to the President "as to any amendments to the code or other measures which may stabilize and improve the conditions of the industry and promote the public interest therein."

Specific recognition is given district selling agencies by empowering such agencies, when acting for producers "truly representative of at least two-thirds of the commercial tonnage of any coal district or group of districts," to initiate minimum prices for such district or districts. Where no such agencies exist, the duty of initiating minimum price schedules devolves upon the code authority for the division or subdivision. Subject to the approval of the Presidential member of the code authority and subsequent review by the National Recovery Administrator, prices so established must be observed as minima by the producers.

Controversies involving labor relations are handled first by local and district or divisional machinery and from there to divisional labor boards. Each divisional labor board consists of three members, one selected from

nominations made by employers, one from nominations made by labor, and one, as impartial member, from nominations made by the divisional code authority. Two such boards have been established in Division I, one each in the other four divisions. Members of these six divisional boards constitute the National Bituminous Coal Labor Board. Only impartial members have the power to vote on a controversy, the other members acting in an advisory capacity. This national board may be called into action when (a) a controversy involves employers and employees of more than one division; (b) the decision of a divisional labor board affects operating conditions in more than one division, either directly or because of its effect upon competitive marketing, and (c) in the opinion of the Administrator, the decision of a divisional labor board involves the application of a policy affecting the general public or the welfare of the industry as a whole.

For the purpose of establishing the minimum wage standards required by the law, the code divides the bituminous region of the country into seventeen districts. Two minimum rates were established for each of these districts—a minimum for inside skilled labor and a minimum for common outside labor. Where specific wage contracts were in existence at the time the code was promulgated, the minima set up in the code are the same as provided for in the wage agreements.

Base minimum rates of pay were established "with the understanding that other classifications of employment will maintain their customary differentials above or below said basic minimum rates and that payments for work performed on a tonnage or other piecework

* The figures relate only to active mines of commercial size that produced bituminous coal in 1932. The number of such mines in the United States was 5,427 in 1932; 5,642 in 1931; 5,891 in 1930.

Size classes of commercial mines in 1932: There were 82 mines in Class 1A (500,000 tons and over) producing 17.9 per cent of the tonnage; 383 mines in Class 1B (200,000 to 500,000 tons) with 37.8 per cent; 477 mines in Class 2 (100,000 to 200,000 tons) with 21.8 per cent; 469 mines in Class 3 (50,000 to 100,000 tons) with 11 per cent; 1,111 mines in Class 4 (10,000 to 50,000 tons) with 8.8 per cent; 2,805 mines in Class 5 (less than 10,000 tons) producing 2.7 per cent.

Methods of mining in 1932: The tonnage by hand was 29,550,036, shot off the solid, 16,285,682; cut by machines, 243,954,770; mined by stripping, 19,641,128; not specified, 278,256.

^b Based upon (1) the "reported" number of man-shifts where the operator keeps a record thereof; otherwise upon (2) the "calculated" number of man-shifts obtained by multiplying the average number of men employed underground and on the surface at each mine by the number of days worked by each group respectively. Using a "calculated" method throughout, the average output per man per day for the country as a whole was 5.33 in the bituminous mines; 2.63 in the anthracite mines combined, in 1932. These figures are strictly comparable with 5.30 in 1931 and 5.06 in 1930 in the bituminous mines; 2.37 in 1931 and 2.21 in 1930 in the anthracite mines; 5.54 in 1931 and 4.84 in 1930 in bituminous and anthracite mines combined.

basis shall maintain their customary relationship to the payments on a time basis provided in said basic minimum rates." Except where otherwise provided by agreement, all coal mined on a tonnage basis must be paid for by the ton. Employees are authorized to employ check-weighmen and/or check-measures. Wages due must be paid semi-monthly in lawful money or par check.

Living in company houses, except in the case of maintenance, supervisory men and others necessary to protect the property, and trading at company stores may not be made a condition of employment. In the absence of state laws naming a higher minimum, no person under 17 may be employed underground or in hazardous work outside and no person under 16 may be employed in any capacity in or about a mine. The code also provides a maximum work week of 40 hours and a maximum work day of 8 hours, except for certain specified small groups.

ACCIDENT PREVENTION. According to preliminary reports compiled by the U. S. Bureau of Mines, the combined total of fatalities in bituminous and anthracite operations in the United States was 1013 during 1933. On the basis of the estimated output of 377,338,000 tons, this lowers the number of fatalities to 288 per hundred million tons. Though unreported fatalities are expected to raise the number slightly, the record is still the best ever reached. In 1932 the fatalities per hundred million tons were 336.

COCHIN-CHINA, kô'chîn chî'nâ. A French colony occupying the southern tip of French Indo-China (q.v.). The territory is ruled directly by a governor and a colonial council of 24 members; it is represented in the French Parliament by one deputy. Governor in 1933, J. F. Krautheimer.

COFFIN, WILLIAM SLOANE. An American corporation official, died Dec. 16, 1933, in New York City where he was born Apr. 18, 1879. On his graduation from Yale University in 1900 he entered the furniture and real estate business, becoming president in the ensuing years of the Company of Master Craftsmen, Oneidacraft, Inc., Henry Williams Co., and the Creekfront Realty Co., and vice-president of W. & J. Sloane, the New York furniture firm. He embarked upon his civic activities in 1906 when he founded the Art-in-Trades Club, composed of those engaged in or interested in the industrial arts. Eighteen years later with Col. Michael Friedsam he established a fund to finance a four-year course in interior decorating at New York University. During the World War he was connected with the Y. M. C. A. and later made a survey of the devastated regions of France and Belgium in connection with appeals for the restoration of cathedrals there. For this service he received from the French government in 1919 the decoration of Chevalier of the Legion of Honor.

While president of the New York City Mission Society Mr. Coffin took a special interest in its social welfare work and sponsored the construction of its branch on West 118th Street for work among the city's Spanish-speaking population. He was also president of the Child Education Foundation and vice-president of the City Housing Corporation, offering in connection with the latter a plan for the construction of model tenements equipped with modern improvements and leased at low rentals. In 1931 he was appointed president of the board of trustees of the Metropolitan Museum of Art, his two-year administration being marked by efforts to make the museum

a centre of educational interest for people of all ages and classes. He had previously served as director, treasurer, and first vice-president, and for years was a member of the museum's appointive committee on American and European decorative arts.

COINS, VALUE OF FOREIGN. The legal estimates of the value of foreign coins on Jan. 1, 1934, as issued by the U. S. Secretary of the Treasury are given in the table on page 171.

COKE. The production of coke in 1933, according to the preliminary reports received by the Bureau of Mines, was 27,551,913 net tons, an increase of 26.4 per cent when compared with 1932. The chief cause of the increase in coke production was the greater activity of blast furnaces, the output of pig iron for 1933 increasing 52.1 per cent above the level of 1932. The figures for by-product coke are based on monthly reports received currently by the Bureau of Mines from each producer and are subject to very slight revision on the basis of final detailed reports for the year as a whole. The figures for beehive coke are estimates based on shipments reported by 12 of the principal railroads serving the beehive ovens.

PRODUCTION OF BY-PRODUCT AND BEEHIVE COKE IN THE UNITED STATES, 1929-1933

Year	Net tons produced		
	By-product	Beehive	Total
1929	53,411,826	6,472,019	59,883,845
1930	45,195,705	2,776,316	47,972,021
1931	32,355,549	1,128,337	33,483,886
1932	21,136,842	651,888	21,788,730
1933 *	26,722,413	829,500	27,551,913

* Preliminary figures.

Production, as shown in the accompanying table, increased during the year in all producing States except Tennessee, Utah, and Washington, the decline in Utah being almost 28 per cent. Ohio showed the greatest advance, 56.6 per cent over the previous year, with Pennsylvania and Colorado also showing advances of more than 50 per cent. In Indiana and Maryland production rose by 45.7 per cent and 40.6 per cent respectively over the previous year.

PRODUCTION OF BY-PRODUCT COKE, BY STATES, IN 1932 AND 1933

[Net tons]

State	1933 *	1932
Alabama	1,669,676	1,400,597
Colorado	139,722	92,384
Illinois	1,501,284	1,428,384
Indiana	2,090,799	1,435,405

The following preliminary estimates on the recovery of byproducts from coke-oven operations in 1933 are obtained by assuming that the quantity of byproducts recovered during 1933 bore the same relation to the known production of coke in 1933 as in 1932. No basis for estimating the production of ammonia is available.

Tar	884,000,000 gallons
Gas	439,000,000 M cubic feet
Crude light oil	79,000,000 gallons

The indicated consumption of coke in the United States during 1933 was 27,736,514 net tons, of which about 47 per cent or 13,122,000 tons were used by blast furnaces in the production of pig iron. Imports for the year rose to 161,034 tons (117,275 tons in 1932), while exports showed a slight drop, 629,433 tons in 1933 against 630,151 tons in 1932. For the manufacture of byproduct coke, 38,682,900 tons of bituminous coal were consumed, to which must be added 1,298,100 tons for beehive coke, giving a total coal consumption of 39,981,000 tons for the year.

COLGATE UNIVERSITY. A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1933 there were 947 students enrolled. The faculty numbered 95 members. The productive funds amounted to approximately \$6,500,000, and the income for the year was approximately \$508,955. The library contained 110,000 volumes.

The Carnegie Corporation of New York in 1933 made a grant to Colgate University of \$30,000 a year for four years to put the Colgate Plan into full operation. This plan divides the curriculum into six schools: physical sciences, biological sciences, social sciences, philosophy and religion, fine arts, and languages. Freshmen are assigned to preceptors, who meet them individually one hour a week and try to stimulate their intellectual interest. At the end of the freshman year each student chooses a school and at the end of the sophomore year a subject of concentration. Thereafter his work is largely in that subject, under the direction of a tutor, in the seminar tutorial method. The course comes to a climax in a comprehensive examination at the end of the senior year. President, George Barton Cutten, Ph.D., D.D., LL.D.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLIER TROPHY. See AERONAUTICS.

COLOMBIA. A South American republic, third in population and fifth in area among the states of that continent. Capital, Bogotá.

AREA AND POPULATION. Colombia has an area of 444,270 square miles, or larger than France, Germany, Austria, and Belgium together. The population was 7,851,000 at the census of 1928 and was estimated at 8,400,000 on Dec. 31, 1931. Racially the population was divided as follows: White, 35 per cent; Negro, 5 per cent; Indian, 2 per cent; mixed, 58 per cent. The chief cities, with their 1928 populations, are Bogotá, 235,421; Barranquilla, 139,974; Cali, 122,847; Medellín, 120,044; Cartagena, 92,494; Manizales, 81,091; Ibagué, 56,333; and Cúcuta, 49,279. Buenaventura (25,334 inhabitants), the chief Pacific port, was destroyed by fire in 1931, but was rebuilt. The population is 31 per cent urban and 69 per cent rural. The Colombians speak the purest Spanish in South America.

EDUCATION. In 1928, 52 per cent of the population over 10 years of age was literate, compared with 32 per cent in 1918. Elementary education

is free but not compulsory. Primary schools numbered 7495 in 1931, with 531,658 pupils. In 1930-31, there were 25 industrial schools, with 1392 pupils; 17 normal schools, with 1000 students, and other vocational institutions. The University of Bogotá and the School of Mines at Medellín are national universities; there are departmental universities at Medellín, Cartagena, Popayan, and Pasto.

PRODUCTION. Colombia ranks second to Brazil in the production of coffee, the normal crop being more than 3,000,000 bags (of 135 pounds) per year. In 1932 exports amounted to 3,184,328 bags, valued at \$42,910,412; the average price was 11.22 cents per pound for the year. Of the coffee exports, 88 per cent went to the United States. Other leading crops are bananas (exports of 7,021,000 stems valued at \$6,007,273 in 1932), tobacco, ivory nuts, cotton, sugar cane, corn, and many other products. Valuable forests, including rubber trees and dye and cedar woods, cover some 150,000,000 acres. Cattle raising is an important industry; there were some 7,500,000 head of cattle in 1932. There is a wide variety of rich mineral deposits. Petroleum output in 1932 was 16,414,000 barrels (18,237,000 in 1931); 1932 exports amounted to 15,320,000 barrels valued at \$16,437,783. Gold exports in 1932 were \$3,223,828; platinum, \$495,056. Besides being the first world producer of emeralds, the second producer of platinum, and the leading gold producer among the South American countries, Colombia also mines silver, copper, iron, tin, cinnabar, lead, nickel, asbestos, and other minerals. Manufacturing is relatively unimportant. Textiles sugar, matches, chocolate, tobacco products, cement, etc. are the chief products.

COMMERCE. Colombia's imports in 1932 were valued at 34,309,000 gold pesos and exports at 70,397,000 pesos, compared with imports of 41,056,000 pesos and exports of 98,009,000 pesos in 1931. (The gold peso equals \$0.9733 at par; it exchanged at \$0.9625 in 1931 and \$0.9528 in 1932.) The favorable balance of trade was 36,088,000 pesos in 1932 (56,953,000 in 1931). The United States in 1932 purchased Colombian exports to the value in United States currency of \$60,846,000 (\$75,482,000 in 1931) and supplied Colombia with imports valued at \$10,670,000 (\$16,052,000 in 1931). The chief exports, in order of value, were coffee, petroleum, bananas, gold, and platinum. The main import items were textiles, metal products, drugs, and chemicals, food-stuffs, machinery, paper and paper products, crockery and glassware, leather and leather goods, etc. Provisional 1933 figures placed the value of exports at 72,700,000 pesos and imports at 50,400,000 pesos.

FINANCE. The national financial accounts for the fiscal calendar years 1929-33, including both ordinary and extraordinary accounts, are shown in the accompanying table from the *Statistical Year-Book* of the League of Nations.

COLOMBIA: REVENUE AND EXPENDITURE

[In gold pesos worth \$0.973 at par]

Year	Receipts (million pesos)	Expenditures (million pesos)	Surplus (+) or deficit (-)
1929	75.2	82.2	- 7.0
1930	49.4	60.1	- 10.7
1931	43.7	47.6	- 3.9
1932 *	84.8	34.8
1933 *	40.4	86.2	+ 4.2

* Estimates. * Ordinary budget only.

Actual receipts in 1932 were 44,570,000 pesos (ordinary receipts, 35,523,000 pesos) and actual expenditures were 43,529,000 pesos (ordinary, 34,806,000 pesos). In 1933 preliminary returns showed receipts of 39,200,000 pesos in the ordinary budget and expenditures of 33,000,000 pesos. Extra budgetary transactions increased the surplus to 7,400,000 pesos. The increase in budget expenditures in 1933 was due partly to military expenditures in anticipation of war with Peru (see PERU under *History*). In the budget for 1934, as passed by Congress, estimates for ordinary revenues and expenditures balanced at 36,428,000 pesos and extraordinary revenues and expenditures balanced at 1,110,000 pesos. In the ordinary budget 8,751,000 pesos was set aside for the service of the public debt and 6,000,000 pesos for defense.

The total external public debt on Dec. 31, 1932, was equivalent to 193,742,205 pesos, of which 63,948,258 pesos represented the national foreign debt, the remainder being obligations of the departments, municipalities, and banks. The internal debt outstanding Dec. 31, 1932 was 35,362,416 pesos. Currency in circulation on Apr. 30, 1933, totaled 58,804,000 pesos. On Mar. 29, 1933, the Colombia government authorized the total or partial suspension of service on the external funded debt.

COMMUNICATIONS. Colombia in 1933 had 2075 miles of railway line in operation, divided among 15 systems (11 national and 3 British). Most of the lines serve as feeders to the Magdalena River, the main traffic artery of the country, which is navigable by 500-ton steamers for 514 miles from Barranquilla on the Caribbean to La Dorada. Automobile highways in 1933 extended 4550 miles; other roads, 35,450 miles. Air lines connect the principal cities and link Colombia with most of the other American republics. There is a modern telephone system in every important city. In 1933, there were 197,520 miles of telephone line, 22,807 miles of telegraph line, 21 commercial radio stations, and radio telephone connections with the rest of the world. Modernization of the port of Cartagena was completed in 1933 at a cost of \$3,000,000.

GOVERNMENT. Executive power is vested in a president elected for four years by direct popular vote, and ineligible for reelection until four years after the expiration of his term. Legislative power rests with a Congress of two houses, the Senate and House of Representatives. The 56 Senators are elected for four years by Departmental Assemblies; the 118 Deputies for two years by direct suffrage. President in 1933, Dr. Enrique Olaya Herrera (Liberal), elected for the term expiring Aug. 7, 1934.

HISTORY

LETICIA CONTROVERSY SETTLED. During the first quarter of 1933, the attention of the Colombian government and people was concentrated upon the effort to regain control of Leticia and the surrounding "corridor" on the Amazon. This had been seized by Peruvian citizens on Sept. 1, 1932. Colombian troops and naval forces dispatched to the scene via the Amazon and overland came into contact with Peruvian forces near Leticia early in 1933 and several clashes ensued. The struggle had not yet assumed serious proportion, however, when on May 25, the League of Nations, supported by the United States and the other neutral American republics, induced both governments to turn the Leticia corridor over to

a League Commission pending a final agreement on the issue. Negotiations for a settlement opened in Rio de Janeiro October 25 and were still under way at the end of the year. Meanwhile, Colombia and Peru withdrew their military forces. For details of the Leticia affair in 1933, see PERU under *History*.

In anticipation of war, Colombia had floated a national defense loan of 10,000,000 pesos, inaugurated higher income taxes, and conscripted all males between 20 and 45. Some 10,000 men were concentrated in the vicinity of Leticia, despite its inaccessibility.

FINANCIAL DEFAULTS. The world economic depression had already placed a severe strain upon Colombia's financial structure. When the prospect of war between Colombia and Peru became imminent the government in March, 1933, decided to declare a temporary moratorium on the external funded debt. A decree to this effect, issued March 29, authorized the government to arrange with its creditors for a reduction of the foreign debt service. It also gave the government power to eliminate subsidies and payments to the departments and municipalities provided for in the 1933 budget. After defaults on May 1 and 15 on dollar bonds of the Agricultural Mortgage Bank of Colombia, guaranteed by the government, and a sterling loan, the government offered to pay one-fourth of the service charges on the bonded debt in cash and the remainder in 3 per cent scrip, redeemable within five years. This plan, revised several times during the year, aroused many protests among bondholders' committees in the United States.

The merging of two large private mortgage companies with the government-controlled Agricultural Mortgage Bank and the Central Mortgage Bank of Colombia also led to protests of the bondholders. They charged that the action of the government impaired the rights of American bondholders of the two private institutions—the Mortgage Bank of Colombia and the Mortgage Bank of Bogotá.

EXCHANGE CONTROL MODIFIED. The rigid system of exchange control inaugurated in 1932 was radically modified Sept. 25, 1933 and a partially free exchange system established. Nevertheless, it was reported from Bogotá October 31 that there was a shortage of dollar exchange to meet pending and accruing requirements of importers. A commercial treaty with the United States, which was expected to improve the exchange situation by permitting increased sales to the United States, was signed in Washington Dec. 15, 1933.

DOMESTIC POLITICS. The Liberals during 1933 further entrenched themselves in power, which previous to the election of President Olaya Herrera in 1930 had been exercised for nearly half a century by the Conservatives. The biennial Congressional elections of May 14, 1933, increased the Liberal representation in the Chamber of Deputies from 52 to 72, giving the party its first safe majority in the Chamber in decades.

Municipal elections held throughout the country on October 1 gave the Liberals majorities in the city councils of all state capitals and about 80 per cent of the seats in all councils. In many cities, the Conservatives boycotted the elections.

With the Presidential election scheduled for the second Sunday in 1934, the political campaign got under way toward the end of 1933. A convention of Liberal leaders on November 5

bestowed the party nomination upon Dr. Alfonso Lopez, former Minister to London, who was responsible for the conclusion of the agreement with President Benavides of Peru on the Leticia issue. On November 14, it was reported that the national committee of the Conservative party had decided to boycott the presidential election. The struggle between the parties was fought out in part in Congress, where Conservative obstruction retarded essential legislation. One important law passed authorized the government to improve the mouth of the Magdalena River so as to permit larger steamers to enter Barranquilla. The Liberals in Congress renewed their attack upon the relations existing between the state and the Roman Catholic Church. Some demanded a revision of the Concordat with the Vatican. Effective in 1934, the number of Cabinet ministers was increased to nine, under a decree issued by President Olaya Herrera on Nov. 3, 1933.

COLON ISLANDS. See ECUADOR.

COLORADO. POPULATION. The population of the State on Apr. 1, 1930, was 1,035,791 (Fifteenth Census); in 1920 it was 938,629; in 1933 (Federal estimate), 1,052,000. Denver, the capital, had (1930), 287,861 inhabitants.

AGRICULTURE. The following table shows the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame)	1933	1,334,000	1,993,000*	\$10,563,000
	1932	1,274,000	1,830,000*	11,895,000
Sugar beets.	1933	211,000	2,624,000*
	1932	156,000	1,777,000*	8,209,000
Corn	1933	2,004,000	22,044,000	7,495,000
	1932	1,909,000	14,318,000	3,150,000
Wheat	1933	548,000	5,912,000	3,455,000
	1932	680,000	7,135,000	2,191,000
Potatoes ...	1933	87,000	13,050,000	6,264,000
	1932	100,000	11,000,000	2,640,000
Barley	1933	430,000	6,880,000	1,926,000
	1932	439,000	7,244,000	1,449,000
Dry beans .	1933	345,000	1,138,000*	8,016,000
	1932	221,000	438,000*	657,000
Oats	1933	162,000	4,131,000	1,157,000
	1932	141,000	3,736,000	785,000

* Tons. * 100-lb. bags.

MINERAL PRODUCTION. There were produced, in 1932, some 5,564,000 net tons of coal, which was nearly 16 per cent less than the 6,604,369 tons of 1931 and 44 per cent less than the total for 1929. The production of coke used over one-eighth of the year's product of coal and attained 92,384 tons of coke.

The production of gold (1932) attained the value of \$6,493,377; of silver, \$480,353; copper, \$451,395; lead, \$123,504; zinc, \$6540; total of all five, \$7,555,169 (1932).

The production of 1933 (partly estimated) totaled 242,008 oz. of gold, 2,242,646 oz. of silver, 4,510,000 lb. of lead, 9,948,000 lb. of copper, and 2,491,000 lb. of zinc. The value of the totals was: Gold, at \$20.67 an oz., \$5,002,749; silver, \$773.713; lead, \$166,870; copper, \$636,672; zinc, \$107.113; all five, \$6,087,117.

The production of petroleum in 1932 totaled 1,177,000 barrels, which was 24 per cent below the total for 1931.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments, \$13,750,239 (of which \$672,510 was for local education); for interest on debt, \$340,245; for permanent improvements, \$7,355,416; total, \$21,445,900 (of

which \$10,992,200 was for highways, \$4,266,118 being for maintenance and \$6,726,082 for construction). Revenues were \$21,880,061. Of these, property and special taxes furnished 27.3 per cent; departmental earnings and compensation to the State for officers' services, 8.9; sale of licenses, 38.1 (in which was included a gasoline sale tax that produced \$5,956,043). Funded debt outstanding on June 30, 1932, totaled \$7,355,014, of which \$5,193,000 was for highways. Net of sinking-fund assets, the debt was \$5,940,236. On an assessed valuation of \$1,438,448,065 the State levied in the year ad-valorem taxes of \$5,043,593.

EDUCATION. A minimum-salary law applying to teachers in the public schools was credited with rendering it possible to keep the schools open generally, in the face of the deficiency in their ordinary sources of revenue. Under this law a country-wide tax was supplemented with contributions from the State's public-school income fund.

For the academic year 1931-32, the latest for which figures were furnished, the number of persons of school age in the State was reckoned as 315,369. There were enrolled in the public schools 257,940 pupils. Of these, 177,385 were in common schools or elementary grades; in high schools, 69,689. The year's expenditures for public-school education totaled \$24,441,542. Salaries of teachers averaged \$1423 for the year 1931-32; they were subsequently much reduced.

LEGISLATION. The Legislature convened in regular session on January 4. It made the Governor a grant, in the banking emergency that became acute during the session, of sweeping powers to deal with the affairs of institutions in the State banking system. Provision was made for closer supervision of insurance companies through the commissioner of insurance. A measure was passed to provide for a special election to choose delegates to a State convention which should act for the State with regard to ratifying the Federal proposal for repealing the Eighteenth Amendment; but Governor Johnson vetoed the measure, declaring the expense of a special election not justifiable.

A special session in August created a State convention, to be elected by popular vote and to act for the State in the matter of the proposal repeal of the Federal Eighteenth Amendment. Another special session, convened in December, dealt with the matter of providing public assistance to the destitute, out of the State's funds. An act of 1933 substituted death by lethal gas, in place of hanging, as the State's mode of capital punishment. An existing old-age-pension law, which had been declared unconstitutional, was superseded by a new law.

POLITICAL AND OTHER EVENTS. At a popular election on September 12 delegates in favor of repealing the Federal Eighteenth Amendment were elected by a light vote in the proportion of somewhat more than 2 to 1. These delegates met in State convention on September 26 and adopted, for the State, the superseding amendment proposed by Congress. A suspension bridge over the Royal Gorge of the Arkansas River, at a height of 1053 feet above the bottom of the canyon, was finished and opened for traffic in April.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, Ed. C. Johnson, Lieutenant-Governor, Ray H. Talbot; Secretary

of State, Charles M. Armstrong; Auditor, Benjamin F. Stapleton; Treasurer, Homer F. Bedford; Attorney General, Paul P. Prosser; Superintendent of Public Instruction, Inez Johnson Lewis.

Judiciary. Supreme Court: Chief Justice, John T. Adams; Associate Justices, Francis E. Bouck, Benjamin C. Hilliard, Haslett P. Burke, Julian H. Moore, Charles C. Butler, and John Campbell.

COLORADO, UNIVERSITY OF. A coeducational, State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1933 was 2787; the summer session enrollment was 1727. There were 328 faculty members, exclusive of assistants. The total income for general maintenance from State tax, fees, tuition, etc., was estimated at \$1,100,000, while \$500,000 was received for the operation of hospitals, including fees. The library contained 280,065 volumes, 17,000 pamphlets, and 3300 maps. President, George Norlin, Ph.D., LL.D.

COLUMBIA UNIVERSITY. A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway and 116th Street, are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts and New College; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and the non-professional graduate faculties of political science, philosophy, and pure science. The college of physicians and surgeons and the school of dental and oral surgery are at the Medical Centre on West 168th Street, the college of pharmacy on West Sixty-eighth Street, Seth Low Junior College in Brooklyn, N. Y., St. Stephen's College at Annadale-on-Hudson, N. Y., and the New York Post-Graduate Medical School on East Twentieth Street. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, a well as of several extramural centres.

On the basis of the enrollment on Nov. 1, 1933, the total number of resident students for the year was estimated at 27,107, distributed as follows: Undergraduates, 3141, of whom 1662 were in Columbia College, 1003 in Barnard College, 217 in Seth Low Junior College, 105 in St. Stephen's College, and 154 in other schools; and graduate students, 2821. The distribution of professional students was as follows: Law, 653; medicine, 449; engineering, 263; architecture, 92; journalism, 63; business, 442; dental and oral surgery, 247; pharmacy, 419; optometry, 71; library service, 315; and Teachers College, 5996; 4847 students were enrolled in university classes and 260 were unclassified. Of the 3135 non-resident students, 1200 were registered in home-study courses and 1935 in special extra-mural courses. There were 9200 students registered

for the summer session of 1933. The grand total of resident students is exclusive of 2171 duplicate registrations.

The faculty and officers of administration in 1933 numbered 3050, of whom all but 55 were in active service. This number was distributed as follows: Professors, 378; associate professors, 190; assistant professors, 299; associates, 220; instructors, 519; lecturers, 79; assistants, 315; curators, 4; associates, instructors, lecturers, and assistants in Teachers College, 169; instructors and lecturers in the college of pharmacy, 14; instructors in extension and home study, not included above, 425; instructors in summer session, not included above, 309; officers of administration, 74.

The following professorial and administrative appointees were made for the year 1933-34: Herbert Barber Howe, director of men's residence halls; Bernard Sachs, clinical neurology; Harry Aranow, obstetrics; Herbert Brucker, journalism; Walter Gellhorn, law; Enrique Koppisch, pathology; Edwin Bernard Matzke, botany; Rudolf Schoenheimer, biological chemistry; Herbert Wechsler, law, John Notkin, neurology; Felix Bernstein, formerly professor of mathematics at the University of Göttingen and director of the Institute of Mathematical Statistics; Paul Tillich, formerly professor of philosophy at the University of Frankfurt.

Among the important events of the year was the celebration of the centenary of Sir Walter Scott's death, the exhibit of books and manuscripts relating to his life and work, and the lecture on his personality and literary achievement by Prof. Herbert J. C. Grierson of the University of Edinburgh, visiting professor of English literature. The school of journalism held also an exhibit of original seventeenth, eighteenth, and nineteenth century English and continental newspapers, belonging to the Press Club of London and including the royal proclamations from 1661 to 1840 which deal with the control of the printing press and the public responsibilities of newspapers. At the Medical Centre there was opened the Institute of Ophthalmology, adding thereby to the equipment of the college of physicians and surgeons for health service and research.

During 1932-33 the university received gifts in money representing a total of \$1,755,866. The principal gifts were \$1,200,000 from Edward S. Harkness toward the construction and equipment of South Hall; \$160,722 from the Rockefeller Foundation, for various forms of research work; \$75,000 from the estate of William Fitts Randolph for the capital funds of the university; \$31,649 from the Commonwealth Fund for various forms of research work; \$29,900 from Edward S. Harkness toward the support of the department of diseases of children; \$25,000 from the Carnegie Corporation, toward the support of the school of library service; \$17,189 from the General Education Board for the work of the department of practice of medicine and of the sub-department of tropical diseases; \$13,400 from the Josiah Macy, Jr., Foundation for various forms of research work; \$11,100 from the Hartley Corporation for the Marcellus Hartley Laboratory and for work in psychiatry; \$10,800 from the estate of Charlotte Dibblee for the maintenance of scholarships; \$10,000 from the Italian government to establish the Giuseppe Garibaldi Memorial Fund; \$10,000 from an anonymous donor for the work of the Institute of Cancer

Research; \$10,000 from the W. K. Kellogg Foundation for the study of rheumatic fever. Gifts to income totaled \$418,638.

The capital endowment of the university in 1933, excluding value of plant (including Barnard College, Teachers College, college of pharmacy, St. Stephen's College, and the New York Post-Graduate Medical School), was \$87,247,821. The estimated total resources as of June 30, 1933, were \$153,624,117. The annual budget for 1933-34 was \$14,802,570. The library contained 1,405,518 volumes. President, Nicholas Murray Butler, Ph.D., Hon.D., LL.D., Litt.D.

COMMUNISM. The fiftieth anniversary of the death of Karl Marx on Mar. 14, 1933, found communism in process of extinction in its most promising stronghold outside of the Soviet Union. Utilizing the Reichstag fire of February 28 to work up a great Communist "scare," Hitler's National Socialists won control of the German Reichstag in the March 5 elections and proceeded with ruthless efficiency to stamp out the powerful German Communist party, with its voting strength of more than 5,000,000. One of Hitler's first acts after the March 5 election was to outlaw the Communists and oust their 81 deputies from the Reichstag. The party organization was completely shattered, its headquarters and property confiscated, and its members imprisoned or driven out of the country.

This crushing defeat of communism by fascism in Germany symbolized a world-wide trend in the struggle between two bitterly antagonistic doctrines. In every country where democratic government was absent or breaking down, except in the Soviet Union itself, fascism appeared to be winning the struggle with communism for control of the state. Outside of Germany, communism had shown its most rapid growth in isolated sections of the interior provinces of China. In southeastern Kiangsi and western Fukien it had maintained a Soviet administration for several years, had spread over large adjacent areas, and withstood repeated attacks by large Nanking armies. Early in 1933 Communist armies seized control of the northeastern part of Szechwan Province and won sweeping successes in Hunan, Hupeh, and Anhwei. Toward the end of the year they formed an alliance against Nanking with the insurrectionary government established in Fukien province. Severe fighting followed, but the Communist and Fukien forces were meeting successive defeats at the hands of Gen. Chiang Kai-shek's Nationalist armies when the year closed.

Communist efforts to swing the Socialist-Republican government of Spain further to the Left and eventually to capture control likewise received a severe setback in 1933. A strong reaction against radicalism was manifested in various Spanish elections. Repeated Communist and Anarchist uprisings were crushed by the government. In January Communists attempted to establish a Soviet government in the province of Valencia and staged violent general strikes in Barcelona, Valencia, Cuenca, and Cadiz. Fifty workers and soldiers were killed in the fighting.

The growth of communism during 1933 was marked in several Balkan countries, due to the agricultural depression and great suffering among

the peasantry. The Bulgarian government, alarmed by the aggressive tactics of the Communists, ousted the 30 Communist deputies from parliament and excluded the Independent Labor (Communist) party members from public offices and public employment. A growing number of strikes and riots in Greece were attributed to Communists, but the electoral returns showed a further swing toward reaction, represented by the Royalist party. Communist activities in Rumania became widespread due to discontent with economic conditions. Martial law was proclaimed in February, 1933, after large-scale strikes and riots, and remained in force for about six months. Disturbed conditions in Cuba during the year offered a field for Communist agitation. The Grau San Martin government was forced to take strong measures in self-defence. Troops broke up a great Communist demonstration in Havana September 29, killing nine demonstrators. Thereafter vigorous efforts were made to repress the movement, but with only partial success.

Meanwhile the Communist party in the Soviet Union was strengthening its control. It had won increased prestige through the successful completion of the first Five-Year plan and the collectivization of agriculture. For the first time, Stalin in 1933 faced little or no opposition to his policies within the ranks of the party. In accordance with his policies, the Soviet government accepted the temporary failure of the anticipated "world revolution," and concentrated its efforts upon building and strengthening the Communist state in Russia. The Communist (Third) International at Moscow was restrained from carrying on propaganda or agitation abroad where such activities promised to have adverse repercussions upon the Soviet Union's peaceful relations and trade with other countries. An example of this policy was the agreement reached between President Roosevelt and Maxim Litvinov, previous to American recognition of the Soviet Union. The Soviet government promised unconditionally not to permit the Third International to carry on Communist propaganda or agitation within the United States.

CONGO, BELGIAN. A colony of Belgium in Central Africa, formerly the Congo Independent State, which was annexed in 1908. Area, estimated at 918,000 square miles; native population (Bantu origin), 9,584,936 in 1930. The white population on Jan. 1, 1932 was 22,482, including 15,034 Belgians, 1493 Portuguese, 1473 Italians, 935 British, 658 Greeks, 575 Americans, and 554 French. Leopoldville, the capital, had a population of 43,000 (3000 white) in 1930; Elizabethville, 32,600 (4000 white). Other important towns are Boma, Stanleyville, and Coquilhatville. Chil-

dren receiving elementary education numbered 287,779 on Jan. 1, 1932.

The chief agricultural products are palm nuts, palm oil, white copal (resin), rubber, coffee, cotton, and cacao. Ivory is plentiful. Cattle do well only in the districts free from the tsetse fly, such as the highlands of Katanga, Ituri, and Kiva. The Katanga district is one of the world's important sources of copper, the production for 1931 being 120,000 metric tons. Gold, radium, cobalt, coal, and tin also are mined and iron, platinum, palladium, vanadium, zinc, and beuxite are known to exist. For 1932, imports were valued at 464,631,939 francs (961,891,851 francs in 1931); exports, 667,922,436 francs (1,104,045,231 francs in 1931). The Belgian franc equaled \$0.02784 at par. Government ordinary revenue and expenditure for 1933 was estimated at 357,736,580 francs and 725,757,940 francs respectively. The public debt on Jan. 1, 1933 was 4,959,253,033 francs.

In 1932 highways extended 26,117 miles; telephone lines, 4000 miles; telegraph lines, 4209 miles; railways, on July 1, 1932, 2566 miles. Steamships provide means of transport along the navigable stretches of the Congo River and its branches. During 1931, 493 steamships aggregating 1,903,573 tons entered and 488 aggregating 1,878,224 tons cleared the ports of Boma, Banana, and Matadi. The chief administrative centres are connected by air lines.

A governor-general and several vice governor-generals administered the colony on behalf of the Belgian King and the budget is voted by the Belgian parliament. The colony is divided into four provinces which are in turn divided into 16 administrative districts. There is a military force of 13,212 natives officered by 289 Europeans, and a territorial police force of 5550 men. Governor-General in 1933, Lieut.-Gen. A. Tilkens.

RUANDA-URUNDI. Two districts formerly in German East Africa which were turned over to Belgium as mandatory of the League of Nations and in 1925 were united administratively with the Belgian Congo. The chief exports are livestock and hides. Total area about 20,550 square miles; estimated population 3,500,000. The capital is Usumbura.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGO INDEPENDENT STATE. See CONGO, BELGIAN.

CONGREGATIONAL AND CHRISTIAN CHURCHES. THE GENERAL COUNCIL OF THE. The General Council of the Congregational and Christian Churches was instituted at Seattle, Wash., June 26, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The formal existence of the former organizations, however, was continued for the time being against possible legal necessities. The general council was to carry on the administrative affairs of the united churches but with no ecclesiastical authority, as the plan of union provides for local autonomy in the individual church and in groups of churches associated together. Its next meeting was to be held in Oberlin, Ohio, June 21-27, 1934. For the early history of these churches consult THE NEW INTERNATIONAL ENCYCLOPEDIA, VOL. V, pp. 285 and 737 ff. and THE NEW INTERNATIONAL YEAR BOOK FOR 1932.

Statistics for the Congregational and Christian

churches as of Jan. 1, 1933, showed 6379 churches, 6435 ministers, and a church membership of 1,040,119. There were 3452 young people's societies, with a membership of 181,943. The Sunday school enrollment was 774,475. The total raised for all benevolences was \$2,792,315, and the home expenses of the churches were \$16,623,466.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in the United States, having been organized June 29, 1810. On Jan. 1, 1933, there were 16 missions under 11 different flags; the stations connected with these missions numbered 97 and the outstations 2190. The missionaries holding life appointments numbered 602 and included 137 ordained men, 68 unordained men, 205 wives, and 192 single women. There were also 63 associates serving for shorter periods, bringing the total number of missionaries up to 665, while native workers numbered 5398. Religious services were conducted in 2690 places. The organized churches numbered 745, with 103,310 communicants. The total church constituency numbered 314,802; Sunday schools, 1540; theological seminaries and training schools, 30, with an attendance of 2013 students; colleges, 10, with 3232 students; secondary schools, 67, and primary and elementary schools, 1168, with a total enrollment of 74,620. There were 31 hospitals and 52 dispensaries, with a staff of 43 physicians and 29 foreign nurses. Total expenditures of the board for the year ending Aug. 31, 1933, were \$1,762,507.

Another tested agency is the American Missionary Association, which began its major work following the Civil War in the field of education among Negroes, opening such schools as Hampton Institute, Atlanta, and Fisk Universities, and Talladega, Straight, Tougaloo, and Tillotson Colleges, some of which have since become independent. In similar ways, through school and church, it has served the mountaineers of the South, the Indians of the West and Southwest, and the Puerto Ricans. In 1932 the association reported direct connections with 23 schools and colleges, enrolling 4600 students, and 161 churches with 10,379 members. Expenditures for the same year were \$1,095,216. The association holds properties and trust funds amounting to \$14,000,000.

A wide range of home missionary activities is carried on by the Congregational Church Extension Boards, including the Congregational Home Missionary Society, the Congregational Church Building Society, and the Congregational Sunday School Extension Society. They organize churches, establish church schools, aid needy congregations in the support of their ministers, give specialized service to foreign-speaking groups and to Negroes in the North, and assist in church and parsonage building. The more strictly home missionary service covers two-thirds of the territory of the United States, containing one-third of its population. In the remainder of the country similar work is done by independent State conferences. In 1932 these societies helped to maintain 637 churches and preaching stations, having a total membership of 32,564, and received 2630 persons into church membership. There were enrolled 457 workers, including students employed for short-term summer service. Expenditures for church and parsonage aid amounted to \$440,721; total expenditures, in-

cluding payments from revolving funds, amounting to \$795,993.

Comprising the Congregational pension boards are three societies: the Congregational Board of Ministerial Relief; the Annuity Fund for Congregational Ministers; and the Retirement Fund for Lay Workers. The Congregational Board of Ministerial Relief, which makes free grants to needy aged and disabled Congregational ministers, disburses annually approximately \$250,000. The Annuity Fund for Congregational Ministers, endowed by the Pilgrim Memorial Fund of \$5,000,000, disburses to its 2665 members approximately \$300,000 in annuities. The Retirement Fund for Lay Workers is a plan under which lay workers in Congregational organizations may provide retirement annuities for themselves with the aid of their employing agencies.

Among the theological seminaries with which the Congregational and Christian denominations are affiliated are the Chicago Theological Seminary, Divinity School of Yale University, Hartford Seminary, Oberlin Graduate School of Theology, Atlanta Theological Seminary Foundation (Nashville, Tenn.), Union Theological College (Chicago), and the Pacific School of Religion. In addition there are 41 colleges which have had some historical relation to Congregationalism, although a number of them are now undenominational. The Christian denomination has affiliation with Elon and Defiance Colleges.

The accompanying table, reprinted from the *Year Book* of the Congregational and Christian Churches, 1932, gives statistics of international Congregationalism:

INTERNATIONAL CONGREGATIONALISM

Countries	Churches, Chapels, and Stations	Members of Churches	Members of Sunday Schools
Africa *	1,423	37,099	24,166
Argentina ^b	27	2,200
Australia and New Zealand	534	21,031	35,071

* Includes reports of London Missionary Society and American Board.

^b Repeated from last *Year Book*.

^c United Church. Comprises the former Presbyterian, Methodist and Congregational churches.

^d Includes United Church of Canada as noted above.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City, with a regional office in the Christian Publishing Association Building in Dayton, Ohio. The Congregational Publishing Society maintains branches at

14 Beacon Street, Boston, and at 418 South Market Street, Chicago. The officers of the general council during 1933 were: moderators, the Rev. Carl S. Patton, Los Angeles, Calif., and the Rev. Frank G. Coffin, Columbus, Ohio; secretary, the Rev. Charles E. Burton, New York City; associate secretary, the Rev. Frederick L. Fagley, New York City; assistant secretary, the Rev. Warren H. Denison, Dayton, Ohio; treasurer, William T. Boulton, New York City.

CONNECTICUT. POPULATION. The population of the State on Apr. 1, 1930, was 1,606,903 (Fifteenth Census); in 1920 it was 1,380,631; in 1933 (Federal estimate), 1,646,000. Hartford, the capital, had (1930) 164,072 inhabitants.

AGRICULTURE. The following table shows the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame)	1933	252,000	328,000	\$5,117,000
	1932	249,000	309,000	5,129,000
Tobacco	1933	11,600	15,688,000	4,037,000
	1932	15,400	22,099,000	4,143,000
Corn	1933	53,000	2,067,000	1,488,000
	1932	54,000	2,268,000	1,225,000
Potatoes	1933	13,000	2,080,000	2,080,000
	1932	12,000	1,980,000	990,000
Apples	1933	1,184,000	1,006,000
	1932	1,420,000	994,000

* Tons. ^b Pounds.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$22,703,454 (of which \$1,657,261 was for local education); for interest on debt, \$604,840; for permanent improvements, \$18,080,037; total, \$41,400,545 (of which \$13,331,945 was for highways, \$2,938,917 being for maintenance and \$10,393,028 for construction). Revenues were \$37,470,591. Of these, property and special taxes furnished 20.6 per cent; departmental earnings and compensation to the State for officers' services, 6.7; sale of licenses, 53.0 (in which was included a gasoline sale tax that produced \$4,795,448). Funded debt outstanding on June 30, 1932, totaled \$13,351,100, which was less than the sinking-fund assets. On an assessed valuation of \$3,161,283,930 the State levied in the year ad-valorem taxes of \$1,775,355.

EDUCATION. Classes for adults who could not speak English were required in all towns in which such adults were numerous enough to justify establishing these classes. Evening classes of a general character were required to be held in cities and the most populous towns.

For the academic year 1932-33 the number of persons of school age in the State was reckoned as 367,581. There were enrolled in the public schools 325,859 pupils. Of these, 236,475 were in common schools or elementary grades; those in junior high schools numbered 17,476; in other high schools, 71,908. The year's expenditures for public-school education totaled \$30,564,989. Teachers' salaries, for the year, averaged \$1507 in the elementary schools, \$1828 in the junior high schools, and \$2046 in the other high schools.

CHARITIES AND CORRECTIONS. Under the system in force in 1933 the institutions maintained by the State for the care and custody of persons were managed by appointed boards and were supervised by the Department of Public Welfare. This department was composed of a board of five members, appointed for terms of four years, and

of two executive heads. Of the latter, one was secretary of the department (William W. T. Squire), and the other had charge of a bureau of child welfare. There were nine major State institutions concerned with welfare. The State contained also 10 private hospitals for mental cases, 10 county jails, 53 almshouses, 33 State-aided hospitals, and 42 homes for the aged. State institutions, with their populations of June 30, 1933, were: Connecticut State Prison, Wethersfield, and prison farm, 670 and 123 respectively; State Farm for Women (prisoners), Niantic, 308; Connecticut School for boys, Meriden 336; Connecticut School for Girls, Middletown, 248; Connecticut Reformatory, Cheshire, 384; Connecticut State Hospital, Middletown, 3117; Norwich State Hospital, Norwich, 2832; Fairfield State Hospital, Newtown, 99; Mansfield State Training School and Hospital (epileptics and feeble-minded), 1119; Mystic Oral School (for the deaf), Mystic, 120.

LEGISLATION. The legislature met in regular session on January 4. It created a convention to act for the people of the State with regard to the proposed repeal of the Eighteenth Amendment. The members of this convention were to number 50, of whom 35 were to be chosen by Senatorial districts and 15 at large, all at a special election to be called by the Governor. After a contest between the supporters of Governor Cross, who wanted a system of State control over alcoholic drinks, and municipal interests wishing local control, the sale of beer having not over 3.2 per cent of alcohol was made lawful, subject to control by a State commission of three men. During the banking panic of early March emergency powers were given the Governor to declare banking holidays when he found these needful to preserve the banks from runs; to permit banks to require three months' notice for withdrawals of saving accounts; and to give the banking commissioner power to limit ordinary withdrawals of deposits.

The use of mechanical directing signs was required on all motor vehicles so constructed as not to permit the driver to signal with the hand to a following vehicle.

POLITICAL AND OTHER EVENTS. In the country-wide closing of banks, those of Connecticut remained open until March 4, when they were closed by proclamation of a legal holiday. There were elected by popular vote, on June 20, 50 delegates to a State convention on repeal of the Federal Eighteenth Amendment; all 50 were favorable to repeal. The convention met on July 11 and adopted repeal, as proposed by Congress in the superseding amendment. Members of the public-utilities commission refused in August to give the Hartford Electric Light Company assurance of higher rates in case it should comply with the requirements of the National Recovery Administration as to hours and pay of employees.

By ruling of the Deputy Attorney General on October 25 it was declared unlawful for a mutual savings bank of the State to assume the obligation to participate in the system of Federal insurance of bank deposits, required of banks entering the Federal Reserve system. In the elections of November 7 Jasper McLevy, Socialist, was elected mayor of Bridgeport, by a vote of 22,546 to 16,584, with other members of a Socialist municipal ticket.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, Wilbur L. Cross;

Lieutenant-Governor, Roy C. Wilcox; Secretary of State, John A. Danaher; Treasurer, J. William Hope; Comptroller, Anson F. Keeler; Attorney General, Warren B. Burrows.

Judiciary. Supreme Court of Errors: Chief Justice, W. M. Maltbie; Associate Judges, F. D. Haines, G. E. Hinman, John W. Banks, Christopher L. Avery.

CONNECTICUT COLLEGE. A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut. The enrollment for the autumn of 1933 was 613. The faculty numbered 65 members. The productive funds amounted to \$1,486,817, and the budget for the year, not including building operations, was more than \$680,905. There were 55,128 volumes in the library. In 1932 the college received approximately \$30,000 in miscellaneous gifts. A new dormitory, Windham House, housing 71 students, was opened in September, 1933. An outdoor theatre, the gift of Frances Buck, 1932, and her mother of Evanston, Ill., was opened in 1933. President, Katharine Blunt, Ph.D.

CONNETT, ALBERT NEUMANN. An American civil engineer, died in New York City, Jan. 1, 1933. He was born at Bethal, Conn., July 12, 1859, and was graduated from the Rensselaer Polytechnic Institute in 1880. Early achieving a reputation as a transportation engineer with the Washington and Georgetown Railway, the Baltimore Traction Co., and the Baltimore City Passenger Railway Co., he became in 1894 chief engineer of the Metropolitan Street Railway Co. of Washington, installing in that city the first successful underground electric conduit for street railways in the United States. In 1896 he was employed by the Thomson-Houston Co., the French affiliate of the General Electric Co., to install the same system in Paris, adapting it to local conditions by utilizing the side slot type of conduit. In 1900 he became chief engineer and managing director of the London branch of J. G. White and Co., designing and installing for that company not only such tractions projects as the 24-mile centre slot conduit system in London but water-power and electric light and power plants in most parts of the British Empire.

Mr. Connett remained in London until his retirement from active practice in 1921. During the early months of the World War he organized, as a member of the Belgian Relief Commission, the distribution in the devastated parts of Belgium and France of food supplies received from the United States. The Belgian government made him an officer of the Order of Leopold in recognition of this service.

CONTRACT BRIDGE. The game of Contract Bridge increased in popularity in 1933, thousands becoming converted by the incessant conversation of those who had previously taken up the game. In increasing popularity the year was on a par with 1932, but several changes were noticed. For one thing, there was much less talk about systems and the ensuing arguments and attendant publicity for the protagonists of this or that system. The year was an extremely lean one for the publishers and writers who had discovered bridge as a money maker in 1931 and 1932,

but daily columns of instruction were still carried in almost every newspaper in the United States.

The year marked the rise of several hitherto "unknowns" to the rank of experts, and the eclipse of some of those who had been regarded unbeatable in other years. The falling of crowned heads started with the first major event of the year, when Frederick C. Bailey and Mrs. Grace E. Perpall, of the Cavendish Club, regarded as excellent players but hardly of championship calibre, won the Julian Goldman Trophy for pairs. Ely Culbertson, easily the most highly publicized expert, played in only one United States tournament but staged several matches abroad and added to his fame. In a match of plafond, the French equivalent of contract, played at Paris, the game broke up in disagreement before the final boards were played.

In the International contest for the Charles M. Schwab Trophy, the American team of Mr. and Mrs. Culbertson, Michael T. Gottlieb, and Theodore Lightner won from the British four by 10,900 points in a match played in a London department store. More than 27,000 spectators watched the play through the week. The English customs authorities refused to admit the Schwab Cup into England without payment of 30 per cent duty, and the trophy remained in the United States.

David Burnstine excelled in the American Bridge League summer tournament at Asbury Park, N. J., winning the Shepard Barclay Trophy for mixed team of four with Edwin Wetzlar, Mrs. Marguerite Stengel, and Mrs. Elinor Murdoch as his partners, and taking the masters match for the Waldemar Von Zedtwitz trophy with Howard Schenken. He was also on the team-of-four championship team with Schenken, Oswald Jacoby, and Richard L. Frey. A month later Burnstine captured the individual masters championship in New York, topping Miss Murdoch by five and a half match points.

The Harold S. Vanderbilt team of four competition went to Frank Rendon, Benjamin Feuer, Phil Abramsohn, and Sidney Rusinow. Charles Q. Hall and R. M. Wildberg of Cincinnati won the open pair championship in the American Bridge League winter session at Cincinnati and another Cincinnati team of Hall, Wildberg, Albert Steiner, and Phil Steiner defeated quartets led by Jacoby and P. Hal Sims for the team of four championship.

CONTRACTS. See *LAW*, under *Private Law*.

CONWAY, ROBERT SEYMOUR. A British classical philologist, died in London, Sept. 28, 1933. Born at Stoke Newington in 1864, he attended Caius College, Cambridge, where he was fellow during 1888-93. He then became professor of Latin at University College, Cardiff, Wales, and in 1903 accepted the Hulme chair of Latin at Victoria University, Manchester, where he remained until his retirement in 1929. During his later years he held several lectureships, delivering a series on the Vergilian age at Harvard University in 1927 and serving as Wilding lecturer at Christchurch College, New Zealand (1928), Charles Eliot Norton lecturer to the American Institute of Archaeology (1930), classical lecturer to the University of California (1932), and Hibbert lecturer (1932). He served also as governor of the British Institute of Florence, and in 1918 was elected fellow of the British Academy and in 1927 president of the Classical Association.

Dr. Conway approached philology as a means to the comprehension of the entire culture of the

Hellenic and Italic peoples, setting forth the results of his research in such works as *New Studies of a Great Inheritance* (1921); *Poetry and Government* (1928); *Great Writers of Rome* (1930); *Makers of Europe* (1931); and *Etruscan Influence on Roman Religion* (1932). Noteworthy among his books dealing with the structure of the classical languages were *Verner's Law in Italy* (1887); *The Restored Pronunciation of Greek and Latin* (1896); *The Italian Dialects* (1897); *Dialectorum Italicorum Exempla* (1898); *The Messianic Eclogue of Vergil* (1907); *The Making of Latin* (1923); and *The Pre-Italic Dialects* (1933). He collaborated also in the translation of Brugmann's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (1888-95) and with Prof. C. F. Walters wrote *Limen, a First Latin Book* (1908) and *Deigma, a First Greek Book* (1916).

COOLIDGE, CALVIN. An American statesman and the thirtieth president of the United States, died at Northampton, Mass., Jan. 5, 1933. Born at Plymouth, Vt., July 4, 1872, he attended the Black River and St. Johnsbury Academies and was graduated in 1895 from Amherst College. He studied law with the firm of Hammond and Field in Northampton, and on his admission to the Massachusetts Bar in 1897 practiced during the next 20 years in that city. His office-holding career began in 1899 when he was elected a councilman of Northampton. He was thereafter city solicitor (1900), clerk of the courts (1904), member of the House of Representatives of the General Court of Massachusetts (1907-08), and mayor of Northampton (1910-11). Elected to the State Senate in 1912, he served until 1915, being president of that body during his last two terms. In 1916, 1917, and 1918 he was elected Lieutenant-Governor of Massachusetts, and in 1919 and 1920 Governor.

As Governor, Coolidge proved to be an expert administrator, influencing in particular the passage of various laws by which there was effected a reorganization of the executive and administrative functions of the State government. He became nationally known through his intervention in the Boston police strike of September, 1919, considered the first open move in a nation-wide programme to organize, under the American Federation of Labor, the police of all cities. As a result of his decisive action in calling out the State militia, and thereby preventing serious rioting and ending the strike, he was hailed throughout the nation as a strong champion of law and order. His declaration that "there was no right to strike against the public safety by anybody, anywhere, any time" won for him the nomination for the Vice-Presidency at the Republican National Convention in Chicago in 1920. After his inauguration President Harding established a new precedent by inviting the Vice-President to become an *ex-officio* member of the Cabinet. This not only enabled Coolidge to act as liaison officer between the President and the Senate but gave him a familiarity with the duties of the President and his Cabinet that no other Vice-President possessed.

On the death of Warren G. Harding on Aug. 2, 1923, Calvin Coolidge became the thirtieth President of the United States, the oath of office being administered to him at Plymouth, where he was spending his vacation, by his father, Col. John C. Coolidge, a justice of the peace, at 2.47 o'clock in the morning of August 3. He announced

that he would follow in general the policies of his predecessor. During the winter of 1923-24 the Senate was engaged with its startling investigations into the circumstances under which naval oil reserve lands had been leased to private interests, the conduct of the Veterans' Bureau, and the administration of the Department of Justice and the Office of the Alien Property Custodian. Despite the forced resignation of Albert B. Fall, Secretary of the Interior, and the friendly resignations of Edwin Denby, Secretary of the Navy, and Harry M. Daugherty, Attorney-General, the Coolidge administration was not entirely saved from embarrassment. Congress proved more and more independent of the President's leadership, passing over his veto the Soldier Bonus Bill, which granted insurance policies and cash payments, amounting ultimately to \$2,250,000,000, to more than 3,000,000 veterans of the World War, and refusing to accede to his request in regard to postponing the operation of the Japanese exclusion provision of the Immigration Bill, regardless of the "gentlemen's agreement" between the Japanese and American governments under which the former had prevented for many years the emigration of laborers to the United States.

At the Republican National Convention in Cleveland in 1924 Coolidge was nominated as candidate for the Presidency to succeed himself and was elected on November 4, obtaining 382 electoral votes from 35 States. His second administration marked the great era of American prosperity. He was especially in sympathy with the policies of Herbert Hoover, then Secretary of Commerce, for developing greater efficiency in production, and for stimulating foreign trade through the coöperation of business and government, and with those of Andrew W. Mellon, Secretary of the Treasury, for the reduction of taxes on higher incomes so as to release additional capital for investment in industry. Through a reduction in Federal expenditures from \$3,697,478,000 in 1923 to \$3,493,584,000 in 1927 the national tax burden was alleviated four times during his administration, its most important form being that of a reduced income tax. The public debt was also reduced from \$22,500,000,000 to \$17,600,000,000 by applying surplus revenues to debt retirement and by using sinking fund accumulations. As a revenue-producing measure Coolidge upheld the traditional Republican policies regarding the tariff and opposed any projected plans for its revision. In 1927 he vetoed the McNary-Haugen Farm Relief Bill, because he regarded its price-fixing stipulations, the so-called equalization fee for paying the expenses of farm crop marketing, as economically unsound.

Coolidge's foreign policy was marked by opposition to the cancellation of war debts owed to the United States government, and during his administration debt-funding agreements were reached with Italy, Belgium, Yugoslavia, and other European borrowers. Also, he exerted a profound influence upon Latin-American affairs. From 1925 to 1928 he was engaged with the attempted settlement of the long-standing boundary dispute between Peru and Chile over the possession of Tacna-Arica, the arbitration of which had been inherited from the Harding administration. In March, 1925, he decided that the sovereignty of the territory should be determined by a plebiscite and appointed Gen. John J. Pershing as

head of a commission to conduct the vote and fix the boundary. Three years later he brought about the resumption of diplomatic relations between the two governments after 17 years of non-recognition. In 1927 his appointment of Dwight W. Morrow as Ambassador to Mexico resulted in greatly improved relations between that country and the United States.

In his message to Congress in December, 1925, President Coolidge made a strong plea for American adhesion to the protocol creating the Permanent Court of International Justice. The Senate sanctioned this adhesion on Jan. 27, 1926, on condition that the United States should not be bound by advisory opinions rendered without its consent, but in November of that year a deadlock was reached when the President refused to submit to it a counter-reservation proposed by the conference of participating members of the Court. Coolidge lent his support to the Kellogg-Briand Peace Pact, which originated with Aristide Briand, the French Minister of Foreign Affairs, as a treaty renouncing war as an instrument of national policy between France and the United States and was extended by Frank B. Kellogg, the American Secretary of State, as a multilateral treaty of similar intent, accepted by most of the nations of the world. After this support he was criticized because in an Armistice Day speech on Nov. 11, 1928, he advocated the adoption by Congress of a cruiser-construction programme. In fact, the tenor of most of his speeches after the failure of the Geneva Disarmament Conference was nationalistic.

Coolidge might have received the Republican party's nomination for the Presidency in 1928, but on Aug. 2, 1927, while on a vacation in the Black Hills, he announced that he did not "choose to run for President in 1928," thus observing the third-term tradition. At the conclusion of his term in 1929 he returned to Northampton, where he devoted himself to writing magazine and newspaper syndicate articles on his life and various aspects of the Presidency. Also, he served as a director of the New York Life Insurance Co. and was chairman of the National Transportation Committee, engaged in making a survey of the railroads of the United States with a view to their rehabilitation and the protection of their stockholders. In addition to the *Autobiography of Calvin Coolidge* (1929) he published two collections of speeches, *Have Faith in Massachusetts* (1919), and *The Price of Freedom* (1924). These reflected the Yankee qualities that endeared him to the American people—conservatism, frugality, and common sense.

COÖPERATION. COÖPERATION DURING THE DEPRESSION. As these columns have previously pointed out, the coöperative movement has shown amazing vitality throughout the world despite large-scale unemployment, decline in purchasing power, and the inability of so many agricultural coöperatives to sell their wares at fair prices. The attached table taken from the *Review of International Cooperation*, published in London, gives the per cent of rise or fall in the sales of coöperative wholesale societies as compared with the index numbers of wholesale prices in 1930 and 1931.

It will be noted that a number of societies have recorded increases in turnover despite the falling price level; that in others turnovers were falling less rapidly than wholesale prices; while in a few, turnovers were falling more rapidly than

the price level. In fact in about two-thirds of the societies, progress continued to be made in spite of the depression. The Belgium F. S. C. during the first six months of 1932 did a business of 87,569,255 francs which was a decrease of 6,380,804 francs over the first half of 1931; the Finland O. T. K. did a business of 263,000,372 marks which was an increase of 5,143,397 over the first half of 1931; the German G. E. G. did a business of 384,141,930 marks which was a decrease of 7,024,658 over the first half of 1931; the France M. d. G. did a business of 394,291,372 francs which was an increase of 9,284,281 over the first half of 1931; the Germany G. E. G. did a business of 165,000,000 marks which was a decrease of 41,000,000 over the first half of 1931; the Great Britain C. W. S. did a business of £39,953,630 which was a decrease of 182 over the first half of 1931; the Great Britain S. C. W. S. did a business of £8,161,811 which was a decrease of £85,127 over the first half of 1931; the Holland "Handelskamer" did a business of 8,393,055 florins which was an increase of 40,590 over the first half of 1931; the Norway N. K. L. did a business of 14,415,883 kroner which was an increase of 600,690 over the first half of 1931; the Sweden K. F. did a business of 72,500,000 kronor which was an increase of 3,300,000 over the first half of 1931; and the United States Farmers' Union State Exchange (Omaha, Nebraska) did a business of \$680,115 which was a decrease of \$283,610 over the first half of 1931.

UNITED STATES. A study made by the Bureau of Labor Statistics of some 90 societies in the United States indicated the following: in 50 retail distributive societies, sales during 1932 totaled \$6,000,000 and in 36 of these there was a net surplus for the year's trading operations of \$80,000 as against an aggregate loss of \$43,000 for 11 others. The 35 cooperative oil associations included realized a net gain of \$168,255 and not one showed a loss. Sales in excess of \$4,000,000 were made by the three wholesale societies reporting to the Bureau, all showing gains in the year's business. The Bureau of Labor Statistics

declared that it had been advised by the Coöperative League that while many of the consumers' coöperative societies in the United States were hard pressed, there had been "almost no failures among consumers' coöperative societies due to the depression."

The Bureau of Labor Statistics in the October issue of the *Monthly Labor Review* presented the results of an inquiry regarding the 1932 operations of 1472 out of the 1612 coöperative credit societies working in 42 States. These had a combined membership of 301,119, share capital totaling \$21,708,328, and a guaranty fund to cover bad debts amounting to \$2,110,815. The combined assets of the societies in the 23 States for which information was secured came to \$31,416,072. The 1345 societies for which returns were made as to the number of borrowers had served 161,941 persons, while those reporting loans granted during the year had disbursed \$16,375,952. This was an average of \$16,475 per society and an average loan of \$156. Nearly \$25,000,000 in loans was outstanding at the end of the year. Massachusetts led the States in the amount of share capital and total resources. In this State there were 285 credit unions with a membership of 102,423 persons, a share capital of \$7,161,347, a guaranty fund of \$856,840, and total resources of \$12,521,153. New York, which came second, had a total of 113 credit unions with a membership of 50,719, total share capital of \$5,655,309, a guaranty fund of \$789,005, and total resources of \$7,563,528. Illinois, which came third, had a total of 108 credit unions, a membership of 22,802, share capital of \$1,215,822, a guaranty fund of \$73,936, and total resources of \$1,363,975. Missouri, which had not a single credit society in 1929, had by the end of 1932, 122 societies with a total membership of 13,467, and a share capital of \$837,154. The largest number of loans made was in Massachusetts where more than 50,000 persons were aided in this way during the year. More than \$500,000 was returned to members in dividends by the 990 societies of which reports were received. In addition members who were borrowers also benefited by the low rate of interest charged which was usually 1 per cent per month computed on the unpaid balance only. The following table shows the comparative development of credit unions in 1929 and 1932:

Item	1929	1932
Total number of societies . .	974	1,612
Number reported for	838	1,472
Membership:		
Total	264,908	301,119
Average per society	320	216
Share capital:		
Amount	\$24,065,407	\$21,708,328
Average per member	\$92	\$70
Guaranty fund	\$2,079,450	\$2,110,815
Loans during year:		
Total	\$24,548,353	\$16,375,952
Average per society	\$58,310	\$16,475
Average per loan	\$350	\$156
Loans outstanding at end of year	\$30,811,582	\$24,826,291

While the number of societies in operation nearly doubled over the period and the aggregate membership rose about 14 per cent, there was a decline of over \$8,000,000 in the amount of loans granted.

The number of postal credit unions among postal employees increased from 275 to 298 during 1932, the membership rose from 49,037 to

57,636, and the total assets from \$5,078,874 to \$6,167,546. The guaranty funds reported a total of \$251,066, and the undivided earnings totaled \$300,460. The total number of cumulative loans at the end of 1932 was 248,125 and the amount loaned in all was \$29,030,732, of which bad loans during the whole history of these organizations had been but \$4271.

FARMERS' COÖPERATIVES IN 1929. The census figures recently published show the history of co-operative agriculture in 1929 as compared with 1924 and 1919. In 1929, 13.1 per cent of all the farm operators in the United States reported dealings with co-operative organizations. Half of these sold their crops through marketing organizations, while the number who confined their co-operative dealings to the purchase of farm supplies formed only 2.1 per cent of the total. The figures in the following table represent only the patrons and not necessarily the membership of co-operative associations, such societies also doing business with and for non-members.

In 1929 the proportion of farmers making co-operative sales dropped below the 1924 level

dairy products societies which had a membership of 68,111. Altogether there were in Canada 1125 co-operative associations with a total membership of 524,965. Central organizations include the following: one consumers' society with 42 affiliated organizations belonging to it; one live marketing society with 324 affiliated organizations; and one wool marketing society with 17 affiliated organizations.

COÖPERATIVE PRODUCTIVE FEDERATION OF GREAT BRITAIN. Workers' productive societies have made considerable headway in Great Britain, Italy, and Russia. While the co-operative workshop owned and operated by the workers themselves is not nearly as important in Great Britain as the great consumers' co-operative societies, nevertheless this type of activity has been successful in furnishing employment to an increasing number of persons. Productive co-operation, too, has held its ground during the depression, the work of the Cooperative Productive Federation established in 1882 being as much responsible as any single agency. The federation acts as a clearing house for information for its member societies and also

Item	1919		1924		1929	
	Number or amount	Per cent of all farms	Number or amount	Per cent of all farms	Number or amount	Per cent of all farms

Farms reporting cooperative—						
Sales only	295,078	4 6	624,631	9 8	413,623	6.6
Purchases only	113,144	1 8	103,169	1 6	132,642	2.1
Sales and purchases	216,305	3.4	259,576	4.1	278,272	4.4
Total	624,527	9.7	987,376	15.5	824,537	13.1
Value of all farm products					\$2,138,048,366	100.0
Value of products sold cooperatively	\$721,983,639	\$858,284,887	\$892,481,491	41.7
Value of goods bought cooperatively	\$84,615,669	\$75,971,169	\$125,048,597

though it was still greater than that of 1919; those making purchases only declined from 1919 to 1924 but rose even above the 1919 level in 1929. The money value of the farm products sold through co-operative organizations showed a continuous increase. More than two-fifths of the farm products of the entire United States were marketed co-operatively in 1929. The value of goods bought through farm co-operative stores increased 64.6 per cent in 1929 as compared with 1924. Part of these purchases were for consumers' goods (food, clothing, fuel, etc.) and part were for commodities used in the business of the farm (fertilizer, seed, feed, twine, machinery, etc.). In 1929 the average value per farm of products marketed co-operatively was \$1290; the average value of supplies bought was \$304. Minnesota during the three census years held first place among the States in the percentage of farms reporting co-operative sales, the percentages being 43.9 in 1919, 42.4 in 1924, and 51.6 in 1929. As regards co-operative purchasing, Nebraska led in 1919 with 22 per cent of all farm operators buying supplies co-operatively, Iowa led in 1924 with 15.9 per cent, and Minnesota led in 1929 with 21.4 per cent.

CANADA. In 1931 there were 466 consumers' societies in Canada with a total membership of 49,110; 13 credit and savings societies with a membership of 48,254; and 92 community halls with a membership of 5749. There were also 477 co-operative marketing associations whose membership totaled 374,516. The seed and grain societies among the latter had a membership of 192,809 and next in order numerically were the

supplies educational, joint invoicing, accountancy, and technical services and issues a number of publications. The problem of marketing in Great Britain, is comparatively simple for the workers' productive societies have as their chief outlet the great wholesale consumers' co-operative organizations. Over the period 1923-31 the following has been the statistical record of the societies belonging to the Cooperative Productive Federation of Great Britain: number of societies, decreased from 44 to 43; number of members, increased from 14,313 to 15,187; share and loan capital, increased from £843,391 to £1,076,596; amount of sales, increased from £2,051,987 to £2,635,871; net gain, increased from £77,869 to £127,172.

WORKERS' PRODUCTIVE ASSOCIATIONS OF THE SOVIET UNION. During 1932 the workers' productive associations which were known commonly as "artels," had by the middle of December, 1932, produced goods worth 4,271,000,000 rubles, which was in excess of the quota set for the whole year. During the years 1928-32 the production of these labor artels grew fourfold and their membership increased from 1,004,000 to 2,353,000. Cottage industries were particularly active among this group. Under the second five-year plan, the Soviet government decreed that the entire field of cottage industries was to be organized into labor artels in which the producers as artel members were to work in shops and fields. Their total output was to be increased 28.7 per cent and 71.4 per cent of the goods was to be articles for mass consumption. The membership goal of the labor artels in these indus-

tries was set at 3,833,000. Particular attention was to be given to the organization of such industries in rural districts in collaboration with the giant collective farms. It was also declared, this being a departure from previous practice, that the profits of the artels were to be divided according to the productivity of the various members so that the more efficient workers could receive a larger share.

COÖPERATIVE PRODUCTIVE FEDERATION. See COÖPERATION.

COPPER. Preliminary statistics for 1933 indicated some improvement in the copper industry, according to the United States Bureau of Mines. Domestic requirements continued to be small although withdrawals on domestic account increased about 28 per cent over those in 1932. Refined primary output from domestic and foreign sources was about 11 per cent higher than in 1932. Imports of unmanufactured copper were sharply lower in 1933, decreasing about 30 per cent. Largely due to the tariff on copper, imports of refined copper were less than 7 per cent of those in the preceding year. Exports of metallic copper were relatively the same in 1933 as in 1932. The gains and losses noted were responsible for a decrease of 15 per cent in stocks of refined copper at domestic refineries. A decrease of 4 per cent was also reported in stocks of blister and unrefined copper at smelters, in transit to refineries and at refineries.

The average weekly quoted price of copper (electrolytic, f.o.b. refinery) was 4.775 cents a pound, the lowest quotation on record, from the third week of December, 1932, through the week of Mar. 4, 1933. Then an upward trend took place which, despite minor fluctuations, carried the price to 8.775 cents a pound, the highest quotation of the year, for the first week in August. The price remained at approximately this level for over two months; then it dropped to 7.327 cents a pound during the week of October 21. The price trend was generally upward during the last weeks of the year and the average weekly quotation was 8.025 cents a pound during the last two weeks of December.

The smelter production of copper from domestic ores in 1933 as determined by the Bureau of Mines from reports of the smelters showing actual production for 11 months and estimated production for December, was 477,000,000 lbs., compared with 544,009,948 lbs. in 1932, and was the smallest production recorded since 1896. The estimated smelter production from domestic ores for December, as reported by the smelters, was nearly 40,000,000 lbs. which is approximately the average reported for the 11 months preceding.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 480,600,000 lbs., compared with 445,077,874 lbs. in 1932. The output of new refined copper from domestic and foreign sources in 1933 amounted to about 756,200,000 lbs., compared with 680,867,734 lbs. in 1932—an increase of 75,300,000 lbs. or 11 per cent. The production of secondary copper by primary refineries increased from 120,454,527 lbs. in 1932 to about 150,100,000 lbs. in 1933. Thus the total primary and secondary output of copper by the refineries in 1933 was 13 per cent higher than in the preceding year—a production of about 906,300,000 lbs. being reported for 1933 as compared with 801,322,261 lbs. in 1932.

The imports of unmanufactured copper during

the first 11 months of 1933, according to the Bureau of Foreign and Domestic Commerce, amounted to 250,853,565 lbs. or at a monthly rate of nearly 23,000,000 lbs. This compares with total imports of 391,991,342 lbs. for the entire year 1932, or at a monthly rate of 32,700,000 lbs. Imports in November, 1933, totaled 30,676,575 lbs. The total imports for 1933 showed a decrease of approximately 116,000,000 lbs. for the year, or a drop of about 30 per cent.

The exports of metallic copper during the first 11 months of 1933 amounted to 273,817,517 lbs. as compared with 295,356,719 lbs. exported during the entire year 1932; with an estimated total for the entire year 1933 little different from that for 1932. In the first 11 months of 1933, 220,141,601 lbs. of refined copper in ingots, bars, and other forms, and 15,295,295 lbs. of rods were exported. Of the total quantity France received 65,335,069 lbs., the largest amount. Germany was next with 28,676,819 lbs.; Italy was third with 26,699,630 lbs.; and the United Kingdom fourth with 24,532,385 lbs. In the entire year 1932 the United Kingdom received the largest quantity, 68,344,096 lbs.; France was next with 65,306,278 lbs.; Germany was third with 30,806,376 lbs.; and Italy fourth with 23,344,238 lbs.

Refineries reported that at the end of 1933 approximately 851,000,000 lbs. of refined copper would be in stock, a 15 per cent decrease from the reserve of 1,004,000,000 lbs. at the end of 1932. It is estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, would be about 362,000,000 lbs. on December 31, compared with 378,000,000 lbs. at the end of 1932, a decrease of 16,000,000 lbs. or 4 per cent. Total smelter and refinery stocks at the end of 1933 were 1,213,000,000 lbs., representing a decrease of 169,000,000 lbs., or 12 per cent, from the record stocks at the end of 1932.

Stocks of refined copper on Nov. 30, 1933 were reported as 856,000,000 lbs., and stocks of blister copper at smelters, in transit, and at refineries were reported as 357,000,000 lbs.

The quantity of new refined copper withdrawn on domestic account during the year was about 665,100,000 lbs., compared with 519,200,000 lbs. in 1932, an increase of 145,900,000 lbs. or 28 per cent. The method of calculating domestic withdrawals is shown as follows:

NEW REFINED COPPER WITHDRAWN FROM TOTAL YEAR'S SUPPLY ON DOMESTIC ACCOUNT, 1932-1933, IN POUNDS [U. S. Bureau of Mines estimates]

	1932	1933
Refinery production of new copper from domestic sources	445,100,000	480,600,000
Refinery production of new copper from foreign sources	235,800,000	275,600,000
Imports of refined copper (December, 1933, estimated)	167,800,000	10,900,000
Stocks of new refined copper on January 1	924,600,000	1,004,000,000
Total	1,778,300,000	1,771,100,000
Exports of refined copper (ingots, bars, rods, or other forms) (December, 1933, estimated) ..	250,100,000	255,000,000
Stocks December 31	1,004,000,000	851,000,000
Total	1,254,100,000	1,106,000,000
Total withdrawn on domestic account .	519,200,000	665,100,000

According to an estimate issued by Brandeis, Goldschmidt & Co., London, the world production of copper in 1933 showed an increase of about 4 per cent over that of the preceding year, rising from 870,000 long tons in 1932 to 902,000 tons in 1933. Consumption increased about 16½ per cent in the same period, rising from 985,000 long tons in 1932 to 1,125,000 tons in 1933. Consumption in the United States rose 45,000 tons more than the 300,000 tons consumed in 1932, while in the rest of the world the rise was from 865,000 tons to 870,000 tons. African production in 1933 was estimated at 165,000 tons (127,000 tons in 1932); Canadian output rose from 112,000 tons to 125,000 tons in 1933, and South American production dropped from 126,000 tons in 1932 to 120,000 tons in 1933.

COPYRIGHT. Registrations for the fiscal year, 1932-33, according to the report of the United States Register of Copyrights, numbered 137,424, as compared with 151,735 for the preceding year. Of these, 49,984 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 44,400, those printed abroad in a foreign language, 4232, while the remainder, 1362, were English books registered for *ad interim copyright*. The chief classes of the remaining registrations, the largest in numerical importance, were: Periodicals, 35,464 numbers; musical compositions, 26,846; prints and pictorial illustrations, 3143; photographs, 1882; dramatic or dramatico-musical compositions, 6359; works of art, including models or designs, 2667; maps, 1178; drawings or plastic works of a scientific or technical character, 1495; motion-picture photoplays, 800; and motion pictures not photoplays, 743. The renewals numbered 6411, as compared with 5888 in the preceding year. The fees applied during the year amounted to \$250,995. The total number of articles deposited during the fiscal year ended June 30, 1932, was 216,339.

The gross receipts of the Register's office for the fiscal year were \$280,964; the total expenditure for salaries, \$219,216, and for supplies, \$1018. The year's business was not quite so large as that of the previous year, due no doubt to the general depression affecting all lines of business.

CORBETT, JAMES J. An American boxer, died at Bayside, Long Island, N. Y., Feb. 18, 1933. He was born in San Francisco, Calif., Sept. 1, 1866, and was educated at Sacred Heart College. At the age of 18 he took up boxing, but his first major contest was with Joe Choynski on June 5, 1889, on a barge in San Francisco Bay. The bout lasted 28 rounds, resulting in a knockout by Corbett. After several minor victories, he fought the Negro heavyweight, Peter Jackson, at San Francisco on May 21, 1891. The fight lasted 61 rounds, and though declared a draw by the referee was regarded as a victory for the young boxer. A year later, on Sept. 7, 1892, he met the world's champion, John L. Sullivan, at New Orleans, and in a superb exhibition of boxing that lasted into the twenty-first round achieved a knockout that gave him the championship. He held the title against all challengers until Mar. 17, 1897, when he met Bob Fitzsimmons at Carson City, Nev., and was knocked out in the fourteenth round.

After James J. Jeffries had defeated Fitzsimmons in 1899, Corbett made two attempts to wrest the title from the new champion; but at

each attempt—in 23 rounds at Coney Island, N. Y., on May 11, 1900, and in 10 rounds at San Francisco on Aug. 14, 1903—he was defeated, and withdrew from the ring after the last encounter. Thereafter he appeared on the stage, in vaudeville, in motion pictures, on the lecture platform, and before the radio. His sobriquet, "Gentleman Jim," came from his natty appearance and gentlemanly behavior at a time when boxing was a ruffianly profession.

CORN. The estimated yields of corn in 1933 of 18 countries reporting to the International Institute of Agriculture amounted to 2,970,298,000 bushels as compared with 3,701,677,000 bushels in 1932, and 3,133,211,000 bushels, the average annual production for the five years 1927-1931. The yield of these countries in 1933 was about 80 per cent of the preceding year's crop and approximately 95 per cent of the average annual production of the five-year period. For the countries reporting, the area in corn in 1933 estimated at 134,777,000 acres was over 3 per cent below the area in 1932, and approximately 3 per cent above the average annual area of the five years mentioned. The production in 1933 of the leading corn producing countries of this group not including the United States was reported as follows: Rumania 185,032,000 bushels, Yugoslavia 143,916,000 bushels, Italy 92,858,000 bushels, Egypt 77,854,000 bushels, and Hungary 69,104,000 bushels. The estimate of the Italian yield does not include the quickly maturing crop known as "cinquantino" of which 8,159,000 bushels were produced in 1932. The average annual yield of the Soviet Republics for the five years 1927-31 was estimated at 140,000,000 bushels and the area at 8,300,000 acres. The area planted in 1933 was reported as 9,000,000 acres or about 15 per cent above the five-year average. The production of Argentina in the crop year 1932-33 was reported as 250,000,000 bushels. The Canadian crop in 1933 was estimated at 4,658,000 bushels as compared with a yield of 5,057,000 bushels in 1932. While the world's corn production in 1933 was much lower than the yield in 1932 the residual stocks of the 1932-33 crop in Argentina and the surplus available in Rumania, Bulgaria, Yugoslavia, and Hungary were considered adequate to meet international requirements.

The estimated production of corn in the United States in 1933 as reported by the Department of Agriculture was 2,330,237,000 bushels while in 1932 the crop was 2,906,873,000 bushels, or greater by 586,456,000 bushels. The average annual yield for the five-year period 1926-30 was 2,512,000,000 bushels. The area devoted to the crop in 1933 was 102,239,000 acres, in 1932, 108,668,000 acres and the annual average for the five years 99,328,000 acres. The 1933 average yield per acre, 22.8 bushels, was 4 bushels less than that of the preceding year and 12.6 per cent below the average of 26.1 bushels for the 10 years 1921-1930. The estimates of productions included the entire acreage regardless of what use was made of the crop, the yield being expressed in equivalent bushels of ear corn.

The yields of the leading corn producing States including all methods of harvesting such as cutting for silage or fodder, pasturing with hogs, etc. were reported as follows: Iowa 439,951,000 bushels, Nebraska 234,698,000 bushels, Illinois 224,748,000 bushels, Minnesota 142,957,000 bushels, Missouri 141,446,000 bushels, Indiana 125,-

906,000 bushels, and Ohio 112,694,000 bushels. These States produced 61 per cent of the total production reported for the 48 States. The average yield per acre of the States mentioned ranged from 25.8 in Nebraska to 39 bushels in Iowa and in the remainder of the States from 7 bushels in Oklahoma and South Dakota to 44 bushels in Rhode Island.

During the fiscal year ended June 30, 1933 the United States exported 8,193,000 bushels of corn, 146,000 barrels of cornmeal, 1,299,000 pounds of corn breakfast foods, 12,280,000 pounds of hominy and corn grits, and 901,000 pounds of corn oil. The imports for the year amounted to 195,000 bushels, or less than half the quantity imported in 1932. The crop of 1933 was little if any larger than required for domestic needs. Corn products used in the manufacture of fermented liquors before prohibition went into effect were equivalent to about 15,000,000 bushels of corn.

A study made by the Department of Agriculture showed that the average cost of producing an acre of corn in the United States in 1932 was \$13.08 including rent and \$9.49 not including rent. The average cost of producing a bushel was 49 cents. Of the total gross cost per acre labor and power took up about 47 per cent; fertilizer and seed, 11 per cent; land rent, 26 per cent, and other items 16 per cent. The net cost per bushel, including rent, varied from 34 cents in Illinois and Iowa to 94 cents in the southeastern States, the difference being due largely to the difference in the average yield per acre. In general the land rent amounted to 10 to 15 cents per bushel of corn. The tenth annual National Corn Husking Contest was held in November near West Point, Nebraska. The winner of the national championship, Sherman Henriksen of Nebraska, husked 27,024 bushels, after deducting for gleanings and husks, in the allotted period of 80 minutes. Harry Brown, also of Nebraska, ranked second with 25,275 bushels. A crowd exceeding 55,000 was reported to have witnessed the contest.

CORN BORER. See ENTOMOLOGY, ECONOMIC.

CORNELL UNIVERSITY. A nonsectarian institution for the higher education of men and women at Ithaca, N. Y., founded in 1865. There were 5671 students enrolled in the autumn session of 1933, distributed as follows: Graduate school, 648; law school, 185; medical college, the main division of which is in New York City, 270; arts and sciences, 1840; architecture, landscape architecture, and fine arts, 152; engineering, 847; veterinary medicine, 165; agriculture, 1010; and home economics, 614, including 157 in hotel administration. Of these students 1341 were women. The registration for the 1933 summer session was 1465.

The faculty, composed of 1204 members, had 312 professors, 210 assistant professors, 18 lecturers and associates, 372 instructors, and 292 assistants. Dr. Kurt Lewin of Berlin was added to the staff as acting professor of education. The faculty lost by death John Bentley, Jr., professor of forest engineering; Isaac J. Furman, professor of clinical psychiatry; Adam C. Gill, professor of mineralogy and petrography; Othon G. Guerlac, professor of the Romance languages and literatures; Eugene E. Haskell, professor of experimental hydraulics, emeritus; and John L. Stone, professor of farm practice, emeritus. The visiting lecturer in chemistry on the George Fisher Baker foundation was Prof. Otto Hahn, director of the Kaiser Wilhelm Institute of Chem-

istry at Berlin-Dahlem, Germany. The Messenger lectures on the evolution of civilization were given by Prof. B. Malinowski of the University of London.

Buildings completed and occupied during the year were Martha Van Rensselaer Hall, housing the New York State College of Home Economics, and a building for the use of the department of agricultural economics and farm management of the State College of Agriculture.

The productive funds on June 30, 1933, were \$28,490,812. The income applicable to current expenses was approximately \$8,000,000, including \$2,833,697 of State and \$453,631 of Federal appropriations. Gifts amounting to \$3,155,133 were received during the fiscal year. The land and buildings were valued at \$13,582,893, and the equipment at \$5,971,745. The library contained 870,000 volumes. President, Livingston Farrand, M.D., L.H.D., LL.D.

CORONA. See METEOROLOGY.

CORRENS, KARL. A German biologist, died in Berlin, Feb. 15, 1933. He was born in Munich, Sept. 19, 1864, and attended the Universities of Munich, Prague, Tübingen, and Berlin, receiving the Ph.D. degree from the latter. In 1902 he was appointed professor of botany at the University of Leipzig, and in 1909 joined the scientific faculty at the University of Münster, Westphalia. He remained at Münster until 1914 when he was appointed director of experimental biology at the Kaiser Wilhelm Institute in Dahlem. From 1920 to 1924 he was a member of the philosophy faculty of the University of Berlin.

In 1900 Correns, simultaneously with DeVries of Holland and Tschermak of Austria, brought to light, through his experiments on plant genetics, the law of heredity, which had been announced by Gregor Mendel in 1865 in a paper on inheritance in peas, published in the Proceedings of the Natural History Society of Brünn, and which had remained practically unnoticed for 35 years. In 1932 the Royal Society of Great Britain conferred upon him the Darwin medal for his researches in the field of organic inheritance. His most noted book was *Die neuen Vererbungsgesetze* (1912). He also edited *Biologisches Zentralblatt*.

CORSICA. An island in the Mediterranean, situated approximately 100 miles southeast of the French coast at Nice, constituting a department of France. Area, 3367 square miles; population (1931), 297,235. Chief city Ajaccio, 23,917 inhabitants in 1931.

COSACH. See CHILE.

COSMIC PHYSICS. See PHYSICS.

COSMIC RAY. See CHEMISTRY.

COSTA RICA, kōs'tā rē'kā. A Central American republic. Capital, San José.

AREA AND POPULATION. Costa Rica has an area of 23,000 square miles; the population was estimated at 539,654 on Dec. 31, 1932 (471,524 at the 1927 census). Living births during 1932 numbered 23,661; deaths, 11,843. The estimated population of the chief cities in 1932 was: San José, 57,047; Alajuela, 7571; Heredia, 8256; Limón, 7887; Cartago, 7498. Primary school enrollment (1932) was 50,188 in 513 schools; secondary, 1066; normal, 700.

PRODUCTION. Agriculture is the chief industry and coffee, bananas, and cacao are the main crops, accounting for 98 per cent of the total value of exports in 1932. The quantity and value of the exports of these crops in 1932 was: Coffee,

40,783,000 pounds, \$5,935,000; bananas, 4,313,000 bunches, \$2,451,000; cacao, 7300 metric tons, \$501,000. Corn, sugar cane, rice, potatoes, and tobacco are other crops. Livestock in 1929 included 339,000 cattle, 83,000 swine, and 93,000 horses and mules. Small quantities of gold and silver are mined. Manufacturing is confined to the preparation of a few articles for domestic consumption.

COMMERCE. Imports in 1932 were valued at 23,995,000 colones (\$5,468,000), compared with 34,723,000 colones (\$8,681,000) in 1931. Exports amounted to 37,537,000 colones (\$8,555,000), against 57,117,000 (\$14,279,000) in 1931. (Colones converted at four to the dollar.) Machinery and tools, iron and steel, cotton fabrics, and chemicals were the leading imports. Exports to the United States in 1932 were valued at \$3,362,000 (39.3 per cent of the total), against \$3,281,000 (23 per cent) in 1931; to the United Kingdom, \$4,027,000 (47.1 per cent), against \$8,601,000 (60.3 per cent) in 1931; to Germany, \$633,000 (7.4 per cent), against \$1,572,000 (11.0 per cent) in 1931. Of the 1932 imports, the United States supplied \$2,882,000 (52.7 per cent), against \$4,501,000 (51.8 per cent) in 1931; Germany, \$644,000 (11.8 per cent), compared with \$904,000 (10.4 per cent) in 1931; the United Kingdom, \$297,000 (5.4 per cent), against \$969,000 (11.2 per cent) in 1931.

FINANCE. According to official returns, budget operations for 1931 resulted in a deficit of 2,821,000 colones on expenditures of 27,571,000 colones. In 1932, a deficit of 1,929,000 colones on expenditures of 25,025,000 colones was reported. However credit operations were apparently not included in these totals, the accuracy of which have been questioned (see U. S. *Commerce Yearbook*, 1933, vol. ii, p. 1933). The 1933 budget authorized expenditures of 23,727,000 colones and estimated receipts at 23,766,000 colones. The external public debt on Dec. 31, 1932, included £1,487,734, \$11,098,023, and 5,811,000 francs. The internal funded debt was \$334,000 and 7,216,831 colones; floating debt, 22,405,331 colones. Costa Rica suspended service on the dollar loan of 1926 in 1932 and defaulted on the sterling loan and the dollar loan of 1927 in 1933. Unit of currency, the colon (par. \$0.25; average exchange value in 1932, \$0.23).

COMMUNICATIONS. Costa Rica in 1932 had 430 miles of railway, of which 81 miles (the Pacific Railroad) were government owned. Motor highways extended 161 miles. The Pan-American Airways system touched Costa Rica at Puntarenas. A total of 514 ships of 1,290,853 tons entered the ports in 1931.

GOVERNMENT. Executive power rests in a president elected for four years; legislative power, in a chamber of representatives called the Constitutional Congress. The Congress contains 43 deputies elected for four years, one-half retiring every two years. Voting for President, deputies, and municipal officers is secret and direct. President in 1933, Ricardo Jiménez Oreamuno (Republican National), who assumed office May 8, 1932.

HISTORY. Costa Rica was primarily concerned during 1933 with measures to alleviate the effects of the economic depression. A law of June 2, 1933, prohibited foreclosure suits against debtors, provided they maintained interest payments on their obligations. Interest rates were limited to 6 per cent on secured and 8 per cent on unsecured loans. The law was to be effective until Dec. 31, 1933, during which time salaries of public or

private employees could not be attached if interest payments on obligations were paid. On Dec. 6, 1933, all the provisions of the moratorium law were extended to June 3, 1935.

Another decree of Nov. 22, 1933, fixed a minimum wage for adult laborers of 1 colon (25 cents) per day. It established a council of employers' and employees' representatives to regulate minimum wages in accordance with data on the cost of living, etc., collected by the Secretary of Labor. Agriculture received aid through the laws of July 7 and July 24, 1933. The first of these authorized the issuance of 8,000,000 colones (about \$1,800,000) of 3-per cent mortgage bonds, the proceeds to be loaned to farmers, stock raisers, and the government. The sum of 4,000,000 colones was allotted for long-term agricultural loans secured by first mortgages on real property. Up to 2,000,000 colones was made available for loans to small coffee producers and cleaners; up to 1,000,000 colones to the cattle industry; and up to 1,000,000 colones to the government for urgent public works and highway construction. The bonds were to be retired by means of a cumulative sinking fund.

The law of July 24, 1933, established the Institute for the Defense of Costa Rican Coffee, with authority to control all phases of the coffee business from cultivation of the berry to its final sale. The Institute was to be managed by a board of directors, composed of the Secretary of Agriculture (*ex officio* chairman) and four other members and three alternates appointed by the President. The board was authorized to appoint a technical council of three agricultural experts to develop the scientific phases of the Institute's programme.

The depreciation of the United States dollar following abandonment of the gold standard by the Roosevelt Administration in April, 1933, caused great confusion among the exporters and importers of Costa Rica, whose currency had been stabilized at a ratio of four colones (later changed to four and one-half) to one dollar. The dollar's depreciation benefited Costa Rican exporters, as the chief export (coffee) was marketed mainly in Great Britain and the high exchange value of the pound sterling in terms of colones induced the British to increase their purchases. The importers and merchants, however, were adversely affected by the rising prices of American goods due to dollar depreciation. They demanded a lower exchange rate for dollars, and reinforced their demand with a mutual agreement not to pay any foreign exchange drafts. President Jiménez called Congress in special session on Oct. 2, 1933, to deal with the exchange problem. However, he vetoed a bill submitted to him providing for free exchange within certain limits. A marked upturn in business activity was reported in December.

COST OF LIVING. See STATISTICS.

COTTON. The Crop Reporting Board of the United States Department of Agriculture estimated on Dec. 8, 1933 that the cotton crop for the United States for 1933 would amount to 13,177,000 bales of 500 pounds, compared with 13,002,000 in 1932, and 17,095,000 in 1931. The acre yield of lint was estimated to average 209.4 pounds as compared with 173.3 pounds in 1932 and 167.4 pounds, the average for the period 1922-1931. Of 40,929,000 acres in cultivation July 1, 26.4 per cent were removed from production under Agricultural Adjustment Adminis-

tration contracts and subsequently abandoned on the acreage remaining and 30,144,000 acres were left for harvest.

Estimates were that the world carry-over of American cotton on Aug. 1, 1933, amounted to 11,597,000 running bales compared with 12,961,000 bales in 1932 and 8,868,000 in 1931. The carry-over in the United States was approximately 8,183,000 bales. There were 2,972,000 bales of Indian cotton, 659,000 of Egyptian, and 1,216,000 bales of sundries, totaling 16,444,000 compared with 17,086,000 in 1932. The New York Cotton Exchange estimated the carry-over of all cotton at 16,247,000 bales and production in 1933 at 24,755,000 bales. The world supply of American cotton for 1933-34 was estimated by the United States Department of Agriculture at 24,500,000 bales, about 1,500,000 bales less than the extremely large supplies of about 26,000,000 bales for each of the two previous seasons, but still about 6,000,000 bales larger than the average supply of 18,500,000 bales for the period 1921-22 to 1930-31. The apparent supply of American cotton remaining in the United States on Dec. 1, 1933 was estimated at 15,900,000 bales versus 17,250,000 in 1932.

The areas planted to cotton in 1933 in important cotton growing countries amounted to 68,124,000 acres versus 74,700,000 acres in 1932. Production in 1933 in the countries (reporting) was officially estimated to be, for the United States 13,177,000; India, 4,000,000; U.S.S.R. (Russia) 1,890,000; China, 2,500,000; Egypt, 1,819,000; Brazil, 472,000; Mexico, 223,000; and Chosen (Korea), 147,000 bales. The total world production was estimated at the close of 1933 at 25,500,000 bales versus 23,600,000 in 1932.

The world's production of commercial cotton in 1932 was estimated by the U. S. Bureau of the Census to be 23,634,000 bales, of which the United States produced 12,710,000 (running) bales; India, 4,440,000; U.S.S.R. (Russia), 1,178,000; Egypt, 1,005,000; China, 1,880,000; Brazil, 347,000; Peru, 210,000; Mexico, 95,000; and all other countries, 1,169,000 bales. The International Institute of Agriculture reported the 1932 crops of important cotton growing countries to be, for the United States, 13,002,000; India, 3,779,000; Egypt, 1,027,000; U.S.S.R. (Russia), 1,778,000; Mexico, 95,000; Chosen, 127,000; and Uganda, 243,000. Estimates were that Anglo-Egyptian Sudan produced 120,000 bales from 324,000 acres.

The United States cotton crop for 1932, as reported by the Bureau of the Census, the estimated crop for 1933, and the quantity reported ginned to Dec. 13, 1933, are shown in the accompanying table.

The table includes for 1933, under the ginning report, 568,090 round bales counted as half bales and also 5151 bales of American-Egyptian cotton, practically all grown in Arizona. The 1933 crop of Arizona was estimated to include 12,000 bales of American-Egyptian cotton. The crop of Lower California, usually marketed through California, was estimated at 19,000 bales, not included in the totals.

After the Agricultural Adjustment Act was approved (May 12, 1933), the Adjustment Administration conferred with extension directors in the Cotton States, and growers, manufacturers, and handlers of cotton, who recommended action under the law to eliminate at least 30 per cent of the planted cotton acreage. The programme of co-operation between the Government and growers,

UNITED STATES COTTON CROP, 1932-33

States	Crop, 1933 500-lb. bales	Estimated crop, 1933 500-lb. bales	Reported ginned Dec. 13, 1933 Running bales
United States ...	18,001,508	18,177,000	12,356,769
Alabama	948,854	980,000	947,537
Arizona	69,193	82,000	66,542
Arkansas	1,326,556	1,065,000	994,624
California	129,371	216,000	175,419
Florida	15,151	27,000	28,449
Georgia	854,357	1,110,000	1,084,740
Louisiana	610,509	486,000	467,768
Mississippi	1,179,781	1,180,000	1,126,707
Missouri	308,835	245,000	222,511
New Mexico	69,868	86,000	79,681

Texas	4,501,800	4,475,000	4,115,989
Virginia	31,165	38,000	32,932
All others	14,418	10,000	12,121

announced June 19, provided for (1) a cash payment per acre, varying with prospective yields, to the individual farmer for an agreement to reduce his cotton acreage, and (2) a cash payment per acre plus an option to buy, at 6 cents per pound, a quantity of government-owned cotton equal to the farmer's reduction in output. Estimates were that 1,031,000 producers contracted to withdraw 10,396,000 acres with potential production exceeding 4,300,000 bales. To defray the costs of acreage reduction, the Adjustment Administration announced a cotton processing tax of 4.2 cents per pound, effective August 1, the difference between the farm price June 15 and the fair-exchange value of cotton on that date, to apply to spinning, manufacturing or other processing except ginning. An equivalent tax was also placed on cotton articles in stock August 1 and later compensating taxes were placed on jute, paper, and other fibres competing with cotton. A programme for cotton producers to limit cotton acreage in 1934 to approximately 25,000,000 acres, or a 40 per cent reduction of the 5-year acre average, and to receive about \$125,000,000 in benefit and rental payments, was under way at the close of 1933.

Tangible benefits of the cotton-acreage-reduction programme were evident in the farmers' income from the 1933-34 crop. Besides the \$617,716,000 received (December 1 prices) for the 1933 crop versus \$317,861,000 in 1932, rental payments totaling \$111,528,000 were distributed and farmers who participated in the emergency programme of last summer received some \$48,000,000 in option profits. The income from cottonseed in 1933 was estimated at \$79,532,000 compared with \$53,627,000 in 1932, making the gross income from the 1933 cotton crop \$856,776,000 compared with \$425,488,000 in 1932.

The oil mills in the United States, during the cotton year ended July 31, 1933, crushed 4,620,558 tons of cottonseed. The products of the seed included 741,401 bales of lint, 1,312,435 tons of hulls, 2,093,168 tons of cake and meal, and 1,445,681,407 pounds of oil.

Exports of cotton and lint, for the year ended July 31, 1933, amounted to 8,419,399 running bales of cotton and 183,810 bales of lint, or a total of 8,603,209. The principal exports of cotton were to Germany, 1,848,864; United Kingdom, 1,491,853; France, 863,832; Italy, 803,857; Spain, 312,073; Belgium, 182,612; other European countries, 574,472; Japan, 1,743,302; China,

300,511; and Canada, 176,374. The United States during the same period, imported from Egypt, 67,800 bales; Peru, 6053; China, 50,788; British India, 4895; and from other countries, 893 bales.

The consumption of all cottons in the United States increased nearly 1,270,000 bales in 1932-33 or to 6,135,525 bales compared with 4,866,016 bales in 1931-32. The cotton used by American mills was consumed largely in the cotton-growing States, 5,086,383 bales versus 882,759 in New England and 166,383 in other States. Of 30,938,340 spindles in place Dec. 31, 1933, 24,840,870 were active during December, of which 17,338,794 were located in Cotton States, 6,815,136 in New England, and 686,940 in other States. The number of active spindle hours averaged in Cotton States 198, in New England 110, and elsewhere 111.

The world's consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1933, according to the United States Bureau of the Census, was about 24,986,000 bales. Reports of the International Federation of Master Cotton Spinners' and Manufacturers' Associations indicated it to be 24,332,000 bales compared with 22,319,000 in the previous year. The estimate of the New York Cotton Exchange Service was about 24,725,000 bales versus 23,007,000 in 1931-32. The world consumption of all growths in 1932-33 was an increase of 2,013,000 bales over 1931-32. The increase in consumption of American cotton, which amounted to 1,851,000 bales, accounted for practically all of the increase in the total consumption of all growths. While consumption of sundries cotton in 1932-33 increased 794,000 over the previous season, the gain was largely offset by the decline of 588,000 bales in the consumption of Indian and 44,000 bales of Egyptian. The consumption of the different growths included American cotton, 14,167,000, Indian cotton, 4,200,000, Egyptian cotton, 936,000 bales, and sundries cotton, 5,029,000 bales. The total consumption of all cotton in Europe in 1932-33 was reported at 8,900,000 bales versus 8,700,000 in the previous year; in Japan, 2,900,000; and in China, 2,600,000.

The average price of middling $\frac{3}{8}$ -inch cotton at the 10 spot markets averaged 7.15 cents per pound during the year ended July 31, 1933 compared with 5.89 in 1931-32, 9.61 in 1930-31, and 15.79 cents in 1929-30. The lowest point reached was 5.45 cents on December and the highest 11.51 on July 18. Prices averaged 6.01 cents in January, 1933, 5.85 in February, and 6.19 in March. During the banking holidays in March, 1933, prices advanced more than 1 cent per pound, but reacted later in the month. They advanced markedly in April (6.84), May (8.49), June (9.28), and July (10.52 cents average) to the 11.51 cent peak. The price advance was attributed to lower exchange value of the dollar, the agricultural adjustment programme, increased domestic and foreign mill activity, and improved business sentiment. Advances in terms of gold were considerably less than in terms of currency. A considerable fluctuation with decline in prices occurred after late July and was attributed to fluctuation in the exchange value of the dollar. Prices in August averaged 9.24, September 9.19, October 9.16, November 9.65 and closed on December 29 at an average of 10.08 cents in the 10 spot markets and 10.3 New York. The average prices received by producers at local farm markets on Dec. 15,

1933, were estimated at 9.6 cents per pound for lint and \$15.35 per ton for cottonseed compared with 5.4 cents and \$8.87, respectively, on Dec. 15, 1932.

The condition of the cotton crop in the United States on August 1 approximated 74.2 per cent of normal compared with 65.6 in 1932. Growing conditions were particularly favorable in Atlantic Seaboard States, where the crop was early, well fruited and boll weevil were less active than usual, while in the central part of the Cotton Belt, Texas and Oklahoma, conditions were not so favorable but still were above average. Dry, hot weather in June greatly reduced potential damage from boll weevil. During August, prospects declined in the eastern part of the belt due to weevil activity and unfavorable weather, but losses there were more than offset by increases in the western part of the belt, especially in Texas, Oklahoma, and Arkansas due to favorable weather. Conditions in September were unusually good for maturing late bolls, the crop maturing in most of the belt and similar conditions generally prevailed during October, and picking and ginning made good progress with minimum field losses.

The boll weevil threatened heavy damage in the spring of 1933 on the basis of heavy hibernation in the fall of 1932 and spring survival in 1933, but excessive heat and drought in June and July over much the cotton area greatly checked weevil development and serious infestation was spotted and limited to areas of localized rains. The weevil had about reached the northern limits of cotton culture. Eradication of the pink bollworm from the Salt River Valley of Arizona appeared to be successful and the area was released from quarantine restrictions, although three counties in southeastern Arizona remained under control. Additions to the regulated areas, effective Dec. 23, 1933, included two counties in New Mexico, part or all of seven in Texas, one in Florida, and part of three counties in Georgia. An area in southeastern Arizona was also under *Thurberia* weevil quarantine. Research and quarantine agencies of the Cotton States and the United States Department of Agriculture continued to study control measures for these pests, cotton fleahopper, bollworm, and other insects attacking cotton. See ENTOMOLOGY, *Economic*.

Cotton of the 1933 crop ginned up to Dec. 1, 1933, was lower in grade and longer in staple than that ginned up to Dec. 1, 1932, according to a report based on the 12,103,400 bales of American upland cotton reported by the Census Bureau as ginned prior to that date. Estimates were that 34.7 per cent was white strict middling or better, 24.1 per cent middling, about 11 per cent white strict low middling and below, and about 30 per cent spotted, stained, and yellow tinged cotton, over twice as much as in 1932. There were larger proportions of $\frac{15}{16}$, 1, and $\frac{13}{16}$ inch, with smaller proportions of cotton shorter than $\frac{7}{8}$, $\frac{11}{16}$, and $\frac{11}{8}$ inch. About 94.5 per cent of the cotton ginned up to December 1 was tenderable.

The Universal Cotton Standards Conference held its fifth biennial session in Washington in March, 1933, and approved copies of the universal standards for American cotton for use during the next two years by the United States Department of Agriculture and by arbitration appeal committees of the principal cotton associations.

The International Cotton Congress, held in

Praha and Carlsbad, June 7-10, 1933, considered the causes of depression in the world cotton industry and remedial measures and future trading and its effects on the marketing of cotton and cotton goods. The next congress was planned to convene in 1935 in Milan.

The cotton crops in the principal producing countries in the British Empire, excluding India, in 1931-32 were estimated to be for Anglo-Egyptian Sudan, 205,991 bales; Uganda, 168,000; Nigeria, 5144; Tanganyika, 8970; Union of South Africa, 2342; Australia, 4975; West Indies, 2524; Southern Rhodesia, 1046; Kenya, 1452; Nyasaland, 5087; and Cyprus, 1194. In India, 3,779,000 bales were reported for 1932-33, and 3,368,000 for 1931-32. The crop expected from the acreage planted and conditions in December, 1933, was forecasted at 4,000,000 bales. Estimated production for 1931-32 in other political divisions of the world, besides the major cotton countries, was for Spain 4000; Algeria, 1349; Eritrea, 1706; Italian Somaliland, 5435; Syria and Lebanon, 17,000; Turkey, 91,000; Greece, 14,000; and Bulgaria, 5000.

Egypt produced in 1932-33 a crop estimated at 1,028,000 bales, compared with 1,317,000 in 1931-32. The 1933-34 crop was estimated at 1,819,000 bales from 1,873,000 acres, an area 65 per cent larger than in 1932-33. The high indicated acre yield, 464 pounds, appeared due to good production conditions, a higher proportion of productive varieties, and crop rotation. Only 21.7 per cent of the total acreage was planted to Sakellarides. The revision in the acreage-restriction law, low returns from other crops, and advance in cotton prices seemed to explain the large increase in the 1933 acreage.

The U.S.S.R. (Russia), according to estimates at the end of 1933, produced 1,890,000 bales in 1933 as compared with 1,790,000 in 1932. The area was indicated to be at most 4,800,000 acres compared with 5,139,000 in 1932, a decrease of 339,000 acres. The 1933 procuring plan was set at 1,346,200 tons of unginned cotton, i.e. from 1,925,000 to 2,050,000 bales of 478 pounds of ginned cotton. Total procurings for the Union as a whole were reported to have equaled 84.1 per cent of the cotton plan on Nov. 20, 1933, compared with 68.5 per cent on Nov. 25, 1932.

In China, the crop was expected to approximate 2,500,000 bales, about 10.6 per cent more than the 2,260,000 bales of 1932, and compared with a 3-year average production of about 2,096,000 bales. The crop in 1933 was grown on an estimated area of 6,000,000 acres compared with 5,630,000 in 1932.

The Bureau of Agricultural Economics, United States Department of Agriculture, also issued multigraphed publications on a graphic summary of American cotton production, consumption and prices; the stability of color in raw cotton; jute versus cotton baggings for American cotton bales; American cotton-tare practices and problems; uses for cotton; and recent developments in the domestic cotton textile industry.

COTTON, HENRY ANDREWS. An American psychiatrist, died in Trenton, N. J., May 8, 1933. Born in Norfolk, Va., May 19, 1869, he was graduated from the Baltimore Polytechnic Institute in 1894 and took his medical degree at the University of Maryland in 1899. After serving his internship at the City Asylum in Baltimore and acting as assistant physician at the State Hospitals for the Insane in Worcester and Danvers, Mass., he studied during 1905-06 at the Royal Psychiatric Clinic in Munich, Germany. There under Prof. Alois Alzheimer he became especially interested in the relation of physical factors to the causation of mental disorders and, on his appointment as medical director of the New Jersey State Insane Asylum in Trenton in 1907, proceeded to apply this theory to the rehabilitation of the mentally sick. He became widely known for the relief of certain forms of insanity which he achieved through the elimination of infected foci, such as teeth, tonsils, and nasal sinuses, and the removal of diseased parts of the stomach, intestines, and genito-urinary tract.

Dr. Cotton also attributed the cause of delinquency in many instances to a diseased physical condition, when serving as director of the Psychiatric Clinic for Correctional Institutions of New Jersey, and in 1921 delivered at Princeton the Vanuxem lectures, which were subsequently published as *The Defective, Delinquent, and Insane*. He retired as director-emeritus of the New Jersey State Asylum in 1930.

COURT GAMES. RACQUETS. The story of racquets in 1933 was again the tale of the prowess of Clarence C. Pell, veteran from Tuxedo, N. Y. For the fourteenth time since 1915 this angular expert won the national championship, proving himself as nearly invincible as ever and drawing attention to the fact that he is the greatest master in the history of the amateur ranks. Pell, 48 years old in the summer, breezed through a fine field in February to win the title on the magnificent courts of the Racquet and Tennis Club in New York. He eliminated Herbert N.

Rawlins, Jr., 1932 finalist, in straight games in the semi-final and conquered Huntingdon D. Sheldon of New York in a four-game final, thus successfully defending the crown.

A few weeks previous Pell had, for the thirteenth time, won the famed Tuxedo Gold Cup tournament with his blasting service, downing E. M. Edwardes of Philadelphia in decisive straight games in the final.

Stanley W. Pearson and William C. Wright of Philadelphia, defending champions, worked their way to the doubles final, but there were beaten in a hard fought five-game match by Rawlins, former three-time national squash racquets champion, and W. Palmer Dixon.

COURT TENNIS. James H. Van Alen, who had played lawn tennis for several years, was the surprise of the court tennis campaign of 1933, winning the national championship in this most intricate of all games by beating the 1931 and 1932 titleholder, William C. Wright of Philadelphia in the final. The sudden rise of the Newport player came as a surprise but after his defeat of Wright, the experts were willing to admit that young Van Alen was a worthy successor to the crown. A few weeks before the national, Van Alen had fallen before Ogden Phipps in the final of the Tuxedo Gold Cup. Wright paired with George B. Fearing of Boston to take the national doubles honors. Pierre Etchebaster, Basque who holds all the professional laurels in the game, was not called upon to defend his honors, no professional tournaments being played, but in exhibitions he conquered all the leading professionals in the United States and abroad.

SQUASH RACQUETS. Beekman Pool, youthful representative of the Harvard Club of New York successfully defended his national squash racquets' crown at Detroit in February and at the end of the year seemed to stand alone in a field becoming more and more crowded each day. Pool had succeeded his brother, J. Lawrence Pool, as champion in 1932 and in 1933 outdistanced his brother and all other experts. The game became increasingly popular, with men taking it up first as an exercise and then in earnest in tournaments in all classes.

Beekman Pool defeated Neil J. Sullivan, of Philadelphia, in the final round at Detroit and also won the Metropolitan singles honors when he downed young William C. Coyle, Jr., of the Montclair Athletic Club in the final. Sullivan paired with Roy R. Coffin to take the first national amateur doubles tournament held, defeating Lathrop S. Haskins and R. A. Goodwin of New York in the final. The Metropolitan doubles went to George D. Debevoise and Perry R. Pease of the Racquet and Tennis Club, and Edwin H. Bigelow of Heights Casino, won the Metropolitan veteran's singles tourney, beating J. C. Rochester in the final.

Agne Martin of Hamilton, Ont., succeeded Sir John Child as Canadian champion, but Child won the doubles with George D. Hudson. William Foulke of Princeton won the intercollegiate title and John Skillman of Princeton was crowned national professional titleholder. The National team championship went to Philadelphia as did the Lockett Trophy. The Lockett Trophy invitation doubles fell to Donald Strachan and B. D. Walsh of Philadelphia, and the Lapham Trophy was retrieved after a lapse of a year by Canada.

An invasion of the United States by a team of women from England resulted disastrously for

the visitors. The visitors took the team matches and then Miss Susan Noel of England walked through easily to the national championship. The national doubles went to Mrs. C. C. Madeira and Miss Anne Page of Philadelphia, but England added the New York State singles to the bag when Miss Cecily Fenwick, national finalist, won. Mrs. H. Stuart Green of Sleepy Hollow captured the Metropolitan singles.

SQUASH TENNIS. Harry F. Wolf, former Williams College lawn tennis player, was again superb in squash tennis in 1933, winning the national amateur championship for the fourth successive year, topping Rowland B. Haines of the Columbia Club of New York in the final. The New York Athletic Club player appeared to have even greater speed and force in his shots in 1933 and was unbeaten through the entire season of tournaments and team play. Frank Ward of the City Athletic Club was also invincible and continued his reign as open champion by downing Thomas Iannicelli of the Essex Club in the final round.

Fillmore Van. S. Hyde, former four-time amateur champion, succeeded Frank A. Sieverman, Jr., of the New York A.C. as veteran's champion. Sefton Tranter of the New York A.C. won national class B honors and class C laurels went to Edward Kemble of the Bayside Tennis Club.

Squash tennis's popularity again waned before the onslaught of squash racquets. The former game seemed too hardy for most of the players, who preferred the finesse of the latter game to the terrific speed of squash tennis.

CRAIG, SIR JAMES. An Irish physician, died in Dublin July 12, 1933. He was born at Castlecatt, Bushmills, Co. Antrim, Oct. 16, 1861. On his graduation from Dublin University in 1885, he was attached to the Meath Hospital, Dublin, first as assistant physician (1886-92) and then as visiting physician (1892-1910). He served also from 1886 to 1896 as assistant physician to the National Children's Hospital and was consulting physician to Sir Patrick Dun's Hospital, the Crookslane Sanatorium for Consumption, and the Cottage Hospital, Drogheda. At the Institute of the Royal College of Surgeons he was demonstrator of anatomy; at Carmichael College, Dublin, extra lecturer on medicine; and in the school of physio of Trinity College, Dublin, King's professor of medicine. He acted as external examiner in medicine to Queen's University, Dublin, from 1916 to 1920. From 1897 to 1910 he was registrar for the Royal College of Physicians in Ireland and from 1904 to 1910 general secretary and editor of the *Transactions* of the Royal Academy of Medicine in Ireland.

Sir James was active in the British Medical Association, being a member of the Central Council and vice-president of the medical and neurological sections. He was also a Fellow and past president of the Royal College of Physicians in Ireland, a member from 1913 to 1916 of the council of Trinity College, Dublin, and a frequent contributor to the *Dublin Journal of Medical Science* and the *British Medical Journal*. As representative for Dublin University in the Dail Eireann after 1921, he introduced a bill legalizing the Irish Sweepstakes, from which the Irish hospitals benefit. He was knighted in 1921.

CREDIT. See BANKS and BANKING.

CREDIT-ANSTALT. See AUSTRIA under History.

CRETE, krēt. An island administrative division of the Greek Republic lying about 150 miles southeast of the mainland. Area, 3195 square miles; population (1928 census), 386,427. Khania (Canea), the capital, had 26,604 inhabitants in 1928; Irakleion (Candia), the largest city, 33,404. The chief products are currants, grapes, wine, olives, citrus fruits, some cereals, and garden products. The island is an intermediate station on the London-India air-mail line. See GREECE.

CRICKET. For the first time, cricket attracted great interest in the United States in 1933. When Australia and England met at Sydney for the Ashes, emblematic of the international cricket championship, the recriminations and verbal attacks echoed over the world. In a hard fought test series, England regained the Ashes. Larwood, the English bowler, was accused by the Australians of body-line bowling or bowling at the batters' heads (throwing a bean ball in baseball jargon), and this brought on heated arguments and even recourse to Marylebone, the ruling cricket body. In the end the English left with the honors and Larwood was the hero of England, being offered tremendous sums for his story for newspapers and magazines.

The cricket season in the United States was greatly enlivened by the visit of Sir Julien Cahn's picked team, including four British internationals. In their tour through Canada, the United States, and Bermuda, the visitors won sixteen and drew four games. The Brooklyn Cricket Club and the Crescent Athletic Club tied for laurels at the end of the regularly scheduled Metropolitan and New Jersey Cricket Association season, and in the playoff, post-season to decide the championship, Brooklyn won.

CRIM, JOHN WILLIAM HENRY. An American lawyer, died at Somerville, N. J., July 3, 1933. Born in Loudoun Co., Va., Mar. 31, 1879, he attended William and Mary College and in 1906 was graduated from the New York Law School. On his admittance to the bar in 1907 he served successively as special assistant, assistant United States attorney, and special assistant United States attorney general in New York in the conduct of cases brought against railroads and other corporations under the anti-trust act and the act to regulate commerce. He engaged in private practice after 1913 but in 1921 was again chosen special assistant United States attorney in the investigation of income tax frauds, collecting thereby for the government more than \$1,000,000.

As assistant United States attorney general during 1921-23, Mr. Crim had general supervision of the prosecution of criminal cases, with the exception of those pertaining to prohibition. He conducted investigations with regard to fraud in the offices of the Alien Property Custodian, Internal Revenue, and United States Penitentiaries, securing the indictment of Thomas P. Miller, Alien Property Custodian. He directed also a staff engaged in the prosecution of several hundred mail-fraud defendants, including Dr. Frederick A. Cook who in 1909 had claimed discovery of the North Pole, and personally conducted the investigations leading to the conviction of Congressman John W. Langley, Gaston B. Means, and others.

Mr. Crim next prosecuted Charles R. Forbes, director of the United States Veterans' Bureau, on the charge of inefficiency and wasteful extravagance, the jury finding him guilty in June,

1925, of conspiracy to loot the funds of the bureau. After acting as special assistant in the investigation leading to the resignation of George W. English, United States District Judge, in 1926, he resumed his practice in New York City.

CRIME. It became apparent during the year that the Federal government itself was going to make every effort within its power to cope with a crime situation which obviously had got beyond the control of local authorities. Particularly pressing were the questions raised by the termination of the prohibition experiment and the appearance of large groups of unemployed persons. During the prohibition era it was plain that the various activities associated with the manufacture, transportation, and sale of illicit liquor were engaging a sizable army of persons, some of whom were actual criminals and some of whom had entered the business because other opportunities were closed to them. To put it realistically, these people were being thrown once more on the criminal labor market and of necessity were being compelled to cast about for new occupations into which to direct their energies. One of the most sinister of such criminal activities that racketeers, gangsters, and bootleggers were resorting to was kidnaping or, as it was known in the parlance of the underworld, the "snatch racket." Criminals, who had always engaged in, from the social point of view, the particularly heinous crime of kidnaping, had always conducted their nefarious trade, but more or less covertly. The reason was that up to quite recently their victims were invariably persons who, like the kidnapers themselves, belonged to the criminal element, that is to say, they were gamblers, bootleggers, counterfeiters, and the like. These persons, when seized and held for ransom, usually met the demands of their captors without making any effort to enlist the services of the police authorities, seeking to pay off the scores in their own way. However, when criminals began to kidnap—as was happening increasingly during the years 1932 and 1933—respectable members of the community and hold them for ransom, then this type of illegal activity began to take on particularly reprehensible forms. The demand of public opinion was responsible for the passage by Congress in 1933 of an act making kidnaping a Federal offense and punishable by long terms of imprisonment. The result was that the Federal agencies, who were unhampered by the local political ties which bound municipal police authorities, began to move with an expedition and dispatch that threw terror into the hearts of the persons engaged in the "snatch racket." So successful were federal operators in tracking down desperate gangs and summarily bringing their members to the bars of justice, that Americans began to breathe easier. It came to be felt that the entrance of the Federal authorities on the scene was a device that had long been necessary and now that it was finally being used, was going to have an important success in coping with the crime problem.

The American Bar Association was also becoming increasingly active. A committee of the organization in December launched an inquiry, utilizing State and county lawyer associations throughout the country, for the purpose of conducting coordinated local investigations of criminal law and its administration. It was declared that it was to be the function of this committee to study the administration of local police departments, district attorneys' offices, and the local

courts, and to see to it that these agencies were strengthened in method and organization and vigorously and effectively employed for the protection of society. The inquiry was to cover the following nine problems: 1. Relation between politics and crime. 2. Efficiency of prosecuting officials and agencies. 3. Police activity in prevention of crime and detection and arrest of criminals. 4. Operations of unethical criminal lawyers and the extent to which unethical practice interferes with enforcement. 5. Interference of the racketeer in legitimate business. 6. Prevalence of kidnaping and kidnaping threats and the punishment of kidnapers. 7. Codes of criminal procedure and their conformity with the model code of the American Law Institute. 8. The relative efficiency of the local and Federal courts in disposing of criminal cases. 9. The awakening of local bar associations to their responsibility for improving the administration of criminal justice. According to the plans made, answers from the local associations to these nine problems raised were to be sent out not later than Jan. 15, 1934.

The *American Observer*, in its issue of Dec. 20, 1933, in a comprehensive and fair review of the crime situation in the United States, admitted that the crime record of the country was "one of the things of which we can least be proud." It also indicated its belief that the nation's crime bill amounted to more than \$13,000,000,000 annually. However, it called attention to the fact that it was impossible to get an accurate and reliable picture of the extent of crime in the United States, in the first place, because statistics were highly inadequate and, in the second, because there was no common basis for reporting from the various local jurisdictions. It also pointed out that it was impossible to tell whether or not the country was going through periodic crime waves, largely because newspapers were in the habit of giving particular attention to sensational deeds of violence when they did occur. On this point it cited the statement of President Hoover's Committee on Social Trends which said:

No support is found for the belief that an immense crime wave has engulfed the United States. The number of arrests and of court cases per 100,000 population increased moderately from 1900 to 1930, with a tendency to rise more rapidly after 1920 than before. A large part, however, of the increase in the last decade is explained by traffic cases, which increased at approximately the same rate as automobile registrations. Arrests and prosecutions for major crimes increased even less rapidly than the rates for minor crimes and in many of the series reached a level about 1925. Prosecutions in federal courts were fairly constant from 1900 to 1917, after which an enormous increase occurred, but this was due principally to the large number of liquor cases. Federal cases, also, reached a level about 1923 and have not changed significantly since that date. The record of crimes known to the police, which is potentially the best index of the number of serious crimes, shows a slightly lower rate in 1931 than in 1930. These figures do not indicate that crime has swept over the country like a tidal wave. Rather the movement of these indexes resembles the gradual rise of the level of a body of water. The rate of increase is more rapid than in such geological processes but the general effect is analogous. This gradual and continuous rise is what would be expected on theoretical grounds, if the number of social factors cited in the introduction of this chapter were functioning together over a period of time.

In seeking to analyze the causes for the continuance of crime in the country, the *American Observer* pointed out that they were three-fold and of a social, political, and racial nature. One of the primary causes of crime in the United States was to be found at the very heart of the national life. Due to the fact that the United States had always had a "changing society" in

which the frontier influence with its characteristic habits of freedom and individual action played such large rôles Americans had grown accustomed to feeling themselves independent of authority and law; therefore respect for legal restraints was difficult to assume and lightly brushed aside. In the second place the existence of classes in the country, the widespread nature of poverty and on the other hand the great extremes of wealth, slum dwelling, inadequate recreational opportunities, small opportunities for the educating of the young in skilled activities also played their part. Heywood Brown, writing in the *New York World-Telegram*, stressed particularly the factor of poverty in the crime situation. He said:

The one great cause of crime is poverty. Look into the case history of all criminals and in a large majority of the cases you will find that you are dealing with a human being who was undernourished, undereducated, warped, and ruined by his inability to cope with a fiercely competitive world for which he was wholly unfitted. . . .

I can take anybody to certain blocks in large American cities and point to crowded sidewalks and dark doorways swarming with boys and girls just learning to walk. And I can say with complete truthfulness:—"Here is your kindergarten for San Quentin. Meet some members of the freshman class of 1930 at Sing Sing. Here is abject, grinding poverty, and here, as sure as poppies grow in Flanders, are the seeds of crime."

In the next place, another reason for the high crime record in the United States was the matter of race. Crimes of violence were particularly common among the Negro groups, largely due to the fact that the Negroes were more emotional than other elements in the population. Finally, it was generally admitted that the administration of justice in the country was extremely faulty and responsible for a great deal of crime. The Committee on Recent Social Trends made the following remarks on the subject of the enforcement of the law by the legal machinery:

The people of the United States are politically decentralized, both in form and in spirit, and are still moved by the ideas of the rural society of the nineteenth century. In most States, judges, prosecutors, and clerks are elected. Each court, each police department, each jail, is an independent entity. The spoils system is a part of the political creed and practice. More fundamental still are the fears of executive despotism, expressed in the Jeffersonian saying, "the least government is the best government." The American people are only gradually accepting the principle of the administration of government by experts and as long as the citizen does not consciously lose money as a result of the inefficiency of officeholders he is characteristically content. Hence, only the rudiments of that professional pride within the civil service which one finds in Great Britain or Prussia are found here. Moreover, many Americans think of government in terms of what they, as persons, not as citizens, can get out of it—the "fixing" of parking tickets, a contract "thrown," a tariff rate raised. On those rare occasions when they become discontented they change personnel, principles of administration, and laws in a desperate effort to secure improvement. Inefficiency of administration is one of the many causes of crime and in turn a large volume of crime adds to administrative confusion and inefficiency.

HOMICIDE RECORD. In 1932, according to the careful investigation made by Dr. Frederick L. Hoffman, whose surveys on the subject have been previously commented upon in these columns, the United States led the civilized nations of the world in the number of homicides. According to Dr. Hoffman the homicide rate, as a result of police reports obtained from 180 cities, was 10.8 per 100,000 population, which was the same rate for 1931. Homicidal deaths for the five years beginning in 1927 and ending with 1931 totaled 51,206. Dr. Hoffman, in commenting on the alarming character of these figures, declared: "Murder more than ever is becoming an ingenious art, if

not a trade, in this country." The homicide rate for 1931 in England and Wales was 0.5 per 100,000 population. The accompanying table shows the number of homicides in the more important American cities in 1931 and 1932.

Cities	1931		1932	
	Deaths	Death rate per 100,000	Deaths	Death rate per 100,000
Atlanta, Ga.	144	49.5	122	39.7
Augusta, Ga.	16	26.1	23	37.1
Baltimore, Md.	88	10.8	82	10.0

Washington, D. C.	77	15.6	110	22.1
Youngstown, Ohio	23	13.2	20	11.2

SUICIDES. Again according to Dr. Hoffman, the world suicide record for 1932 plainly reflected the effects of the depression, many countries recording new high marks. In the United States in 1932, approximately 23,000 persons took their own lives as against 20,088 in 1931. The rate for 100 American cities rose from 20.5 per 100,000 in 1931 to 21.3 in 1932, the highest figure ever reached with the exception of 1908, when the rate was 21.5. As a result of an intensive study of the marital status of suicides in New York City for the period 1921-31, Dr. Hoffman came to the conclusion that the rate for divorced persons was considerably higher than for the married, widowed, or single. Over the period in question the rate for New York City per 100,000 was 24.3. For married persons it was 24.6; for the widowed it was 44.3; for single persons it was 18.9; and for divorced persons it was 81.2. Another interesting conclusion reached by Dr. Hoffman was that just as there was a concentration of homicide deaths in the south there was a definite concentration of suicide deaths on the Pacific coast. The following were the rates of the 10 American cities with the highest records in 1932: Davenport, Iowa, 50.3; Sacramento, Calif., 43.1; Seattle, Wash., 42.0; Cedar Rapids, Iowa, 41.5; San Francisco, Calif., 39.9; San Diego, Calif., 38.4; Omaha, Neb., 36.5; Denver, Colo., 36.3;

Portland, Ore., 35.4; Tacoma, Wash., 32.1. At the other end of the picture was Troy, New York, which had a suicide rate of 1.3 per 100,000 population. The rates of the five largest cities in the United States for 1932 were as follows: Chicago, Ill., with 597 suicide deaths, 16.9; Detroit, Mich., with 311 suicide deaths, 18.4; Los Angeles, Calif., with 398 suicide deaths, 28.8; New York, N. Y., with 1595 suicide deaths, 22.1; Philadelphia, Pa., with 353 suicide deaths, 17.8. All these cities, with the exception of Chicago, showed increases in the death rate over that of 1931. In many cities the jump in the suicide rate was extraordinary. In Montgomery, Ala., the rate increased from 8.9 in 1931 to 24.7 in 1932; in Lansing, Mich., from 16.1 to 30.1; in Lancaster, Pa., from 19.7 to 29.3. According to Dr. Hoffman the position of the United States among the nations of the world as regards suicide deaths was about average, the range in suicidal frequency ranging from 3.3 per 100,000 population in the Irish Free State to 34.5 in Austria.

NEW YORK CITY. The annual report of the police department of New York City for 1932 showed a total number of arrests made of 516,128, of which 449 were for murder and manslaughter. The total number of homicides reported for the year was 478. During the year also convictions for murder and manslaughter totaled 98 and in 21 cases, murderers were sentenced to death. Homicides, by investigators in 38 cases, were attributed to disputes and feuds among gangsters; killings with "marital troubles or passion" as their motives totaled 112. Of the total of 516,128 arrests made in the city for all manners of offenses, upward of 350,000 were connected with motor vehicles in one way or another. Of traffic summonses and arrests there were 322,578 which resulted in 296,963 convictions. Principally the increase in traffic violation arrests was attributable to better vigilance on the part of the police in view of the fact that the number of registered cars in operation in the city had declined over the year. This was best demonstrated in the case of taxicabs, 27,082 taxicab licenses having been issued in 1931 against 18,367 in 1932. Arrests for stealing automobiles in 1932 totaled 2448 compared with 1618 in 1931. Accidents in the streets showed a considerable decline. Motor vehicle fatalities totaled 1032 of whom 262 were children. This was the lowest number of fatalities suffered by children in the streets in the last 11 years. Accidents involving motor and other vehicles injured 12,706 children and 37,284 adults during the year—a total of 49,998 as compared with 53,886 injured in 1931. Assault and robbery cases were slightly fewer than in 1931 and burglary cases were almost 10 per cent less. Grand larceny cases, of which the greater number involved the theft of automobiles, dropped more than 25 per cent when 1932 was compared with 1931. Fifty-one per cent of those arrested for stealing automobiles were youths between 16 and 20 years. Forty per cent of the arrests for burglaries were boys under 21. In violent crimes, however, arrests between the ages of 16 and 20 years were lower than in 1931. According to the Commissioner of the Police Department, the peak of crime ages, as indicated by arrests, seems to lie between 26 and 30 years. A total of 6264 juvenile delinquents, that is, children under 16, were arrested, more than 1 out of 3, being picked up for "general criminality." Five hundred of these children were charged with in-

corrigibility, 400 were destitute, 764 were accused of burglary, and 1549 with minor thefts. Only 55 were charged with offenses against chastity and 116 with offenses against the person. In commenting on this situation the Commissioner declared

In the last four years 26,836 children under 16 years of age have been arrested in New York City for juvenile delinquency. Each of these presented an opportunity to deal with a potential criminal. While the problem is a complex one and the attack on it must be from many angles, it is obvious that one of the most direct and specific lines of attack is through the prevention of juvenile delinquency. The Crime Prevention Bureau is developing a sound programme toward this end. It is no longer a question of theory, for the department is already well launched upon a practical demonstration of what the police can do to prevent juvenile delinquency.

The following table is a tabulation of arrests by type of offense and age groups in 1932. The cost of policing a great city like New York may be ascertained from the fact that New York City's police department in 1932 spent \$65,253,948.

TOTAL NUMBER OF ARRESTS BY AGES, BY GROUP, FOR THE ENTIRE YEAR OF 1932

<i>Criminal group</i>	<i>16-20 years</i>	<i>21-25 years</i>	<i>26-30 years</i>	<i>31-35 years</i>	<i>36-40 years</i>	<i>41-50 years</i>	<i>51-60 years</i>	<i>Over 60 years</i>	<i>Total arrests</i>

Total	39,186	101,328	117,162	96,654	70,618	64,245	17,486	3,181	516,128

The report also lists 6268 arrests of children under 16 years of age for juvenile delinquencies, that number being included in the above general total of 516,128 persons of all ages.

CRITICISM. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE, ETC.

CROATIA (krô-â'shî-â) **AND SLAVONIA.** A former crownland of the Austro-Hungarian Empire now incorporated in Yugoslavia.

CROATS. See YUGOSLAVIA under *History*.

CROP REPORTING BOARD. See COTTON.

CROPS. See AGRICULTURE, and articles on various crops such as CORN, TOBACCO, WHEAT, ETC., also paragraphs on *Agriculture* under various States and on *Production* under countries.

CROSS-COUNTRY RUNNING. Runners from the mid-West captured the two important cross-country titles of the 1933 season, the national senior A.A.U. crown and the individual intercollegiate championship. Ray Sears of Butler University annexed the former title and the intercollegiate, run at Van Cortlandt Park, in New York City in November, fell to Tom Ottey of Michigan State. A year ago the Eastern section of the country held a virtual monopoly on the titles, team, and individual, but all this was changed in 1933.

Besides watching the national and the inter-

collegiate go West, Manhattan College's strongly favored team lost out in the intercollegiates to a well-balanced Michigan State squad. The national senior team title did remain in the hands of the Millrose A.A. runners, who also repeated in the Metropolitan junior and senior fixtures.

Joe Mundy of Philadelphia won the national A.A.U. junior test and team honors in that meet went to the Meadowbrook Club of Philadelphia. Louis Gregory of the Millrose A.A., and a member of the United States 1932 Olympic squad took the Metropolitan senior event and Tom Russell of Manhattan College ran off with the Metropolitan intercollegiates, captured by the Manhattan College team with a perfect score of fifteen points as well as sixth place to boot.

By far the most sensational runner of the season was young Steven Szumachowski, of the Mont Pleasant High School of Schenectady, N. Y., who increased his string of victories over two seasons to seventeen straight when he retained his national scholastic title at Newark, N. J., Thanksgiving Day. Szumachowski had

easily beaten all scholastic opposition in the East and had, on several occasions bettered college times for the course. Nott Terrace High School of Schenectady gained the team title in the scholastic championships.

CRUPPI, kru'pé', JEAN. A French statesman, died at Fontainebleau, Oct. 17, 1933. He was born at Toulouse, May 22, 1855, and received his education there. After acting as substitute attorney in the Tribunal of the Seine, he became general advocate in the Court of Paris and from 1893 to 1898 was advocate in the Court of Cassation. Entering Parliament in 1898 as deputy for Haute-Garonne, he served as vice-president of the Chamber and in 1907 became president of its radical Left wing. His ministerial career included the portfolios of commerce in Clémenceau's cabinet of 1908-09, of foreign affairs in Monis's cabinet of 1911, and of justice in Caillaux's cabinet of 1911-12. Previous to his death he was advocate in the Court of Appeals of Paris, president of the General Council, and Senator.

Cruppi was made a chevalier of the Legion of Honor. His publications included: *Un avocat journaliste au XVIII^e siècle—Linguet*, which was

crowned by the Academy in 1895; *Pour l'expansion économique de la France* (1910); and *Femmes écrivains d'aujourd'hui* (1912).

CUBA. A large island in the West Indies under Spanish sovereignty until Dec. 10, 1898, and established as a republic on Feb. 21, 1901. Capital, Havana (Habana).

AREA AND POPULATION. Cuba has an area of 44,164 square miles, including the Isle of Pines (1180 square miles) and other small islands (1350 square miles). The population at the 1931 census was 3,962,344, as against 2,889,004 at the census of 1919. The 1931 population, amounting to 90 persons per square mile, was divided among the six provinces as follows (1919 figures in parentheses): Pinar del Rio, 343,480 (261,198); Habana, 985,500 (697,583); Matanzas, 337,119 (312,704); Santa Clara, 815,412 (657,697); Camagüey, 408,076 (228,913); Oriente, 1,072,757 (730,909). The population of the chief cities in 1931 was: Havana, 542,552; Santiago de Cuba, 103,525. In 1930, estimates for the other cities were: Camagüey, 48,773; Matanzas, 46,717; Cienfuegos, 39,946; Marianao, 32,285; and Cardenas, 29,304. More than 70 per cent of the population belong to the white race, the remainder being chiefly Negroes and mulattoes. In 1932, about one-tenth of the inhabitants were aliens.

EDUCATION. Elementary education is free and compulsory. For the year ended June 30, 1932, there were 3816 public schools, with 434,279 pupils, and 364 private schools, with 26,622 pupils. There was a special Institute in each province for advanced education, in addition to the University of Havana. The university had 4795 students before it was closed as a result of political agitation in 1931. It was reopened in 1933, following the overthrow of the Machado régime. See *History*.

PRODUCTION. Sugar is the major factor in the island's economy, comprising about 70 per cent of the total exports. During the period 1928 to 1933, the sugar industry was in acute distress, due to overproduction, price declines, the raising of the American tariff on Cuban sugar, and the closing of other markets. Cuban sugar production declined from 5,156,000 long tons in 1928-29 to 1,994,528 long tons in 1932-33. The average price per pound (Cuban raw, c and f New York excluding duty) fell from 5.24 cents in 1923 to 0.925 cents in 1932 and the total value of the Cuban crop slumped from an annual average of \$308,424,000 for the years 1921-26 to \$76,197,000 for the 1930-31 season and to about \$41,981,000 in 1931-32. The stagnation of the sugar industry spread economic suffering and political unrest throughout Cuba and contributed to the political developments of 1933. Presidential decree of Dec. 29, 1933, fixed the maximum 1934 sugar crop at 2,315,459 long tons.

Other leading crops are tobacco (34,693,000 pounds in 1932), coffee, cacao, cereals, fruits, and potatoes. The forests supply cabinet and dye-woods, fibres, gums and resins. The island's large iron-ore and manganese deposits are worked by American interests. Copper, gold, and salt are other minerals produced. Livestock in 1930 included 4,338,819 cattle, 629,112 horses, 89,389 mules, 101,727 sheep, and 590,912 swine. After 1925, there was a growth of secondary manufacturing industries behind a protective tariff, chiefly in the canning, clothing, footwear, furniture, textile, paint, paper, glass, and cement in-

dustries. The output of smelter copper in 1932 was 20,743 metric tons (13,291 in 1931); iron ore (exports), 62,476 tons (116,126 in 1931).

COMMERCE. Cuban exports and imports declined from an aggregate of \$488,655,000 in 1929 to \$131,686,000 in 1932, as is shown in the accompanying table.

IMPORTS AND EXPORTS OF CUBA
[In thousands of dollars]

Year	General imports	Exports of Cuban products	Favorable trade balance
1929	\$216,215	\$272,440	\$56,225
1930	162,452	167,411	4,959
1931	80,112	118,866	38,754
1932	51,024	80,672	29,648

Trade between the United States and Cuba showed a similar decline. Cuban exports to the United States, mostly sugar, declined from a yearly average of \$235,864,000 during the years 1925 to 1929 to \$58,330,270 in 1932 and \$58,436,789 in 1933. Cuba's imports from the United States averaged \$150,078,000 during 1925-29, but fell to \$28,754,509 in 1932 and \$25,092,862 in 1933.

The leading 1932 imports (1931 figures in parentheses) were: Cotton manufacture, \$6,177,000 (\$8,094,000); rice, \$5,354,000 (\$7,538,000); wheat flour, \$3,085,000 (\$3,843,000); iron and steel, \$2,451,000 (\$3,533,000); crude mineral oils, \$2,084,000 (\$2,304,000). Exports in 1932 and 1931 were: Raw sugar, \$39,682,000 (\$64,918,000); refined sugar, \$14,290,000 (\$13,655,000); unmanufactured tobacco, \$4,605,000 (\$16,635,000); molasses, \$3,457,000 (\$4,860,000); cigars, \$2,365,000 (\$6,036,000); fresh fruit, \$2,835,000 (\$2,991,000). The United States in 1932 supplied 54.2 per cent of Cuba's total imports (57.4 in 1931); United Kingdom, 5.9 (5.0); Spain, 5.8 (5.2); France, 3.3 (3.6). Of Cuba's exports, the United States took 71.3 per cent in 1932 (74.9 per cent in 1931); United Kingdom, 15.4 (13.9); France, 2.5 (1.7); Spain, 1.8 (1.5).

FINANCE. Cuban government finances were in a chaotic condition at the end of 1933, due to revolutionary disturbances and the failure of the Machado government to publish actual budgetary results after the fiscal year 1928-29. Estimated actual revenues, including loans and other special funds, declined from \$124,017,000 in 1928-29 to \$83,475,000 in 1930-31. Regular budgetary revenues were \$89,908,000 in 1928-29 and \$59,581,000 in 1930-31. Total expenditures declined from \$131,463,000 in 1928-29 (of which \$86,765,000 were regular budgetary expenses) to \$97,748,000 in 1930-31 (\$67,887,000 regular). Expenditure estimates in the regular budget for the fiscal year ended June 30, 1932, were \$60,381,494 and actual returns were: Receipts, \$68,741,000; expenditures, \$84,279,000. For 1932-33, estimated expenditures were \$51,475,214 and another actual deficit was indicated. For the fiscal year 1933-34, the probable income was estimated at not more than \$43,000,000, of which \$11,550,000 was earmarked for service on the external debt and \$8,000,000 for the army, leaving \$25,000,000 for all other expenses. Actual figures for 1932-33 or 1933-34 were not available, however.

According to a statement issued by the Cuban Consulate General in New York, Nov. 21, 1933, the funded public debt on Sept. 30, 1933, totaled \$162,706,000, compared with \$182,463,000 on June 30, 1932. The 1933 total was made up as

follows: External debt, \$53,272,000; public works debt, \$80,879,000; internal debt, \$7,816,000; and the sugar stabilization loan of 1930, \$20,738,000. In addition there was a floating debt of between \$42,000,000 and \$50,000,000.

FOREIGN INVESTMENTS. The U. S. Department of Commerce in 1933 estimated the long-term investments by Americans in Cuba at \$1,040,000,000, a sum which placed the island second to Canada as a foreign field for American financial enterprise. The investments were distributed as follows: Cuban government bonds, \$103,000,000; Cuban non-government bonds, \$3,000,000; sugar plantations and centrals, \$544,000,000; fruit and agriculture, \$35,000,000; petroleum distribution, \$10,000,000; manufacturing enterprises, \$45,000,000; railroads, including sugar lines, \$120,000,000; public utilities, \$100,000,000; miscellaneous, \$80,000,000. British investments in Cuba were estimated at about £36,556,000, including about £29,269,000 in railways.

COMMUNICATIONS. Railways operating as public carriers had 3040 miles of line in 1930-31. All lines were privately owned, most of them by British capital. In addition there were some 3000 miles of line belonging to sugar companies. In 1930-31, the public lines carried 11,890,000 passengers and 18,256,000 long tons of freight. The opening on Feb. 24, 1931, of the Central Highway, traversing the island for 706 miles from Santiago to Pinar del Rio, paralleled the lines of the two largest railway systems and greatly reduced their earnings. Total earnings of the four principal railways dropped from \$32,447,451 in the year 1929-30 to \$14,258,660 in 1931-32. Government highways in 1930 aggregated 1990 miles. Air mail and passenger lines connect Cuba with North and South America, Mexico, and neighboring Caribbean islands. In 1930, 5543 vessels, of 13,605,000 net registered tons, entered Cuban ports and 5509 vessels, of 13,481,000 tons, cleared.

GOVERNMENT. The Constitution, as amended May 11, 1928, vested executive power in a president, elected for six years and ineligible for reelection. Legislative power rested in a national congress of two houses, the Senate of 37 members elected for six years (nine years after 1933) and the Chamber of Representatives of 128 members, elected for six years by male and female suffrage. President at the beginning of 1933, Gen. Gerardo Machado y Morales (Liberal), who was inaugurated May 20, 1929, for a second term expiring May 20, 1935. During the latter part of Machado's administration, all three parties represented in Congress—the Liberal, Conservative, and Popular parties—were under his control. The country was divided into six provinces and 119 municipalities. Each province was administered by a governor, elected indirectly, and a council; each municipality by an *alcalde* (mayor) and an elected municipal council. Havana was made a Federal District in 1931, with an *alcalde* and council appointed by the President. For developments during 1933, see *History*.

HISTORY

THE STRUGGLE AGAINST MACHADO. The opening of the year 1933 found the Cuban people suffering from acute economic privations and seething with political unrest under the ruthless dictatorship of President Machado. Supported by the great majority of the population, students and other Opposition groups were engaged in a savage

underground warfare of terrorism and assassination against the government. The island was under martial law, constitutional guarantees were suspended, the press was rigidly censored, all criticism of the government was forbidden. Exercising absolute control over the army, the police, the National Congress, and ignoring the adverse decisions of the Supreme Court, the President caused his opponents to be assassinated, exiled, or imprisoned without trial. Since the crushing of the anti-Machado revolt of August, 1931, the Opposition had resorted increasingly to terrorism and sabotage, while Machado tightened his repressive measures. The President's secret police and *Porra*, or strong-arm squads, continually hunted down Oppositionists, broke up their secret meetings, invaded homes and offices, held suspects incommunicado in military prisons while submitting them to torture to secure information concerning their associates. It was conservatively estimated that since the 1931 revolt, between 150 and 200 Machado opponents had been assassinated under the cloak of the *ley de fuga* (law of flight), permitting the police to shoot offenders resisting arrest or attempting to escape. The jails were filled with political prisoners, while in Miami, Fla., New York City, and other foreign cities large groups of exiles worked incessantly for Machado's overthrow.

The struggle raged with increasing ferocity from January, 1933, until August 11, when the Army withdrew its support from the President. Then the Machado régime collapsed and a long-oppressed people wreaked its vengeance upon its oppressors.

In January, there were additional murders under the *ley de fuga*. The bullet-riddled bodies of several students were found in Havana streets. The Spanish Embassy, claiming that one of them was a Spanish citizen, demanded the punishment of the policemen responsible for his death. There were street disorders in four cities on January 10, the third anniversary of the assassination of the student martyr, Julio Antonio Mella. English-language newspapers in Havana were placed under the censorship for the first time on January 9 and thereafter American periodicals containing criticisms of the Machado government were excluded from the Cuban mails.

February found guerrilla bands operating against the government in the interior. They attacked police posts and army patrols, wrecked trains and railway bridges, and burned extensive cane fields. Guerrilla activities increased alarmingly during March and April, while in Havana and other cities terrorism on both sides assumed more savage forms. The chief of the *Porra* was shot and killed in Havana, March 11, and new bombings were followed by the arrest of some 75 Oppositionists. The assassination of a Havana military supervisor on April 6, a score of bomb explosions in Havana April 13 and 14, and the execution of several students on the streets shortly afterward brought Havana to the verge of open rebellion. A correspondent of the New York Times watched while Negro sharpshooters posted on cliffs dominating a Havana street shot down two students who had been ejected from a Secret Service automobile and told to run.

Meanwhile the economic depression deepened and the financial straits of the government grew more critical. Government revenues had declined from \$87,000,000 in 1926-27 to about \$38,000,000

in 1932-33, despite heavily increased taxation. The army of 12,000 men, upon which Machado depended for his continuance in power, was costing \$10,000,000 annually. The public debt, which had doubled under Machado's administration, required large additional sums for interest and amortization. There were no funds in the Treasury to meet debt payments aggregating \$15,000,000 due June 30, 1933. Accordingly, Congress on March 31, authorized the President to declare a moratorium on foreign debts. The salaries of teachers and all other public servants, except the Army, were far in arrears.

By the end of May several thousand men, in widely scattered bands, were under arms against the government in the interior. The army had definitely failed to restore order, despite summary hangings and shootings by Maj. Arsenio Ortiz, who had been sent by Machado to crush the insurrectionary bands. The position of the government was becoming increasingly difficult when Sumner Welles, the new American Ambassador replacing Harry F. Guggenheim, arrived in Havana May 7, with instructions from President Roosevelt to end the Cuban turmoil, if possible, without precipitating American intervention.

AMERICAN MEDIATION. Coincident with the arrival of Ambassador Welles, President Machado released 51 political prisoners and transferred the censorship of the press from the Army to the Department of the Interior. Oppositionists charged that these gestures were designed to favorably impress Mr. Welles. Soon after his arrival, the Ambassador offered his services as mediator between the government and the Opposition. On June 15, both the government and the A.B.C. revolutionary organization—the most militant of the Opposition elements—accepted his good offices. Subsequently all Opposition groups except the Menocal Conservatives and the students agreed to negotiate a settlement. Representatives of the Opposition groups first met with Mr. Welles and reached an agreement upon the Constitutional reforms which they demanded of the government. Representatives of the government and of the Opposition parties then met under Mr. Welles' guidance to weld the Constitutional reforms into definite shape for adoption by Congress.

Before these negotiations could succeed, the Ambassador's carefully planned mediation efforts were frustrated by the action of Machado and the outbreak of a general strike during the first week of August. The President had made strenuous efforts to reach a settlement under which he would be permitted to serve out his term of office. On June 7 he promulgated his detailed plans for constitutional reform. They called for the restoration of the office of Vice President, the selection of a neutral to fill that position, and a new electoral code to be drawn up by Prof. Howard Lee McBain of Columbia University. He promised that Opposition political parties would be allowed full freedom to organize. Assassinations were ended, the censorship was raised, and more political prisoners were freed.

Except in the interior, where disorders continued, the main Opposition groups accepted the truce and terrorism subsided during the course of the peace negotiations. On July 26, President Machado announced the restoration of constitutional guarantees as a requirement for the continuance of the negotiations. In doing so he reiterated to the Senate his determination to re-

main in office until May 20, 1935. The Opposition groups, however, were unanimous in insisting upon his immediate resignation. The Ambassador's plans called for Machado's retirement in about six months, after the election of a Constituent Assembly and of a Vice President, who would succeed the President in office. Unwilling to relinquish his power without a struggle, Machado now sought to frustrate the American Ambassador's efforts. A barrage of opposition to the negotiations was raised in Congress. Opposition leaders were again harassed. An atmosphere of distrust obstructed the progress of the discussions. Then on August 2 occurred the strike of Havana street-car operators, which quickly spread to other industries and cities. By August 4 a general strike had paralyzed business throughout Cuba. The laboring classes took the fate of Machado out of the hands of the political negotiators.

DOWNFALL OF MACHADO. Ostensibly a sympathetic strike on behalf of the omnibus operators, the walkout was obviously aimed at the Machado administration. Thousands of Cubans who had seen Machado repudiate previous promises of reform and who had grown pessimistic over the prospects of the American ambassador's mediation, joined in the general strike as a protest against their government. Teachers, students, and doctors joined the laborers in passive resistance. The threats of the police failed to open the shop doors. Apparently hoping to break the strike by stirring the populace to violence and then crushing the outbreak, the government sent armed squads in automobiles through the city, firing into the air. The *Porra* commenced to hunt down Oppositionists once more. On August 7 Congress suspended constitutional guarantees. The same day an erroneous report that Machado had resigned was broadcast by radio, allegedly by one of the President's agents. The people, pouring into the capitol square with joyous shouts of "Long Live Free Cuba," were fired upon and dispersed by the *Porra* and the troops. Thirty persons were killed and more than 100 wounded.

On the same day Ambassador Welles, seeking to avert further bloodshed, presented the President with a memorandum urging him to appoint a man acceptable to all parties as Secretary of State and then to depart from Cuba on a leave of absence. The Secretary of State would then assume the Presidency, form a National cabinet, and undertake the restoration of constitutionalism and peace. Machado angrily rejected the proposal, called upon the people to fight against American intervention, and threatened to defend Cuba's sovereignty with the army. The people, unimpressed, continued the general strike.

Then came the decisive action of the army, motivated by the conviction that Machado intended to provoke American intervention. On August 11 the younger officers in the Cabana fortress at Havana defied their superiors and assumed control of the fortress. Then, under Lieut.-Col. Erasmo Delgado, they seized the Army headquarters in Havana and gave President Machado 48 hours to resign and leave Cuba. Unable to rally any of the officers to his assistance, Machado capitulated. He accepted the resignation of all Cabinet members except Secretary of War Alberto Herrera, signed his own leave of absence, and fled by airplane in the afternoon of August 12 to Nassau in the Bahamas, later going to Montreal, Canada. General Herrera automatically

became acting President, but the Army realizing that his presence in the office would mean further bloodshed, demanded a civilian. Herrera was forced to appoint Dr. Carlos Manuel de Cespedes as his Secretary of State and then to resign, leaving de Cespedes free to reorganize the government.

Machado's flight was followed by three days of delirious demonstrations throughout Cuba. In Havana mobs sacked the Presidential palace and the homes of Machado's colleagues. They destroyed the tyrant's statues, newspaper, grocery store, and every material vestige of his rule. Armed bands of A.B.C. members and other Oppositionists hunted down the hated members of the *Porra*, shooting them on sight. Within a few days 75 of Machado's henchmen had been killed and some 200 wounded in Havana; others remained in hiding or fled hastily to foreign ships or embassies.

With the consent of Provisional President Cespedes, President Roosevelt on August 13 sent three destroyers to Havana to protect American lives and extend moral support to the new government, which the United States immediately recognized. The general strike was terminated on August 14 and rioting subsided so that the last American destroyer was withdrawn August 18.

THE CESPEDES GOVERNMENT. Dr. Cespedes was the son of the father of Cuban independence and a lawyer, writer, and diplomat who held the confidence of the bulk of the Opposition groups. He formed a Cabinet of able and honest men, representing the various anti-Machado groups. During its short tenure of office, the Cabinet worked indefatigably to restore order and earned the approval of a large section of the public. Finding it impracticable to continue the guise of constitutionalism, it declared itself frankly revolutionary by a decree of August 24, dissolved Machado's Congress, annulled the constitutional reforms of 1928 by which Machado had extended his term of office, and restored the constitution of 1901. A consultative assembly was appointed to aid the Cabinet pending the election of a new Congress and President, set for Feb. 24, 1934. Discipline was restored in the army, serious strikes of railway operatives and Havana dock workers were settled, and the mob spirit in Havana was curbed. Throughout, the Cespedes government worked in close cooperation and sympathy with the American Ambassador.

REVOLT OF THE ARMY PRIVATES. On September 5, a revolt of the army rank and file, led by Sergeant Fulgencio Batista and instigated by the students and the radical wing of the university professors, overthrew the Cespedes government. The army privates were discontented with the prospects of a reduction in their numbers and wages. The students and radical elements were dissatisfied with the government's slow progress toward constitutional reform, its alleged subservience to the United States, its insistence upon orderly judicial procedure against Machado's adherents instead of their summary execution. Finally, there was the students' conviction that corrupt and discredited politicians were worming their way into office and that the Conservatives on one hand and the Communists on the other were conspiring to overthrow the government.

The insurgents followed the same procedure by which their superiors had overthrown Machado a month earlier. They seized control of the

Cabanas fortress and of the Havana army headquarters, displaced their officers, and replaced the Cespedes Cabinet with a junta of five intellectuals, led by Prof. Ramón Grau San Martín of the University of Havana. Other members of the junta were Dr. Guillermo Portela, also a Havana University professor; Porfirio Franco, a business man; José M. Irizarri, a young lawyer; and Sergio Carbo, a newspaper editor.

The new government assumed power without bloodshed, but with little public confidence and support. It was dominated by the immature student radicals, who were honest, high-minded, and passionately determined to free Cuba both from political corruption and tyranny and from subservience to the United States. Opposing it were the army officers, the A.B.C., another revolutionary group called the O.C.R.R., all the old political parties, a strong section of the professors, the Communists, and the more radical labor organizations. Another formidable handicap was the failure to secure recognition from Washington.

ROOSEVELT AVOIDS INTERVENTION. The *coup d'état* of September 5 apparently took Washington by surprise. Fearing that it presaged widespread disorders, the Roosevelt Administration dispatched about 30 war vessels to Cuban waters, concentrated 1000 marines at Quantico, and announced that Secretary of the Navy Swanson was en route to Havana. The State Department stated that intervention was not contemplated and that these moves were solely for the protection of the 6000 American citizens in Cuba. Washington's action, however, aroused resentment in some Cuban circles and much criticism in the United States and Latin America. President Roosevelt met this criticism by ordering Secretary Swanson not to land at Havana and by assuring the diplomatic representatives of Argentina, Chile, Brazil, and Mexico at a White House conference that he would take all possible steps to avoid intervention. Secretary of State Hull announced September 11 that the United States would "welcome any (Cuban) government representing the will of the people of the republic and capable of maintaining law and order throughout the island. . . ." The warships remained in Cuban waters during the critical weeks which followed.

THE STUDENT-ARMY GOVERNMENT. From the outset, the junta established by the student-army revolt was forced to rely upon the army for its continuance in office. After unsuccessful efforts to win the support of other revolutionary groups, the junta relinquished power on September 10, delegating all authority to Dr. Grau San Martín, who was named Provisional President. The Provisional President, however, faced the same opposition as had the junta. He and his cabinet were controlled by a directorate of students and professors, uncompromisingly determined to carry through a social revolution along intensely nationalistic and socialistic lines. They opposed both communism and fascism. Their model was the revolutionary republican régime in Spain.

On September 14, decrees were issued establishing a dictatorial régime pending the drafting of a new constitution at a convention for which elections were to be held "as soon as possible." The following day the President and his student colleagues initiated negotiations with Opposition groups for the formation of a coalition Cabinet. The students refused the unanimous demand of

the opposing elements that Dr. Grau San Martín resign and a deadlock ensued. While the students strove desperately to win over opposing groups, retain the fickle support of the army, and carry on governmental functions, Communist agitators gained increasing influence over the labor unions. The A.B.C. and other groups continued in passive opposition, but in the interior sporadic uprisings and disorders kept the government on edge. In various parts of the island laborers seized control of American and other foreign-owned sugar plantations and properties, bringing the threat of American intervention. The deposed army officers, armed and concentrated 521 strong in the National Hotel in Havana, rejected all overtures from the Grau government and demanded the restoration of Dr. Cespedes' coalition Cabinet.

Meanwhile the economic life of the island was in a large measure paralyzed. Business was at a standstill, credit was frozen, and bills and taxes remained unpaid. The government was practically without revenue.

The students acted vigorously to check the tide of opposition. They organized their own militia, and with the aid of the Army put down several attempts at insurrection in the provinces. On September 16 the student directorate sent half its members to organize the government throughout the island. In Havana a number of Opposition leaders were arrested and accused of conspiring against the government. A virulent Communist agitation in the capital was curbed on September 20, when troops broke up a great Red demonstration. Six persons were killed and 27 wounded in the accompanying riots. Thereafter the Communist agitation was rigorously suppressed.

The Grau government was further strengthened by the Army's victory in a clash with the deposed officers on October 2. After an all-day struggle, in which 100 were killed and 250 wounded, the officers surrendered. Despite extensive damage to the American-owned National hotel, which the officers used as a fortress, and the accidental killing of an American onlooker, the United States held steadfastly to its non-intervention policy.

The long expected break between the A.B.C. and the student-army groups occurred on the same day as the battle with the army officers. Following the surrender of the officers, there was extensive street fighting in Havana, with armed groups in automobiles firing upon the troops, police, and other supporters of the government. These outbreaks were attributed to the regular A.B.C. organization, as distinguished from the A.B.C. Radical faction, which continued to support the government. The following day the government rounded up many A.B.C. members, including Dr. Miguel Mariano Gomez.

Violent opposition to the government increased after the student directorate and the army on October 10 ended all hope for the formation of a coalition government by announcing their determination to retain the Grau government in office until the constitutional convention scheduled for May 20, 1934. Former President Mario G. Menocal, head of the Conservative party; the A.B.C. leader, Joaquin Martinez Saenz; and other Opposition party heads signaled the end of political negotiation by taking refuge in the United States. On October 14, Col. Fulgencio Batista, head of the army since the revolt of

September 5, called on all the civilian armed groups to lay down their arms.

Shortly afterward the defection of the A.B.C. Radicals from the Grau régime was reported. The beginning of November found Havana again in a state of tension reminiscent of the last days of the Machado administration. There were general strikes against the government's "repressive methods," a series of terroristic bombings, and serious defections from the Grau government among the students, who had heretofore been its most vigorous supporters.

A second revolt against the Grau San Martín government was launched in Havana by supporters of Dr. de Cespedes on November 8. The rebel groups included some sergeants and privates of the air corps, members of the A.B.C., the garrisons of Forts Dragones, Atares, and San Ambrosio, the Havana police, and many unorganized civilians. Most of the army and navy remained loyal to the student-army government, however. After two days of heavy fighting in the Havana streets, the main body of rebels, concentrated in Fort Atares, were forced to capitulate before an artillery bombardment. Their commander, Col. Juan Blas Hernández, a popular guerrilla leader in the anti-Machado struggle, was killed in the fighting. The government forces were again victorious in street fighting with the remnants of the rebels on November 11, bringing to an end the revolt, which had cost some 300 lives.

Successful in the Havana fighting, the government was able to retain control of the capital until the end of the year. It was unable to restore order throughout the provinces, where numerous uprisings had occurred in connection with the Havana revolt. A state of underground warfare continued in Havana, with sporadic bombings, sniping, and arrests of Opposition leaders. Meanwhile negotiations for a working agreement between the government and the Opposition were continued, the principal effort being made by the Uruguayan Minister to Cuba, Dr. Fernández Medina. The formulas offered called for the resignation of Dr. Grau San Martín and the formation of a coalition government, conditions unacceptable to the Provisional President. On December 11 he broke off the negotiations, asserting he had no intention of resigning.

Thereafter the radical faction gained the ascendancy in the Grau San Martín régime. This change was marked by the resignation on December 22 of three conservative members of the cabinet and by a series of presidential decrees which furthered the government's radical economic policies. The decrees were aimed mainly at foreign-owned sugar mills and public utilities, as well as at large employers of Cuban labor. One decree ordered all concerns in Cuba to employ at least 50 per cent Cuban labor. This measure threw thousands of Spaniards in Cuba out of work and resulted in a protest demonstration on December 17 in which four were killed and 10 wounded. Another decree of December 6 ordered the American-owned Compañia Cubana de Electricidad to reduce its rates 45 per cent without reducing either personnel or salaries. Two large American-owned sugar mills were seized by the government on December 21. Meanwhile radical labor groups, through strikes and violence, were demanding extensive concessions from foreign companies. Colonel Batista appeared to be the chief advocate of moderation within the government.

Despite its domestic difficulties, the Grau San

Martin government continued to meet the monthly debt instalments due in New York on Cuban foreign obligations. On December 31, however, it defaulted on service charges totaling \$4,718,860 due New York banks on public works loans contracted by the Machado administration.

Despite the continued disorders in Cuba and pressure brought to bear from both Cuban and American business interests there, the United States government persisted in its decision not to intervene. On the other hand, it was equally adamant in refusing to recognize the Grau San Martín régime, although bitterly attacked by Cuban delegates to the seventh Pan-American Conference and by many American liberals on this score. Due to the antagonism of the Grau régime, the position of Sumner Welles as United States representative in Havana became increasingly difficult. After a long conference with Mr. Welles at Warm Springs, Ga., on November 19, President Roosevelt on November 24 announced the early withdrawal of the American envoy and his replacement by Jefferson Caffery, Assistant Secretary of State. Mr. Roosevelt expressed the hope that the Cubans soon would unite behind a provisional government so as to warrant recognition by the United States. He intimated that the United States was prepared to modify the permanent Cuban-American treaty, which included the Platt Amendment, and to conclude a new commercial pact. Mr. Caffery was greeted with cheers when he arrived in Havana December 18.

A general assembly which meets annually is the supreme judiciary, the 1933 meeting being held in Memphis, Tenn., June 14-19. In 1933 there were 1178 churches, reporting 758 ministers and a church membership of 69,516, in the denomination's 10 synods and 62 presbyteries. The Sunday school enrollment was approximately 52,250. The property of the church was valued at \$3,356,537, not including a \$500,000 endowment for education.

Missionary work is carried on among the Indians in the United States, in China, and South America. The denomination maintains Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. Its official organ is the *Cumberland Presbyterian*. The Rev. W. B. Cuninghame, D.D., of Union City, Tenn., was moderator of the general assembly in 1933, and the Rev. D. W. Fooks of Nashville, Tenn., was stated clerk and treasurer.

CUNO, ku'no, (CARL JOSEPH) WILHELM. A German industrialist and statesman, died at Aumuehle, near Hamburg, Jan. 3, 1933. He was born at Suhl, Thuringia, July 2, 1876, and was educated at the Universities of Berlin, Heidelberg, and Breslau, specializing in jurisprudence. After practicing in the Berlin courts he became counselor with the Prussian Finance Ministry in 1907 and in 1912 was made Privy Counselor. During the World War he was director of the grain organization of the Food Ministry, but resigned this post in 1917 to become a member of the board of directors of the Hamburg-American Shipping Line, and on the death of Albert Ballin in 1918 became its general director. He was economic expert for the German delegation at the Paris Peace Conference and at subsequent conferences in Brussels, Geneva, and Spa.

Dr. Cuno became Chancellor of Germany in November, 1922, but criticism of his policy of passive resistance to the French and Belgian military occupation of the Ruhr, and of the disastrous inflation of the mark, led to the resignation of his ministry in August, 1923. He then resumed the directorship of the Hamburg-American line, devoting his energies to the post-war rehabilitation of this line which he had inaugurated before accepting the chancellorship. By the terms of the Treaty of Versailles the aggregate tonnage of the shipping firms of Hamburg had been reduced from 1,643,000 tons in 1913 to 82,000 tons in 1918. Dr. Cuno was a leader in the spectacular revival of the fortunes of the port of Hamburg, having increased the tonnage of ocean shipping of his own line from 4000 tons in 1918 to 300,000 tons in 1922. In 1929 he formed with Lord Reading the Anglo-German Shipping Association and enlarged the field of the Hamburg-American Line by extending its operations to the western coast of the United States.

CURACAO, koo'ra-sä'ō or kūrā-sō'. A colony of the Netherlands in the West Indies comprising two groups of islands about 500 miles apart, one group consisting of the islands of Curaçao (210 square miles; 45,191 inhabitants on Jan. 1, 1932), Bonaire (95 square miles; 5805 inhabitants), and Aruba (69 square miles; 16,689 inhabitants) is just north of Venezuela; the other group consisting of the southern part of the island of St. Martin (17 square miles; 2568 inhabitants), and the islands of St. Eustatius (7 square miles; 1004 inhabitants), and Saba (5 square miles; 1512 inhabitants) is just west of the Virgin Islands. Total area, 403 square miles; total population, 71,769. Willemstad, the capital city on the island of Curaçao had a population of 20,972. In 1931 there were 2405 births, 502 marriages, and 1266 deaths. For the same year there were 44 schools with 10,432 students.

The chief products are maize, beans, pulse, cattle, phosphate of lime, and salt. Oil refining is the principal industry. Total imports for 1931 were valued at 248,101,115 guilders (guilder equals \$0.402 at par); exports were valued at 242,861,330 guilders. For the budget of 1933, revenue was estimated at 7,298,250 guilders and expenditure, at 5,727,702 guilders. There were 10,959 vessels aggregating 45,961,170 tons entered the ports in 1931. The colony is administered by a governor assisted by a council of 4 members and a colonial council of 13 members, all nominated by the sovereign. Governor in 1933, B. W. T. van Slobbe.

CURLING. The Gordon International Medal, signifying curling supremacy, was won in 1933 for the fourth consecutive time by Canada. The Canadians showed a marked superiority over the United States players. The Canadians won the annual tournament (curling is practically lawn bowling on ice) 259 to 194. The National Gordon Medal, vied for by United States teams, went to the Caledonians of New York, composed of George V. Cobban, James Whyte, P. F. Gilmarth, and W. Culbertson, skip. The Utica Country Club captured the Emmett Medal, downing St. Andrews of New York in the final. The Caledonia Club of New York won the Clyde Park Trophy and another Utica team rink won the Stockton Trophy. The Canadian championship saw the defeat after five years of the Manitoba team, which bowed in the final, 11 to 3, to the Edmonton Royals.

CURRENCY. See COINS, VALUE OF; FINANCIAL REVIEW; MONEY; UNITED STATES.

CURRICULUM. See EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES.

CURRIE, SIR ARTHUR WILLIAM. A Canadian soldier and educator, died in Montreal, Nov. 30, 1933. Born at Napperton, Ont., Dec. 5, 1875, he attended the Strathroy (Ont.) Collegiate Institute and from 1894 to 1900 taught school at Sidney and Victoria, B. C. He then became engaged in the real estate and insurance business in Victoria and was also president of a mining corporation. On joining the fifth regiment of the garrison artillery in 1897, he thereafter made service in the Canadian militia his avocation, being commissioned lieutenant in 1900 and commander of the regiment nine years later. In 1913 he was assigned to the command of the 50th regiment of the Gordon Highlanders of Canada, with the rank of lieutenant colonel.

On the outbreak of the World War Sir Arthur was appointed commander of the second infantry brigade of the Canadian Expeditionary Forces, being promoted after the arrival of the troops in France to the rank of colonel and then to brigadier general. In the latter capacity he was engaged in those battles of the British offensive in which the Canadian contingent especially distinguished itself, namely the second battle of Ypres (April, 1915), in which poison gas was used by the Germans for the first time in warfare, Festubert (May, 1915), and Givenchy (June, 1915). As commander after September, 1915, of the First Canadian Division, with the rank of major general, he participated in the battles of Mt. Sorrel (June, 1916); the Somme (September-October, 1916); and in the first battle of Arras (April, 1917) directed the storming of Vimy Ridge which resulted in the capture of 4000 prisoners and large quantities of war materials. In June, 1917, he succeeded General Byng as commander of the Canadian Corps in France, with the rank of lieutenant general, transferring its operation to Belgium where it participated in the capture of Passchendaele during the battle of Flanders.

During the closing Allied offensive of the War the Canadian forces were used as shock troops and distinguished themselves by piercing the Hindenburg line, not only capturing during the second battle of Arras (August-September, 1918) Wancourt, Monchy-le-Preux, Cherisy, Vis-en-Artois, and the Bois-du-Sait, but smashing the Quéant-Drocourt sector of the line. The Hindenburg line itself was broken in the capture of Cambrai (October, 1918) and of Valenciennes and Mons

(November, 1918). Sir Arthur commanded also the Canadian forces during the occupation of the Rhine in 1919. On his return to Canada he was promoted to the rank of general and was made inspector-general of the Canadian militia and principal military councillor.

Sir Arthur served after 1920 as principal and vice-chancellor of McGill University. In 1928 he won the libel suit which he brought against the Port Hope (Ont.) *Guide* and W. T. R. Preston, the author of the article "Mons," which charged that Sir Arthur had wasted the lives of his soldiers without reason on Nov. 10 and 11, 1918, in the 24 hours before the Armistice became effective. Among his decorations were the American Distinguished Service Medal, the French Croix de Guerre with palms, and the Croix de Guerre of Belgium. He was created a Companion of the Bath (1915), Knight Commander of St. Michael and St. George (1917), Knight Commander of the Bath (1918), Knight of the Grand Cross of St. Michael and St. George (1919), Grand Officer of the Order of the Crown of Belgium, and Commander of the French Legion of Honor.

CURTIS, CYRUS H (ERMAN) K (OTZSCHMAR). An American publisher and philanthropist, died at Wyncote, Pa., June 7, 1933. He was born in Portland, Me., June 18, 1850, and received his education in the public schools of that city. His future career was determined by his success at the age of 15 with a four-page boys' weekly entitled *Young America*, which he published on a small hand press, purchased out of the profits of his newspaper sales, and which achieved a circulation of 100 copies. He worked in a Portland dry goods store during 1867-70 and then went to Boston where he acted as advertising solicitor for the *Times*. He thrice attempted to enter the publishing field, with the *People's Ledger* in 1872, the *Boston Independent* in 1874, and, after removing to Philadelphia, the *People's Ledger*, *Boston* and *Philadelphia* in 1876. The first venture was wiped out by fire, while the other two did not succeed in weathering the perilous first year. His efforts were finally crowned with success with the establishment in 1879 of a weekly entitled the *Tribune-Farmer*. Associated with him were his brother-in-law, Hamilton Mayo, a Massachusetts banker, and Thomas Meehan, the distinguished horticulturist, who served as editor. Within two years the paper's circulation had reached 48,000 copies weekly.

The *Tribune-Farmer* was devoted primarily to agricultural topics, but a special feature was the woman's page, of which Mrs. Curtis assumed guidance. After 1883 it was issued as a separate supplement entitled the *Ladies' Home Journal*, its success leading Mr. Curtis to sell his interest in the *Tribune-Farmer* the following year and concentrate on its development. Mrs. Curtis continued to edit the *Journal* until 1889, when it passed under the direction of Edward W. Bok who made it one of the most popular magazines in the United States. Attaining a circulation of 2,000,000 copies monthly, it exerted a great influence in raising the standards of taste of women of the American middle class and in interesting them in bettering the conditions of their homes. In 1891 Mr. Curtis organized the Curtis Publishing Co., of which he was president until 1932 and chairman of the board at the time of his death.

The next phase in Mr. Curtis's publishing career

was the purchase in 1897 of the almost defunct *Pennsylvania Gazette*, founded in 1728 by Benjamin Franklin. He renamed the publication the *Saturday Evening Post* and employed a young Boston reporter, George Horace Lorimer, as editor. Its early circulation appeal was "Success for the men and romance for the women." Mr. Curtis stated that he spent a million dollars in advertising the periodical before it began to pay for itself, but its historical associations as the oldest weekly newspaper in the United States were successfully utilized and after the corner was turned it became not only the most profitable but the most influential of American weeklies. By 1902 it had attained a circulation of more than 500,000 copies weekly, while 30 years later it boasted a circulation five times as large. Mr. Curtis's third venture in the periodical field was the *Country Gentleman*, which he purchased in 1911 and moved from Albany to Philadelphia where he built up its circulation to 600,000 copies weekly.

In 1913 Mr. Curtis decided to enter the newspaper field once more, purchasing the Philadelphia *Public Ledger*, to which he added an evening edition in 1914. He later acquired the Philadelphia *Evening Telegraph* (1913), the Philadelphia *Press* (1920), and the Philadelphia *North American* (1925), which were merged with the *Public Ledger*. In 1923 he entered the New York field through the purchase of the *Evening Post*, and in 1930, through the Curtis-Martin Newspapers, Inc., which he headed in association with his stepson-in-law, John C. Martin, bought the Philadelphia *Inquirer*, the largest newspaper in Pennsylvania. His motto was: "Give the public the best it knows."

Mr. Curtis was a generous contributor to educational institutions, outstanding among his gifts being \$1,000,000 to the University of Pennsylvania, \$950,000 to Bowdoin College, \$850,000 each to Drexel Institute and Temple University, \$400,000 to Ursinus College, and \$100,000 to Wellesley College. Also he contributed \$1,500,000 for the construction and endowment of the Curtis Clinic of the Jefferson Medical College, and in 1930 gave the same amount to the Benjamin Franklin Memorial and Franklin Institute Museum in Philadelphia erected in 1932.

Mr. Curtis was greatly interested in art and in music, his personal art collection including some of the world's most noted paintings. The pipe organ was his favorite instrument, and not only did he have a splendid instrument in his home but he presented organs to various universities, churches, and institutes, the one given by him to the University of Pennsylvania, known as the Sesqui-Centennial organ, ranking fourth in size in the world. In 1924 he founded in Philadelphia the Curtis Institute of Music, whose permanent endowment on the appointment of Josef Hofmann as director three years later was increased to \$12,500,000.

In his later years Mr. Curtis spent much of his time on his yacht, the *Lyndonia*, being accustomed to hold conferences of his executives at such ports of call as Portland, Boston, and New York. He was also a member of the board of directors of the First National Bank of Philadelphia, the Mutual Life Insurance Co. of New York, and the Academy of Music Corp. In 1930 he received the gold medal bestowed annually by the Pennsylvania Society upon the "most characteristic American," while the Harvard Gradu-

ate School of Business Administration awarded him the Bok gold medal in recognition of the service he had rendered in maintaining a high advertising standard. His son-in-law, Edward Bok, told the story of his career in *A Man from Maine* (1923).

CYCLING. Besides the fact that the list of cycling titleholders was almost completely revised in 1933, the year was noteworthy for the revival of interest in bicycling for entertainment. In the spring and summer there were scenes reminiscent of the early days of the century when in all large cities throughout the United States throngs went bicycle riding. Bicycle sales mounted and renting shops did a brisk trade.

In the championship lists there were only two holdover champions, one a world's champion and the other a United States titleholder. Joseph Scherens of Belgium successfully turned back repeated challenges to retain his world's professional sprint crown, and Alfred Letourner, French star, kept his United States professional motor-paced title honors. Georges Spicher of France succeeded Alfred Binda as world's professional road champion and Charles Lacquehay of France displaced his compatriot, Georges Paillard, as world's professional motor-paced champion. The amateur sprint championship of the world went to Jacobus Von Egmond of Holland who succeeded Albert Richter of Germany, and Paul Egli of Switzerland won the world's amateur road title.

Norman Hill, San Jose, California rider, won the national professional all-around crown, displacing Cecil Walker, who had held the title eight times. Eddie Miller of New York City took the national amateur sprint honors, succeeding Tino Reboli as titleholder. George Dempsey, Australian, took the national professional sprint laurels, also displacing Walker.

Letourner and William (Torchy) Peden, Vancouver cyclist, shared honors in the six-day field. Teamed with Gerard Debaets of Belgium, Letourner won the race in Madison Square Garden in New York in March and in December won with Peden as his partner. Peden's triumph with Letourner was his eighteenth of his two-year-old career. Peden won five other six-day races throughout the United States and Canada in the course of the year.

Cycling was popular with spectators and the six-day races and the one-day matinees held throughout the country were well attended and were money makers for the promoters.

CYPRUS. A British island colony in the Mediterranean, 60 miles west of Syria and 40 miles south of Turkey in Asia. It was ceded to Great Britain for administrative purposes by Turkey in 1878, formally annexed by Great Britain on Nov. 5, 1914, and given the status of a British colony, May 1, 1925. Total area, 3584 square miles; total population (1931 census), 347,959, of whom 283,562 were Christians and 64,238 were Moslems. The estimated total population on Jan. 1, 1933 was 314,215. Births in 1932 numbered 10,117; deaths, 5745; marriages, 1747. Chief cities: Nicosia, the capital and principal trading centre, 23,677 inhabitants in 1931; Limassol, 15,349; Larnaca, 11,872; Famagusta (including Varosha), 9979. In the school year 1931-32 there were 1963 schools for primary education with a total enrollment of 53,010. There are many government-aided secondary schools managed by local committees.

The 1932 production of the principal agricul-

tural products was grapes and grape products, valued at £281,844; wheat, 1,144,242 bushels valued at £266,990; barley, 1,331,424 bushels valued at £147,935; carobs (beans), 38,555 tons valued at £96,387; potatoes, 442,864 cwt. valued at £55,357; oranges, lemons, and other citrus fruits, valued at £41,360; olives and olive oil, valued at £31,292; onions, valued at £15,843; cotton, valued at £11,849. Various other fruits are grown for home consumption. Sponge fishing is a minor industry. The mining of copper ore, asbestos, gypsum, terra umbra, and chromite is extensively carried on. For 1932, imports were valued at £1,347,288 of which £508 represented bullion; exports, £922,426, including £2746 for bullion.

The total revenue for 1932 amounted to £886,560; expenditure, £872,743; public debt, £615,000. Cyprus is administered by a governor aided by an executive council. Because of the riots which occurred in the colony near the end of 1931, the legislative council was abolished by Letters Patent (Nov. 12, 1931), and power to make laws was granted to the governor. Sir H. R. Palmer became governor and commander-in-chief during the latter part of 1933. See ARCHÆOLOGY.

CYRENAICA, sir'è-à'íkà. (CIRENAICA).

A district of Italian Libia in north Africa, bounded on the east by Egypt and north by the Mediterranean Sea. Area, about 75,340 square miles; including the hinterland (Cufra zone), 285,640 square miles. Population (1931 census), 164,607 of whom 18,861 were Europeans (chiefly Italians), and 139,193 were Moslems. Benghazi, the capital, had 43,000 inhabitants in April, 1931. Cattle raising, agriculture, fishing, and salt refining are the principal industries. Many colonists from Italy have settled on the land, the cost of transportation was furnished by a government commission.

In 1931, imports were valued at 146,945,540 lire (lira equals \$0.0526 at par); exports, 19,340,670 lire. The budget for 1932-33 was estimated to balance at 231,280,000 lire. Highways completed on Aug. 1, 1932 totaled 380 miles. There were 106 miles of railway open to traffic in 1930-31, and 106,563 passengers and 145,975 metric tons of freight were carried. During 1931, 1170 vessels aggregating 1,076,081 tons entered the ports, and 1153 vessels aggregating 1,072,900 tons cleared. The military force in 1932 was made up of 361 officers, 662 non-commissioned officers, and 9218 men (7163 natives; 2055 Italians). Governor with headquarters in Tripolitania, Marshal Italo Balbo, appointed Nov. 6, 1933; Lieutenant-Governor of Cyrenaica, Gen. R. Graziani. See TRIPOLITANIA.

CZECHOSLOVAKIA, chek'ò-slò-và'kì-à. A central European republic established Oct. 28, 1918. Capital, Praha (Prague).

AREA AND POPULATION. The area and census population by Provinces is shown in the accompanying table.

AREA AND POPULATION OF CZECHOSLOVAKIA

Province	Area, sq. miles	Population	
		1921	1930
Bohemia	20,102	6,670,582	7,109,376
Moravia and Silesia ..	10,334	3,335,152	3,565,010
Slovakia	18,882	3,000,870	3,329,865
Ruthenia	4,877	606,568	725,381
Total	54,195	13,613,172	14,729,632

The estimated population on Jan. 1, 1932, was 14,823,000. In 1932 there were 312,351 living

births, 210,352 deaths, and 127,593 marriages, the birth rate per 1000 of population being 21, and the death rate 14.1. By nationality the 1930 population (excluding Slovakia) was divided as follows: Czechoslovaks, 7,345,137; Germans, 3,088,530; Hungarians, 119,469; Russians, 458,095; Poles, 80,182; Jews, 120,277; aliens, 238,808. The final census returns for the chief cities in 1930, with 1921 figures in parentheses, were: Praha (Prague), 848,823 (676,663); Brno (Brünn), 264,925 (221,758); Moravská Ostrava, 125,347 (113,709); Bratislava (Pressburg), 123,884 (93,189); Plzeň (Pilsen), 114,704 (108,023). The religious distribution of the population (1930) was: Roman Catholics, 10,833,423; Protestants, 1,109,229; Greek and Armenian Catholics, 585,439; Orthodox Greek, 145,583; Jews, 356,768.

EDUCATION. Elementary education is compulsory between the ages of 6 and 14 years and there is almost no illiteracy, except in Slovakia. In October, 1931, there were 15,064 public and private elementary schools, with 1,793,356 pupils (895,967 boys and 897,389 girls). Secondary schools included 349 Latin and technical schools, with 93,608 pupils; 5 foreign Latin and technical schools, with 718 pupils; and 188 public schools of commerce, with 34,841 pupils. There were four universities (2 Czech, 1 German, and 1 Slovak), with 20,444 students, and four technical high schools (2 Czech and 2 German), with 10,568 students.

PRODUCTION. A rich agricultural, mining, and lumbering country, Czechoslovakia has also in the northwestern part one of the most advanced industrial regions in Europe. Beet sugar production for the 1933-34 season was estimated at 561,090 metric tons (632,959 metric tons in 1932-33). Production of other leading crops in 1932, with 1931 figures in parentheses, was (in 1000 quintals of 220.46 pounds): Wheat, 14,625 (11,222); rye, 21,759 (13,877); barley, 15,049 (10,746); oats, 16,639 (12,246); corn, 3093 (2277); potatoes, 92,763 (97,263); sugar beets, 39,614 (52,408). Tobacco, hops, wine, flax, and hemp are other crops. Livestock at the beginning of 1932 included 4,450,965 cattle, 2,464,616 cows, 2,575,921 swine, and 531,125 sheep.

Mineral and metallurgical production, in metric tons, in 1932 (preliminary), with final 1931 figures in parentheses, was: Coal, 11,053,000 (13,103,000); lignite, 15,910,000 (17,932,000); coke (excluding coke made from lignite), 1,277,000 (2,046,000); petroleum, 28,000 (20,000); iron ore, 602,000 (1,235,000); pig iron and ferro-alloys, 451,000 (1,165,000); manganese ore, 33,480 (83,883); steel ingots and castings, 682,000 (1,514,000); lead, 4800 in 1931; zinc, 5100 (7900); superphosphates of lime, 130,000 in 1931; salt, 190,000 (178,000). Forests cover 11,347,000 acres, or about 33 per cent of the total area.

Industrial establishments in 1930 numbered 12,033, including 1922 textile mills, 2326 glass works and stone factories, 1807 producing food products, 1407 furniture and bent wood factories, 950 machine factories, 928 metal foundries, 396 paper mills, and 645 chemical plants. Beer, shoes, and artificial silk are other important industrial products. The index of industrial production (base: 1928 = 100) declined from 104 in 1929 to 91 in 1930, 81 in 1931, and 59 in 1932. Industrial production declined approximately 42 per cent between 1929 and 1932, as compared with a world average of 30.6 per cent. Unemploy-

ment, at 636,000 for the end of July, 1933, was 40 per cent higher than for the same date of 1932.

COMMERCE. The decline in Czechoslovakia's foreign trade in merchandise during the period 1930-33 is shown in the accompanying table (in thousands of crowns, worth \$0.0296 at par).

CZECHOSLOVAK IMPORTS AND EXPORTS
[In 1,000 crowns]

	Imports	Exports	Surplus of exports (+) or imports (-)
1930	15,679,969	17,460,423	+ 1,780,454
1931	11,724,897	13,106,340	+ 1,381,543
1932	7,461,453	7,336,026	- 125,427

Leading imports, by value, in 1932 were (in 100,000 crowns): Raw cotton, 552; chemicals and dyes, 401; raw wool, 397; coal and coke, 322; silk manufactures, 259; tobacco, 247; wheat, 244; electric machinery, 214. Leading exports were (in 100,000 crowns): Leather and leather manufactures, 534; iron manufactures, 502; cotton tissues, 413; silk and its manufactures, 366; refined sugar, 350; fruit, vegetables, etc., 343; machines and vehicles, 339.

Germany in 1932 supplied 24.2 per cent of the total imports (28 per cent in 1931); the United States, 11.4 per cent (4.1); Free Port of Hamburg (transshipments), 8.2 per cent (9.7); Austria, 5.5 per cent (7.2); Yugoslavia, 4.8 (3.3); Poland, 4.6 per cent (5.3). Exports went principally to Germany, 16.2 per cent (15.5 per cent in 1931); Austria, 14 (13.7); United States, 6.8 (6.1); United Kingdom, 5.5 (10.3); Yugoslavia, 5.5 (6.3); France, 4.9 (3.5).

FINANCE. The state budget for 1934, as passed by Parliament, provided for revenues of 7,632,000,000 crowns and expenditures of 7,631,000,000 crowns, compared with estimated revenues of 8,634,000,000 crowns and expenditures of 8,633,000,000 crowns in 1933. Closed accounts for 1932 showed a deficit of 943,000,000 crowns in the ordinary and surplus of 692,000,000 crowns in the extraordinary budget, or a total deficit of 251,000,000 crowns. Ordinary expenditures were 9,310,000,000 crowns (final figure), compared with the receipts of 8,367,000,000 crowns. In 1931 there was a deficit of 1,347,000,000 crowns on total expenditures of 12,292,000,000 crowns.

Between Jan. 1 and Dec. 31, 1933, the national debt rose from 37,969,000,000 crowns to 38,737,000,000 crowns, mainly as a consequence of the flotation of an employment loan of 2,010,000,000 crowns and the issuance of new Treasury certificates of 269,663,000 crowns. These increases were offset in part by a reduction of 1,623,205,883 crowns through debt payments, purchases of bonds, and debt adjustments. The net debt increase was 767,649,406 crowns. Service on the debt was estimated at 1,697,455,753 crowns in 1934.

COMMUNICATIONS. Czechoslovakia in 1931 had 8606 miles of railway lines, of which 6002 miles were state owned and 1625 miles privately owned. All railways in 1931 carried 81,500,000 metric tons of freight (94,300,000 tons in 1930) and 294,000,000 passengers (334,000,000 in 1930). The deficit on the operation of the state lines in 1934 was estimated at 819,220,000 crowns (490,806,200 crowns in 1933). Highways in 1931 extended about 49,000 miles (5300 miles of national roads). The Danube, Vltava, and Elbe rivers are impor-

tant traffic arteries. There were 22 air routes in operation in 1931 (16 international and 6 national).

GOVERNMENT. The Constitution of Feb. 29, 1920, vested executive power in a president, elected for seven years by the two chambers of Parliament in joint session. The President appoints and recalls ministers. Legislative authority rests in a senate of 150 members, elected for eight years, and a chamber of deputies, of 300 members, elected for six years. President in 1933, Thomas Garrigue Masaryk, reelected May 27, 1927. Premier in 1933, Jan Malypetr, who headed a coalition cabinet formed Oct. 29, 1932. Foreign Minister, Eduard Beneš.

HISTORY

The Czechoslovak Republic during 1933 was preoccupied with three major problems—economic recovery, preservation of its territorial boundaries as fixed by the peace treaties, and protection of its liberal, democratic institutions against fascism.

THE ECONOMIC PROBLEM. During the first years of the world economic depression (1929-31), Czechoslovakia withstood the "economic blizzard" with better than average success. But in 1932 and 1933 there was a marked slump in industrial production and the condition of agriculture became desperate. Foreign trade was lower than at any time in the republic's short history. There were successive budget deficits. The number of registered unemployed rose from an average of 102,200 in 1931 to an average of 184,500 in 1932 and to 224,400 in the month of August, 1933. The country's inability to meet foreign competition in foreign markets more successfully was attributed to relatively high prices, as compared with the other exporting countries. The high price level was attributed, in turn, to the government's fiscal policy, which tended to absorb available credit, maintain high interest rates, and intensify the effects of a diminished currency. Other causes of high prices were the tariff and exchange restrictions limiting imports, the exactions of cartels, and a badly organized distribution system.

During the parliamentary session from Mar. 14, 1933, to the end of July, the government secured comprehensive legislation designed to permit price reductions and to assist agriculture and other depressed occupations. One measure authorized the government to issue a 5 per cent employment loan to finance productive investment schemes and thus to relieve unemployment. The loan received an unexpectedly enthusiastic reception, subscriptions totaling 2,010,000,000 crowns. Another measure reduced interest on government and other securities from 6 to 5 per cent. Still others prohibited rent increases, eliminated harsh features of the farm foreclosure laws, and gave the government emergency economic powers for a period of five months. A decree of Aug. 14, 1933, effective immediately, authorized the creation of agrarian syndicates "to insure an appropriate utilization of agricultural products." The scheme envisaged the restriction of imports of vegetable or animal products when their competition proved harmful to Czechoslovak agriculture. A syndicate controlling the production, sale, and prices of forest products also was established.

STAND AGAINST TREATY REVISION. The stimulus to the agitation for revision of the peace treaties

given by the accession of Adolf Hitler to power in Germany aroused much concern in Czechoslovakia. That country owed its existence to the Treaties of Versailles, Saint Germain, and Trianon and it prepared vigorously to defend them. Foreign Minister Beneš played a leading part in welding the Little Entente states (Czechoslovakia, Rumania, and Yugoslavia) into a permanent, unified international organization in preparation for the expected struggle with the anti-treaty powers (see **LITTLE ENTENTE** for details).

The Foreign Minister outlined the government's policy before the Foreign Affairs Committee of Parliament on April 25. He admitted the possibility of minor revisions of the peace treaties, but insisted that they must be made under Article XIX of the League Covenant, i.e. by voluntary agreement with the states concerned. He vigorously opposed Premier Mussolini's plan for a four-power pact (see **ITALY** under *History*), until assured by France that the interests of the Little Entente would be duly safeguarded. Czechoslovakia joined with the other Little Entente states in signing a non-aggression pact with the Soviet Union on July 4, 1933. A closer understanding was reached with Poland and a rapprochement with Austria was inaugurated by Foreign Minister Beneš' visit to Chancellor Dollfuss in October. These moves were all inspired by Czechoslovakia's fear of German aggression, a fear which was aggravated by the German withdrawal from the Disarmament Conference and the League of Nations. Observers in Prague toward the end of 1933 reported that the Czechoslovaks were convinced that Germany was rearming and that when her preparations were complete she would precipitate a new European war. With little hope that the League or the world's peace machinery could avert the crisis, they were preparing for armed resistance and perfecting arrangements for coöperation with the armies of France, Poland, Rumania, and Yugoslavia.

THE FASCIST MENACE. The overthrow of democracy in Germany and Austria during 1933 left the democratic Czechoslovak republic surrounded by a ring of Fascist or semi-Fascist states. Fascist influences and propaganda swept across all its borders, winning many converts among the Czechs as well as among the German, Austrian, and Hungarian minorities. The government was forced to take vigorous action to defend itself from the Fascist assault. It played its hand with such skill and moderation as to retain the support of the minority parties and emerged victorious in the first phase of the conflict.

On May 8 the government acted to prevent the spread of Nazi propaganda by banning 334 foreign newspapers, mostly German and Austrian, from the Czechoslovak mails. In the northern frontier districts, it issued manifestoes warning the inhabitants against the cultivation of relations with the German Nazis. The German National Socialist party in Czechoslovakia attempted in vain to form a solid front of all Germans in the republic against the Prague government. Except for the German Nationalists, the other German parties rejected the proposal. They enjoyed extensive minority privileges in Czechoslovakia and for years had shared in the government. Opposed in principle to *Fascism* and *Hitlerism*, they joined with the Czechs deputies in Parliament

in passing legislation which banned all Fascist groups regardless of their nationality and imposed drastic penalties upon civil servants who spread Fascist propaganda.

The Czech Fascist movement suffered a severe blow when a court martial at Brno on June 26 sentenced 58 defendants to prison for terms of six months to six years for participating in the Fascist revolt of 1932 (see 1932 **YEAR BOOK**). The German Fascist party announced its own dissolution on October 4, a few hours before a government order banning it and the German National party, with which it was about to amalgamate. Three of the party leaders were arrested. Nation-wide raids on Fascist centres and homes followed, accompanied by numerous arrests and the confiscation of propagandist material. When Parliament reassembled October 17, the government gave notice that it was prepared "to defend democracy to the utmost" and to take even more drastic steps if necessary. Vacant seats of the German Nazi party were redistributed among the coöperating German parties.

THE SLOVAK AGITATION. The government also took action to check the agitation for greater autonomy which had been carried on for some years among the Slovaks, as well as the Hungarian Irredentist movement. On September 25, gendarmes broke up an autonomist demonstration at Tyrnau by the Slovakian People's party, led by Father Andrej Hlinka. The Slovaks' chief demand was for the replacement of Czechs by Slovaks in the public administration of Slovakia.

OTHER EVENTS. Following the British example, Czechoslovakia made "token payments" on her war debt to the United States government on June 15 and Dec. 15, 1933. On June 15 she paid \$180,000 instead of the \$1,500,000 due and on December 15, \$150,000 on an installment of \$1,682,813. In September the Cabinet at a special meeting decided to formally protest against a letter allegedly written by the Papal Nuncio Ciriaci to Father Hlinka, which had created a furore when published in a Nationalist newspaper. The letter complained that the Nuncio had been subjected to insults and criticized Prague as a place of residence. The Cabinet demanded that the Nuncio be recalled to Rome to explain his action to his superiors.

See **REPARATIONS AND WAR DEBTS**; **LITTLE ENTENTE**; **GERMANY, AUSTRIA, and FRANCE**, under *History*. Consult Robert Machray, "The Nazi Threat to Eastern Europe," *Current History*, December, 1933.

DAHOMÉY, dā-hō'mā. A French colony between Nigeria and Togoland, on the west coast of Africa, a subdivision of French Africa (q.v.) Lieutenant-Governor in 1933, M. Blacher.

DAIRYING. The dairy industry suffered more seriously in 1933 than in 1932 from a curtailed foreign and domestic demand, reduced consumption, and low prices of dairy products which were aggravated by an increased production.

The number of milk cows and heifers two years old and over on farms in the United States reached an all-time record in January, 1933, of 23,136,000, as estimated by the United States Bureau of Agricultural Economics. This number increased about 3 per cent during 1933. The number of calves and heifers kept on farms for future milk production also approached an all-time record. The prevalence of a prolonged drought in several production areas, particularly

the South, limited feed and forage so that milk production per cow decreased about 2 per cent. However, with the increase in the number of milk cows, total milk production in the United States increased about 3 per cent. The changes in the production were considerably influenced by lighter feeding throughout the year although average production was reported heavier during August and September. Fall pastures were relatively good in most sections.

An unusually heavy production of butter was noted in the fluid milk areas, particularly in New York State, toward the close of the year. This increase, an indication of excessive fluid milk surpluses, had a tendency to lower butter prices.

It was very difficult to estimate the production of the various manufactured dairy products during the year because of the changes in the production programmes of different dairy plants on account of the uncertain market conditions. Butter production in 1933 was estimated at about $2\frac{1}{2}$ per cent greater than in 1932, and cheese production about 3 per cent larger. While condensed milk showed a decrease, the manufacture of evaporated milk, by far the most important of these products from the standpoint of the milk used, increased more than 10 per cent. The total milk equivalent employed in the manufacture of dairy products was estimated to have increased nearly 4 per cent as compared with 1932.

As a result of these conditions, coupled with a small foreign demand and reduced consumption at home, cold storage stocks of both butter and cheese reached unprecedented high levels. On September 1 and October 1 there were about 175,000,000 pounds of butter in storage, in comparison with 107,000,000 pounds on Sept. 1, 1932, and 89,000,000 pounds on Oct. 1, 1932. More than 90,000,000 pounds of cheese were reported in storage at the same time in 1933. In terms of milk equivalent, the stocks of butter and cheese in cold storage and condensed and evaporated milk in manufacturers' hands were 76 per cent greater on Nov. 1, 1933, than at the corresponding date of 1932. An agreement reached on Oct. 20, 1933, between the Agricultural Adjustment Administration and the Dairy Marketing Corporation (representing producers, processors, and distributors) to purchase surplus dairy products in coöperation with the Secretary of Agriculture, was an important factor in helping to lower the excessive stocks of butter and cheese. In the fall of 1933 the government purchased about 61,000,000 pounds of butter and 4,500,000 pounds of cheese under this plan. The Federal Surplus Relief Corporation was to distribute the products to the unemployed. On December 1 stocks of butter were only 7,000,000 pounds in excess of the 5-year average for that date. The butter industry also organized a campaign to stimulate consumption by educating the people of the home and community in both rural and consuming centres as to the nourishing properties of butter and its special merits and desirability as a food product.

On account of the dissatisfaction of producers on prices received for milk, a farm strike movement gained considerable headway in October in the Central West. It materially affected deliveries of milk for cheese manufacture and resulted in the closing of the factories in large sections of Wisconsin where the movement was particularly vigorous.

To assist in curtailing production of dairy products, the United States Bureau of Dairy Industry recommended more rigid culling of the poor cows from the herds, thus reducing feed costs and increasing profits.

INTERNATIONAL CONDITIONS. The foreign trade of the United States, which has been falling off in total volume year by year, continued the decline in 1933, month by month, with few exceptions. Exports in particular were near the vanishing point, evaporated milk being the dairy product of which the largest quantities were exported. Butter prices in domestic and foreign markets reached so near the same level that exportation of some of the record supplies on hand in the United States might be possible were it not for existing foreign exchange rates, numerous foreign tariffs, and trade restrictions.

There were also heavy stocks of butter in storage in Great Britain and Canada which, on September 1, were 53,957,000 pounds in the former and 41,490,000 pounds in the latter country. There were very heavy withdrawals from storage in Great Britain in the early fall, and in December storage stocks fell below 1932. Butter shipments from Australia, New Zealand, and Argentina during the late summer and fall of 1933, were below the high levels reported for late 1932 shipments, but heavy production was reported in the late fall.

An increased consumption of butter in Great Britain and Germany caused, particularly during the latter part of the year, a reduced consumption of margarine. In the first nine months of 1933 the apparent consumption of butter in the United Kingdom was 734,791,000 pounds as compared with 661,637,000 pounds in the corresponding period of 1932. The Empire Marketing Board reported that per capita butter consumption in the United Kingdom increased from 14.8 to 20.7 pounds from 1924 to 1931. Apparently this trend continued in 1933, and was favored by cheaper butter prices and lowered margarine production and importations.

Under fat control measures promulgated in Germany by the German Reich, margarine was heavily taxed to bring about a reduction in the production of margarine (from imported materials) and an increased use of domestically-produced butter and other fats. The scheme was apparently successful as margarine sales were lowered from 30 to 35 per cent, and butter sales increased about 15 per cent.

A sharp reduction in ocean freight rates announced in July provided a cost of 0.7 cents per pound for refrigerated shipments of butter from Denmark to New York, and about 1.5 cents for shipments from New Zealand to New York, taking account of differences in exchange rates. The last is about the same as the cost of shipping butter from Minneapolis to New York.

Critical situations in the European countries were met in various ways. In Germany a tariff of about 8 cents per pound was placed on butter, and quota restrictions were set up. Great Britain also had a tariff of about 3 cents per pound on all but Empire butter. Depreciated currencies gave New Zealand, Denmark, and Australia a decided advantage in these markets and practically prohibited United States butter.

Butter production was reduced in Denmark, but not as heavily as exports, and prices declined. Attempts were made to meet the situation by slaughtering large numbers of cows for use in

the manufacture of meat meal (see LIVESOCK). The Netherlands required that margarine consumed domestically contain 40 per cent butter. Other countries attempted to meet the situations by similar methods.

The bulk of the foreign trade of the United States in dairy products was mainly limited to exports of concentrated milk and imports of foreign types of cheese, principally from Italy and Switzerland.

RESEARCH. Investigational work in the United States and other countries continued along previously established lines. In the attempt to reduce production costs and emphasize work which might have application to the solution of problems which arose as a result of the depression, more attention was given to the possibilities for greater utilization of pastures and forage crops, cheaper feeds, and greater amounts of roughage in the ration.

The Massachusetts Agricultural Experiment Station completed a three-and-one-half years' study on the influence of high-roughage low-grain rations as compared with low-roughage high-grain rations on milk production. The results of this investigation showed that the cows receiving the larger amounts of grain maintained milk production better than those in the high-roughage group, and reproduction was better. The high-roughage ration, however, involved a considerably smaller cash outlay. The digestibility of dried pasture herbage was studied by the Washington Agricultural Experiment Station, in cooperation with the United States Department of Agriculture, to furnish basic information on the feeding value of common pasture grasses. Artificially dried young grass was found at the Vermont Agricultural Experiment Station to closely resemble a good dairy ration. Excellent results were obtained when ten pounds of this grass was fed with hay and silage without grain, and average milk production was obtained. The improvement of pastures by fertilization was studied at many of the experiment stations in the dairy producing sections of the United States. The carrying capacity of pastures was improved by the application of fertilizers in studies in New Zealand so that 20 more cow days of pasture were obtained per acre. The vitamin content of pasture grasses was investigated at the Idaho Agricultural Experiment Station. All of these studies, and many others with pastures, not only indicated the relatively low cost of pasture feeding, but also showed that pasture grasses have a high nutritive value.

Roughages were studied from many points of view, but of special interest was the qualitative studies of them. Sorghum was found by the Texas Agricultural Experiment Station to contain vitamin A, although in insufficient quantities to supply adequate amounts of the vitamin to producing dairy cows when no other source of this vitamin was supplied in the ration.

With the increased public recognition of the importance of vitamins in human nutrition, studies were conducted on possibilities of modifying the amounts of vitamins A and D in the milk of dairy cows by changes in the ration. The vitamins A and D contents of the milk were increased by cod-liver oil and irradiated yeast feeding in experiments conducted at the Ohio Agricultural Experiment Station and at other institutions.

Much importance in infant feeding attended

the discovery several years ago, by the Utah Agricultural Experimental Station, of an important relation between the softness of curd in milk and its digestibility. Although soft-curd milk was superior to hard-curd milk for infant feeding, hard-curd milk was found last year to be preferable to soft-curd milk for cheese making as it not only gave a better yield, but a higher quality product was produced from it.

Much investigational work was related directly to improvements in the technical phases of dairy manufacturing, which increased the assurance of purity and freedom from disease transmission and facilitated the more certain and economical production of a high quality product. *Acidophilus* milk is objectionable and unpalatable to certain individuals for whom it is recommended. The Washington Agricultural Experiment Station found that some of the strains could be incorporated in sherbets without destroying their viability, thus providing the beneficial organism in a more palatable form.

An interesting indication of the frequent widespread application of the fundamentals of dairy research was the adoption by the Japanese government of the well-known Breed direct microscopic count method for the sanitary control of dairy products. This method was developed at the New York State Agricultural Experiment Station several years ago.

NECROLOGY. Clarence H. Eckles, professor of dairy husbandry at the University of Minnesota, and one of the best known scientific authorities on dairy cattle feeding in the country, died on Feb. 13, 1933. Professor Eckles had studied at the University of Wisconsin, Göttingen University, and the University of Bern, and in addition to the position occupied at the time of his death, held important positions at Iowa State College and Missouri University earlier in life.

The death of Dr. Charles L. Beach occurred on Sept. 15, 1933. He was professor of dairy husbandry at the University of Vermont from 1896 to 1908, after which time he was president of the Connecticut Agricultural College. R. C. Munkwitz, professor of dairy manufacturing at the University of Maryland, died on Jan. 6, 1933. He was succeeded by Dr. Charles W. England.

Arthur J. McGuire, manager of Land O'Lakes Creameries, Inc., and which was made up of about 400 creameries in and around Minnesota, died in October, 1933.

DALAI LAMA OF TIBET, THE. See NGAG-WANG LOBSANG THUBDEN GYA-TSHO.

DALE, PORTER HINMAN. An American lawyer and legislator, died at Newark, Vt., Oct. 6, 1933. Born at Island Pond, Vt., Mar. 1, 1867, he received his education in private schools in Philadelphia and Boston and then acted for two years as principal of the Green Mountain Seminary at Waterbury, Vt. On deciding on a legal career he studied law with his father, George N. Dale, and was admitted to the Vermont bar in 1896. After 1900 he practiced in the United States courts. He was also president of the Island Pond National Bank, the Island Pond Electric Co., the Fitzgerald Law and Lumber Co., and the Fitzgerald Paper Co. and from 1897 to 1910 served as chief deputy collector of customs at Island Pond. At the Republican State Conventions of 1898 and 1920 he was appointed chairman. He was also a member of the Vermont Senate for the terms 1911-13 and 1913-15 and represented the second Vermont district in the national House of Representatives during 1915-23. Elected to the United States Senate in 1923 to fill the unexpired term of William P. Dillingham, he was reelected in 1926 and again in 1932.

Senator Dale was a member of the committees on civil service, pensions, and public lands. His stand, however, in voting for the soldiers' bonus and the postal employees' pay increase after President Coolidge's veto not only caused resentment among certain of his constituency, who felt that he should have been more loyal in his support of a Vermont-born President, but resulted in his receiving no Federal patronage in Vermont.

DALMATIA. A former crownland of Austria now incorporated in Yugoslavia (q.v.).

DAMS. Dam construction during 1933 has gone forward at a remarkable pace and apparently without being seriously affected by depression conditions. Such works, of course, usually involve several years for construction and many of them have been under way for some time. Nevertheless, there has been a surprising number of new projects initiated in the depression years.

BOULDER DAM. With the change in administration the name Hoover has been dropped and this great work is now generally referred to by its original designation—Boulder Dam. At the beginning of the third year of construction this colossal undertaking was two years ahead of schedule. This is probably to be accounted for by the fact that the unprecedented size of the undertaking led to adopting a conservative progress estimate, and that conditions at the site have been more favorable than could have safely been anticipated.

The first stage of the construction was completed in November, 1932 when the river was bypassed around the site, by means of a temporary cofferdam, which caused the flow to pass through

the four huge diversion tunnels in the side walls of the canyon.

The final cleaning up of the river bed for the dam foundation was rapidly accomplished and confirmed the predictions by the consulting geologists of a bed rock of excellent character to support the huge structure. Concreting began in June and by December 12 over 1,000,000 cubic yards had been placed, bringing the dam up to 162 ft. of its total height of 729 ft. Many features of this concrete work are of interest.

Unusual precautions are being taken to secure a solid, monolithic concrete mass in the dam. It is a well known fact that the chemical reactions, which take place in cement during setting, generate very considerable heat. Upon subsequent cooling, shrinkage occurs. Accordingly the Reclamation engineers responsible for this record breaking structure specified a "low heat" cement. This is not as strong as the standard product but is claimed to be more durable due to its decreased tri-calcium-aluminate content. Furthermore, as it may take years for the concrete in this massive structure to cool, it is placed in vertical prisms each of which is surrounded by cooling pipes. Some 300 miles of one-inch pipe will be used, through which cold water is constantly circulated while the temperature is checked by thermometers placed throughout the dam. The shrinkage gaps between each prism are pressure grouted when the proper temperature is attained.

It was at first proposed to use a concrete mixed with sufficient water to give what is known as a 1 to 1½ inch "slump." Experience showed that such a dry concrete cannot be properly placed in the 8 cu. yd. units employed. Accordingly a wetter, 2½ to 3 inch slump, concrete is being used. As the *Engineering News-Record* remarks, "If the gain in strength, durability and impermeability of a drier mix are weighed against the increased harshness, cost of placement, and tendency to non-uniformity in compaction due to decreased plasticity, the disadvantages will be found to outweigh the advantages."

The gravel and concrete plants for this work are themselves huge constructions meriting detailed description. Much attention has been given to them in the engineering-contracting periodicals and we should remember that the construction of a work of this magnitude is made possible not alone by advances in the theory of dam design, but primarily by progress in the art of construction. This is reflected in all phases of this undertaking but particularly in the remarkable progress on the diversion tunnels (see 1932 YEAR BOOK), in the gravel and concrete plants, in the huge cableways used in placing the concrete, and in the fact that the colossal steel pipes for the penstocks are being fabricated at the site.

The largest of these pipes are 30 ft. in diameter and 2¾ inches thick—far larger and heavier than any pipe ever built. Transportation difficulties made it necessary to do the fabrication at the site. Flat steel plates, shipped from eastern steel plants, are planned, bent into cylindrical form, welded together to form pipe; the joints are inspected by X-rays, and finally the sections are annealed at 1200° F. in a special furnace, the largest of its kind, to relieve fabrication stresses. Practically all of the smaller pipe, 8½ and 13 ft. in diameter, has been completed. A special 150-ton cableway, five times the capacity of any previously built, has been completed to handle the installation of these great tubes,

As the year closes the spillway construction is practically completed and excavation is going rapidly forward on the smaller penstock tunnels. With the rapid progress on the dam proper it would appear that this great work would be completed before the All-American Canal (see RECLAMATION) and other facilities for using its water and power are ready.

PINE CANYON DAM. Among the smaller gravity-masonry dam structures this 245 ft. work in the San Gabriel Canyon, by means of which the Pasadena water supply will be augmented, is of special interest. Due to a longitudinal fault at the dam site and to the possibility of seismic disturbances, this dam is being constructed with a special keyway over the fault and is designed to resist earthquake shock.

EARTH AND ROCK FILL DAMS. In many cases where foundation conditions are not suited to gravity structures, earth or rock fill dams are being constructed. This is particularly true on the West Coast where the recent volcanic rocks are frequently badly shattered or uncompacted and where moderate earthquake shocks are of common occurrence. The El Capitan Dam on the San Diego River is a hydraulic fill structure 220 feet high with heavy rock facing. The Bouquet Canyon Dams for Los Angeles, built to regulate the flow of the Owens River, are also earth embankments but of the rolled-fill type. The Cle Elum Dam on the Yakima River, a United States Bureau of Reclamation project, is also an earth structure. The San Gabriel Dams, No. 1 and No. 2, now under construction for flood control and water conservation (irrigation) are both rock-fills. The Middle Rio Grande Conservancy District is constructing a metal faced, gravel fill dam in New Mexico. Indeed, the activity in this type of dam construction extends to the East where, in fact, several record structures such as the Dix River, the Cobble Mountain, the Saluda and the Davis Bridge Dams, already exist. Baltimore, for example, has increased its water supply by means of the Pretty Boy Dam on the upper Gun Powder River, 29 miles from the city. This is 147 feet high with a core wall extending part way through the structure.

The interesting and difficult core wall problem (see FOUNDATIONS) encountered in connection with the Quabbin Reservoir for the Boston Metropolitan System, has also emphasized the growing importance of the earth fill type of dam.

Bibliography. A series of articles on the compaction of earth fills by R. R. Proctor in the *Engineering News-Record* of August and September is a particularly valuable contribution in this field. The results of this study are being applied in connection with the Bouquet Dams for Los Angeles noted above.

MOVABLE DAMS. The advantages of the various forms of movable dams have frequently been lost sight of by engineers in general practice due to the fact that their construction has been confined largely to river canalization—a type of work carried on only by the U. S. Corps of Engineers. Several smaller but interesting structures of this form have been under way or proposed during the year. Army engineers have built a small A-frame type of dam to provide an increased depth of waterway on the Cumberland River near Nashville. In the past this type has given trouble due to its tendency to collect gravel and silt. It is expected that improvements in this particular design will obviate this difficulty. In the govern-

ment project to provide a 9-foot channel from St. Louis to St. Paul, Army engineers have also been building a roller gate dam known as Dam No. 15 at Rock Island, Ill., on the Mississippi. A similar type of dam has also been proposed by Army engineers for the Kanawha River in West Virginia.

TENNESSEE AUTHORITY. In connection with the much discussed Muscle Shoals or Wilson Dam and the work of the recently constituted Tennessee Valley Authority, work is under way on the Norris Dam at Cove Creek on the Clinch River near Knoxville, Tenn. This site had previously been examined by U. S. Army engineers in connection with navigation proposals. Due to bad caves in the limestone rock, the original height of 250 feet has been reduced by 14 feet and the dam is being built by the Authority but designed by the Denver Office of the U. S. Bureau of Reclamation. Existing dams in this area are largely for "run-of-river" plants and the Authority proposes to build dams of the reservoir type so as to increase the available power in times of low river flow.

COLUMBIA RIVER. Bids were opened on November 20th for a \$63,000,000 work on the Grand Coulee site on the Columbia River. It is said that this dam is the key to the Columbia Basin development. The final plan calls for a dam 370 feet high for power and irrigation. It is planned to use part of the power developed to pump water into a storage basin formed in the coulee, or ancient river channel. The present project is for a 145-foot structure which can later be increased in height.

On September 29th the P.W.A. approved another project on the Columbia River, that for a dam at Bonneville, Ore. This is to be a combination power and navigation work.

CENTRAL VALLEY CONSERVATION PROJECT. This undertaking, designed to develop the Central Valley area of California, involves two dam constructions—the Kennet and the Friant—which may be undertaken with P.W.A. assistance.

OTHER AMERICAN WORKS. Among the other American constructions, we note that work on the Rodriguez Dam near Tia Juana in Mexico, to be the record dam (250 feet) of the Ambursen type, has been resumed after 18 months shut down. Also the R.F.C. has made a loan to repair the Lake Pleasant Dam on the Aqua Fria River in Arizona. It will be recalled that this multiple arch structure, 170 feet high and completed in 1927, developed cracks and was lowered by 24 feet in 1929. Progress should also be noted on the Madden Dam on the Chagres River, Panama Canal Zone. (See 1932 YEAR BOOK.)

GEBEL AULIA. Bids for the construction of this reclamation structure on the White Nile about 30 miles south of Khartoum in Upper Egypt, were accepted late in the year.

FAILURES. Following two abnormally dry seasons with the reservoir drawn down to the lowest level ever reached, hydrostatic pressure under the upstream concrete facing of the Belle Fourche Dam, on the reclamation project of this name in South Dakota, caused an extensive slide on August 2nd. Repairs were immediately undertaken.

The failure of the combination rock fill and masonry Castlewood Dam in Colorado was, unfortunately, more serious than the partial failure at Belle Fourche. The dam, criticized by many engineers, is on Cherry Creek, 35 miles from

Denver. The entire east half of the structure, including the spillway, was washed out following a cloud-burst. Two lives were lost and much damage done in Denver.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANUBIAN UNION. See UNITED STATES OF EUROPE; ITALY under *History*; LITTLE ENTENTE.

DANZIG, dän'tsik, FREE CITY OF. A port and territory on the Gulf of Danzig, Baltic Sea, established as a free city on Nov. 9, 1920 by articles 100 and 102 of the Treaty of Versailles. It was formerly a part of the German Empire. The port occupies a strategic position at the mouth of the Vistula River. Total area, 754 square miles; total population (August, 1929), was 407,517, of whom 235,237 were in the city proper. The population was 95 per cent German and less than 5 per cent Polish in 1929. German is the official language. In 1929, there were 44,632 students in elementary schools, 3228 in middle schools, and 6207 in high schools. In the winter term of 1931-32 the Technical University had 1826 students.

Danzig is well situated with relation to the great Polish, Russian, and German grain districts and has been the chief outlet for the commerce of Poland, which exercises joint control with the Free City of the harbor administration. The territory is also within the Polish Customs administration. Traffic through the port in 1933 amounted to 6,207,733 metric tons. The prosperity of Danzig was adversely affected by the new Polish port of Gdynia (see POLAND under *Communications*).

In 1932 shipping aggregating 2,750,000 net registered tons entered, and 2,920,000 net registered tons left the port of Danzig. The ordinary budget for 1932 was estimated to balance at 78,637,530 gulden. Four main railway lines connect Danzig with important German cities, while three other main lines run to Polish cities. Air lines link the port with various German and Polish points.

Danzig is under the protection of the League of Nations, which appoints a High Commissioner to settle disputes between the Free City and Poland. Foreign relations are controlled by Poland, but the Free City exercises a veto power. The Constitution, as approved by the League of Nations on May 11, 1922, vests executive power in the President of the Senate, which is the highest state authority. A Diet of 72 members elected for four years by universal suffrage elects the members of the Senate and its President. The composition of the Diet elected on May 28, 1933, was: National Socialists, 38; Socialists, 13; Centrists, 10; Communists, 5; Nationalists, 4; Polish, 2. The National Socialists (Hitlerites) polled 108,000 of the total 215,000 votes recorded. H. Rauschning (National Socialist leader) was elected President of the Senate on June 20, 1933. On Oct. 26, 1933 Sean Lester of the Irish Free State was appointed by the League of Nations to succeed H. R. G. Rosting as High Commissioner. See GERMANY and POLAND under *History*.

DARTMOUTH COLLEGE. A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1933 autumn session had an enrollment of 2422 students, most of whom were working for the B.A. degree, the exceptions being 15 graduate students, 41 students in the medical school, 18 in the Thayer

School of Civil Engineering, and 87 in the Tuck School of Administration and Finance. There were 270 members on the faculty. The endowment amounted to \$18,650,000, while the income for the year was \$592,000. The Fisher Ames Baker Memorial Library contained 370,678 volumes. President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

DAVIS, ARTHUR POWELL. An American civil engineer, died in Oakland, Calif., Aug. 7, 1933. He was born at Decatur, Ill., Feb. 9, 1861, and was graduated from the State Normal School at Emporia, Kans., in 1882 and from Columbian (later George Washington) University in 1888. Until 1894 he was associated with the United States Geological Survey as topographer in charge of surveying expeditions in Arizona, New Mexico, and California. He then became hydrographer in charge of stream measurements and the selection and surveying of reservoir sites for the Irrigation Survey, and from 1898 to 1901 conducted hydrographic examinations of the Nicaragua and Panama canal routes. His long connection with the United States Reclamation Service dated from the enactment of the Reclamation Law in 1902, when he was appointed principal assistant engineer in charge of surveys and construction. In 1907 he became chief engineer for the Service, serving the next year as consulting engineer on the construction of the Panama Canal. He was also commissioned by the Russian government to conduct an irrigation investigation in Turkestan in 1911, and in 1914 was a member of the board of engineers sent by the American Red Cross to investigate flood control and irrigation problems in China.

Appointed director of the United States Reclamation Service in 1914, Mr. Davis directed some of the most important dam construction for irrigation purposes in the United States, including the Arrowrock in Idaho, the Shoshone and Pathfinder in Wyoming, the Elephant Butte in New Mexico, and the Roosevelt Dam in Arizona. During his entire service he built more than 90 dams, hundreds of tunnels including the great Gunnison Tunnel in Utah, and 15,000 miles of canals, bringing the total area of existing irrigation enterprises, according to the Census of 1920, to 35,890,811 acres. On his retirement in 1923 he became chief engineer and general manager of the East Bay Municipal Utility District, having charge of the development of the Hetch Hetchy Water Supply System, planned to deliver water from the Mokelumne River through a 94-mile conduit to cities on the eastern shore of San Francisco Bay. In 1929 he went to the U.S.S.R. as chief consulting engineer for examining and reporting upon irrigation projects in Turkestan and Transcaucasia and directed the building of a hydroelectric system for the Soviet government.

Previous to his death Mr. Davis was named by the Bureau of Reclamation consulting engineer on the construction of Boulder Dam, whose possibilities he had envisaged 13 years previously when he had been directed by Congress through the Kinkaid Act to report on the improvement of the Colorado River basin with special attention to the impounding of water for irrigation purposes and adequate flood control for the Imperial Valley. In 1920 he was president of the American Society of Civil Engineers and in 1922 and 1924 Lyman lecturer on hydraulics at the Sheffield Scientific School of Yale University. He

published *Elevation and Stadia Tables* (1893); *Progress of Stream Measurements* (1897); *Irrigation near Phoenix, Arizona* (1897); *Hydrography of the American Isithmus* (1902); *Water Storage on Salt River, Arizona* (1903); *Irrigation Works Constructed by the United States Government* (1917); and *Irrigation Engineering* (1918).

DAVIS, CHARLES H (AROLD). An American landscape painter, died at Mystic, Conn., Aug. 5, 1933. He was born at Amesbury, Mass., Jan. 7, 1856, and studied with Otto Grundmann at the Boston Museum School and afterward under Boulanger and Lefèvre at the Académie Julian in Paris. On his return to the United States in 1890 he took up his residence at Mystic, and in 1901 was elected an associate of the National Academy of Design and in 1906 an academician. Among the other honors bestowed on him were the Palmer prize of the Chicago Art Institute in 1890, the Lippincott prize of the Pennsylvania Academy of Fine Arts in 1901 and the Sesnan gold medal in 1919, the Altman prize of the National Academy of Design in 1917 and the Saltus medal in 1921, and the second W. A. Clark prize and Corcoran silver medal of the Corcoran Gallery, Washington, in 1919; also medals at the Chicago, Atlanta, Paris, Buffalo, St. Louis, and San Francisco expositions.

Davis's early landscapes were chiefly evening effects, often of a sombre nature but characterized by direct vision and simple workmanship. Among the more notable were: "Evening" and "August" (Metropolitan Museum of Art, New York City); "The Deepening Shadows" (Corcoran Gallery, Washington); "Close of Day" and "Twilight" (Art Institute, Chicago); "Moonrise at Twilight" (Carnegie Institute, Pittsburgh); and "At Sunset" (Art Museum, Worcester, Mass.). His later work showed a tendency to interpret nature in her more cheerful moods, with a spirit of light and joy predominating. This was especially seen in "Summer" (National Gallery, Washington); "Clouds" (Museum of Fine Arts, Boston); "Early Summer" (Institute of Art, Minneapolis); "Clouds and Hills" (City Art Museum, St. Louis); and "The Time of the Red Winged Blackbird" (Museum of Art, Syracuse, N. Y.).

DAVIS, STEPHEN BROOKS. An American lawyer, died in New York City, Feb. 24, 1933. He was born at Middletown, Conn., Nov. 18, 1874, and was graduated from Wesleyan University in 1895 and with the LL.B. degree from Yale in 1897. Admitted to the New Mexico bar in 1898, he practiced at Las Vegas for several years. In 1903 he was appointed district attorney for the Fourth District of the Territory, in 1908 the Territory's Assistant United States Attorney, and in 1912 upon the admission of New Mexico to the Union the State's first United States Attorney, holding the latter office for two years. He also served during 1921-22 as associate justice of the Supreme Court of New Mexico. In 1923 he was appointed Solicitor of the United States Department of Commerce, and in that capacity helped solve the question of the supervision and control of radio broadcasting through framing the law that led to the creation of the Federal Radio Commission.

Mr. Davis was also vice-chairman of the International Radiotelegraph Conference held in Washington in 1927, counsel for the United States on the St. Lawrence Waterways Commis-

sion, Federal representative on the North Platte River Commission, and New Mexico's representative on the Colorado River Commission. In 1927 he retired to private practice in New York City. His book, *The Law of Radio Communication* (1927), received the Linthicum Foundation prize from the law school of Northwestern University.

DE ANGELIS, JEFFERSON. An American actor, died at Orange, N. J., Mar. 20, 1933. Born at San Francisco, Calif., Nov. 30, 1859, he received a public school education in San Francisco, Philadelphia, and New York City and at the age of 10 made his début in a vaudeville act at the Odeon Theatre in Baltimore. His repertoire during the next ten years consisted of dancing, singing, clowning, tumbling, and melodramatic bits in the performances which his father, mother, and sister staged on their tours of the newly-settled West. In 1880 he formed his own company, with which he toured Australia, China, Japan, Burma, India, and South Africa, presenting during the next four years such favorites as *Uncle Tom's Cabin*, *One Word*, and the Gilbert and Sullivan operettas.

On his return to the United States in 1887 Mr. De Angelis joined the McCaull Opera Co., singing in about ten light operas. From 1891 to 1895 he was leading comedian at the Casino Theatre, New York City, appearing in *Apollo*, *The Grand Duchess*, *Indigo*, *The Tyrolean*, *Uncle Celestin*, *The Child of Fortune*, *The Vice-Admiral*, *The Passing Show*, and *The Little Troupier*. He considered that his ultimate ambition was achieved when in 1897 he appeared with Lillian Russell in *The Wedding Day*, destined for a two-year run at the Casino. His greatest success, however, was in *Fantana*, with which he toured under his own management in 1904 and 1906 and appeared at the Lyric Theatre, New York in 1905.

Mr. De Angelis later appeared in *The Great White Way* (1907), *The Beauty Spot* (1909), *The Mikado* (1910), *The Pearl Maiden* (1912), *Rob Roy* (1913), *The Passing Show of 1917* (1917-18), *The Merry Widow* (1921), *The School for Scandal* (1925), *Revelry* (1927), *The Royal Family* (1927), and *Apron Strings* (1930). The story of his career was told in *The Vagabond Troupier* (1932), of which he was co-author with Alvin F. Harlow.

DEATH RATE. See VITAL STATISTICS.

DEBTS, PUBLIC. See PUBLIC FINANCE; GREAT BRITAIN, FRANCE, GERMANY, ETC.

DEFICIT. See UNITED STATES under *The Treasury*.

DELAWARE. POPULATION. The population of the State on Apr. 1, 1930, according to the Fifteenth Census, was 238,380; in 1920 it was 223,003; in 1933 (Federal estimate), 241,000. Wilmington, the chief city, had (1930) 106,597 inhabitants; Dover, the capital, 4800.

AGRICULTURE. The following table shows the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1933	145,000	3,625,000	\$1,776,000
	1932	147,000	4,263,000	1,194,000
Wheat	1933	77,000	1,078,000	927,000
	1932	79,000	908,000	481,000
Hay (tame)	1933	73,000	122,000*	1,305,000
	1932	73,000	114,000*	1,060,000
Sweet potatoes	1933	7,000	910,000	410,000
	1932	7,000	805,000	282,000

*Tons.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments, \$7,306,371 (of which \$2,366,100 was for local education); for interest on debt, \$166,339; for permanent improvements, \$6,442,253; total, \$13,913,963 (of which \$3,340,513 was for highways, \$32,163 being for maintenance and \$3,015,350 for construction). Revenues were \$12,471,532. Of these, property and special taxes furnished 61.3 per cent; departmental earnings and compensation to the State for officers' services, 5.4; sale of licenses, 20.4 (in which was included a gasoline sale tax that produced \$1,099,054). Funded debt outstanding on June 30, 1932, totaled \$3,215,500, of which \$2,905,000 was for highways. Net of sinking-fund assets, the debt was \$2,071,264. The State levied in the year no general ad-valorem tax on property.

EDUCATION. All salaries in the public-school system were reduced by legislative enactment, from the levels of the academic year 1931-32: those running from \$1000 to \$1500, by 5 per cent; above this and to \$3000, by 10 per cent; above \$3000 and to \$5000, by 15 per cent; and above \$5000, by 20 per cent. The school fund, however, was sufficiently ample to render it possible to carry on instruction in the public schools through 1933 with comparatively few curtailments of service. The allowance of 1 per cent of the State's school budget for the education of adults was continued. Many graduates of the high schools, according to report in the *Journal* of the National Education Association, returned to these schools to take additional work.

The number of persons of school age in the State, according to an estimate for 1932, was 53,000. There were enrolled in the public schools, in 1933, 44,074 pupils. Of these, 28,900 were in common schools or elementary grades; in high schools (junior and senior), 15,774. The expenditures of the year 1932-33 for public-school education totaled \$6,351,945. Salaries of teachers averaged, by the year, \$1542.

LEGISLATION. The Legislature met in regular session on January 3. It created a convention of 17 delegates at large, to be chosen by a special popular election and to act for the State on amendments to the Federal Constitution. There was created by statute a liquor commissioner empowered to buy and sell liquor somewhat after the manner of a State dispensary. Producers, importers, and hotels selling alcoholic drinks were placed under a system of licenses. In the banking panic of February and March power was given the banking commissioner to suspend payment of State banks' time deposits and to suspend, in any part, their payment of demand deposits; he was enabled to conduct the business of an embarrassed State bank without need of bringing action in court.

POLITICAL AND OTHER EVENTS. There were elected on May 27, by popular vote in the proportion of about 3½ to 1, 17 delegates at large, all favorable to the repeal of the Federal Eighteenth Amendment. They met in State convention on June 24 and voted the State's ratification of repeal by the superseding amendment proposed by Congress. Governor Buck declared a banking holiday on March 4, halting the operation of banks in the State. In the boundary suit of New Jersey against Delaware before the Federal Supreme Court, William L. Rawls, special master,

recommended to the Court on October 9 a determination of the boundary, in the estuary of the Delaware River, that would preserve Delaware's claim to territory as far as the low-water mark of the New Jersey shore within a radius of 12 miles from New Castle, but held that farther down the watercourse the boundary should follow the centre of the ship channel and not, as Delaware had contended, the geographical central line. The result was favorable to New Jersey, which sought to establish sovereignty over oyster beds.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, C. D. Buck; Lieutenant-Governor, Roy F. Corley; Treasurer, George S. Williams; Auditor, J. Henry Hazel; Secretary of State, Charles H. Grantland; Attorney General, Percy W. Green.

Judiciary. Chancellor, Josiah O. Wolcott; Chief Justice of Supreme Court, Daniel J. Layton; Associate Judges of Supreme Court, Richard S. Rodney, David J. Reinhardt, W. W. Harrington, Charles S. Richards.

DELAWARE, UNIVERSITY OF. An institution of higher learning in Newark, Del., founded in 1833. The enrollment in 1933-34 was 741, of whom 449 were men and 292 were women. The enrollment in the 1933 summer session was 456. The faculty numbered 125 members, 95 of whom were on the regular teaching staff, the others being members of the experiment station and extension staff. Appropriations from the State and Federal governments amounted to approximately \$445,330; invested endowment funds amounted to \$604,360. The library contained approximately 69,000 volumes. President, Walter Hüllihen, Ph.D., D.C.L., LL.D.

DEMERARA. A county of the colony of British Guiana, sometimes incorrectly used to designate the entire colony. See **BRITISH GUIANA**.

DE MOLAY, ORDER OF. A nonsectarian secret organization for young men between the ages of 16 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templars. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The order is governed by a grand council of Freemasons, while the chapters are sponsored by Masonic bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1933, the membership numbered 150,000. There were three chapters in the U. S. Navy, namely Battle Fleet, Admiral Dewey, and Asiatic, with membership confined solely to sailors. The official organ is *International De Molay Cordon* (monthly). Frank S. Land, the founder, is grand scribe; Dr. Stratton D. Brooks, former president of the Universities of Oklahoma and Missouri, is executive director. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

DENISON UNIVERSITY. A co-educational Baptist institution of higher education in Granville, O., founded in 1831. The enrollment for the autumn of 1933 was 713. The 1933 summer session had an attendance of 120. The faculty numbered 60. The endowment amounted to \$3,280,700, and the income for the year to \$280,800. There

were 75,000 volumes in the library. President, Avery Albert Shaw, A.M., D.D., D.C.L., LL.D.

DENMARK, KINGDOM OF. The smallest of the three Scandinavian countries; comprising the peninsula of Jutland, the two main islands Zealand and Funen, with about 200 smaller adjacent islands in the Baltic, the Faroe Islands and Greenland. The King of Denmark is also the King of Iceland (q.v.). Capital Copenhagen (København). King in 1933, Christian X.

AREA AND POPULATION. Denmark has an area of 16,576 square miles, excluding the Faroe Islands (area, 540 square miles) and Greenland (area ca. 827,000 square miles with a population of 16,000 Eskimos). Denmark had a population in 1932 estimated at 3,590,000, compared with 3,566,000 in 1931, 3,542,000 at the census of 1930, and 3,285,000 in 1921. For the five years 1928-1932, births averaged 65,776 annually and deaths 38,864; the birth rate per 1000 of the population averaged 18.4 and the death rate 11.08. Emigrants in 1932 numbered 768, compared with an average of 3856 annually for the five years 1928-32. The population of the leading cities in 1930 and 1925 was: Copenhagen (København), 771,168 (731,406 in 1925); Aarhus, 81,279 (76,226); Odense, 56,759 (52,376); Aalborg, 44,365 (42,819).

EDUCATION. Primary education is free and compulsory between the ages of 7 and 14. On Jan. 1, 1931, there were 497,430 pupils attending elementary schools and 51,468 attending secondary schools. The enrollment in all divisions of the University of Copenhagen averaged about 5000; in the University of Aarhus, about 200.

PRODUCTION. Danish economy is based chiefly upon agriculture and dairying, and farm products account for about three-fourths of the value of all exports. In 1931, 1932, and 1933 foreign markets for these exports were impaired by the general decline in purchasing power and the increase in tariffs, particularly by the Ottawa Agreements which curtailed the British market. About 66 per cent of the total area, or ca. 7,000,000 acres, was under cultivation. Livestock in 1932 included 3,237,400 cattle, 4,866,300 swine (compared with 4,384,000 in 1933), and 496,200 horses. In 1931 there were slaughtered 654,000 cattle and calves, and 50,000 sheep and goats. Production of butter (1932) was 415,000,000 pounds (430,000,000 pounds in 1931), of bacon 853,534,000 pounds (813,998,000 pounds in 1931). The chief crops in 1932 were: Wheat, 10,900,000 bushels; rye, 8,700,000 bushels; barley, 46,300,000 bushels; oats, 72,500,000 bushels; potatoes, 48,000,000 bushels, sugar beets, 1,433,000 metric tons; forage roots, 25,970,000 metric tons. The deep sea fisheries yielded 89,847 metric tons of fish to a value of 33,200,000 crowns (1 crown = \$0.268 at par). The turnover of Danish coöperative societies declined from 1,664,200,000 crowns in 1930 to 1,413,800,000 crowns in 1931.

Many of the world's motor ships are built in Danish yards; in 1932 motor ships comprised 16,000 tons out of 22,000 gross tons of shipping launched in Denmark. Food products, cigars and cigarettes, cotton yarn, cotton cloth, cement, bricks, paper, oils, and varnishes are other leading products. Of about 369,000 organized workers in 1932, an average of 99,500 were unemployed. In the first week of November, 1933, there were about 97,000 organized workers registered as unemployed, compared with 180,000 at the same time in 1932 and 63,000 in 1931.

COMMERCE. Due to lower prices and restricted markets, Danish foreign trade declined from 1929 through 1933. Imports in 1932 totaled 1,142,000,000 crowns (\$316,000,000 at par), against 1,465,000,000 crowns (\$392,600,000 at par) in 1931. Exports totaled 1,137,000,000 crowns (\$305,000,000 at par) compared with 1,333,000,000 crowns (\$357,244,000 at par) in 1931. Iron and steel, fabrics of vegetable fibre, mineral oils, coal, fertilizers, and automobiles were the chief imports in order of value in 1932, while pork, bacon, and butter were the principal exports. Germany in 1932 took 13.5 per cent of all exports (by value); Sweden and Norway, 6 per cent; and the United Kingdom 67 per cent. Germany furnished 26 per cent of the total imports by value; the United Kingdom, 22.3 per cent; United States, 7.7 per cent; and Norway and Sweden, 7.5 per cent. Denmark's statistics for 1932 showed exports to United States of 4,976,000 crowns (\$1,335,000 at par) (\$1,881,000 in 1931) and imports from United States of 87,630,000 crowns (\$23,500,000 at par) compared with 154,000,000 crowns (\$41,300,000 at par) in 1931. In 1933, imports were 1,264,789,000 crowns and exports 1,200,451,000 crowns, the import surplus being 64,338,000 crowns.

FINANCE. Budget operations for the fiscal year ended Mar. 31, 1933, ended with a surplus of 7,800,000 crowns as against an anticipated deficit of 900,000 crowns and a surplus of 88,000 crowns for the preceding year. The budget for the fiscal year 1933-34 as of Apr. 1, 1933, anticipated a deficit of about 45,000,000 crowns, but it was expected that this would be considerably reduced by additional revenues levied after that date. The budget estimate for 1933-34 placed revenues at 338,028,000 crowns and expenditures at 331,737,000 crowns. The total debt as of Mar. 31, 1933 was 1,255,488,000 crowns (\$336,470,000 at par), of which the internal debt comprised 564,823,000 crowns, and the external debt 690,665,000 crowns. Denmark abandoned the gold standard on September 28, 1931. The crown (Krone), par value \$0.208, exchanged at \$0.2676 in 1930, \$0.2506 in 1931, \$0.1883 in 1932, and \$0.2333 in the week of Dec. 5-10, 1933.

COMMUNICATIONS. Railroad lines in operation Mar. 31, 1932, extended 3280 miles, of which 1550 miles belonged to the state and 1730 to private companies. The government lines in 1932 reported gross receipts equivalent to \$28,600,000 at par and the private lines receipts equivalent to \$5,960,000 at par. A bridge for the state railroads spanning "Lille Bælt" connecting the mainland with the Baltic Sea island Fyn (Funen) was under construction in 1933. Work was also under way on the construction of the "Storestrøms Bridge," a bridge connecting the two islands Zealand and Falster, to speed up the traffic to the south. Highways extended about 32,060 miles. The addition of 25 new vessels to the Danish merchant marine during 1932 brought the total to 1,238,245 gross tons. Gross freight earnings, exclusive of coastwise shipping, were \$34,800,000 in 1932, compared with \$40,100,000 in 1931. A total of 39 vessels of 80,000 gross tons were idle on Oct. 1, 1933, compared with 106 vessels of 260,000 gross tons on Oct. 1, 1932. The only commercial airline in 1932 reported a flight distance of 160,357 miles, with a total of 4985 passengers, 49,000 pounds of freight, and 53,133 pounds of mail.

GOVERNMENT. The constitution as amended

Sept. 10, 1920, vests executive power in the King, who acts through a responsible cabinet. Legislative power is vested in the Rigsdag (Parliament), composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 149 members, of whom 117 are elected for four years on the basis of proportional representation; the Landsting has 75 members, 19 of whom are elected by the Landsting itself, the remainder being elected indirectly by voters over 35 years of age, for eight years. The composition of the Folketing after the election of Nov. 16, 1932, was: Social Democrats, 62; Liberals, 39; Conservatives, 27; Radicals, 14; Communists, 2; others, 5. After the election of Sept. 13, 1932, the Landsting had 28 Liberals, 27 Social Democrats, 13 Conservatives, 7 Radicals, and 1 Home Rule advocate from the Faroe Islands. Premier in 1933, Th. A. M. Stauning (Social Democrat), who was supported by a coalition of the Social Democratic and Radical parties.

HISTORY

ECONOMIC DEVELOPMENTS. Throughout 1933, Danish attention was concentrated chiefly upon the struggle to check the economic decline caused by the world depression and the almost universal prevalence of higher tariffs. The Social Democratic government intervened in the nation's economic affairs to an unprecedented extent in its effort to alleviate unemployment and agricultural distress. In January the Danish Employers' Association decided to lock out more than 100,000 workers who had refused to accept a 20 per cent wage reduction and longer hours. The government intervened and secured the passage by the Rigsdag on January 31 of a law making strikes and lock-outs illegal for one year. The government secured Opposition acquiescence in the anti-strike law by raising the official exchange rate of the pound sterling to 22.50 crowns from a previous level of 19.30 crowns. This resulted in a 10 per cent rise in the price of butter and eggs, benefiting the farmers, but caused the official index for wholesale prices to rise to 124 in February from 117 in January, largely through increases in the price of meat, textiles, clothing, and imported goods. The government had previously obtained an increase in bacon prices by forcibly curtailing shipments to Great Britain. Forced sales of farms were reduced by a moratorium on foreclosures.

Protected by the drastic restrictions on imports and by the low exchange value of the crown, the textile, tanning, clothing, footwear, glass, paper, and other industries producing for the domestic market were fairly prosperous. The export industries also showed some improvement over the preceding year.

The government's general economic programme, as announced early in the year, called for the speeding up of public works and building construction and the reduction of hours of labor to increase employment; placing part of the unemployed on small land holdings; distribution of 125,000,000 crowns worth of meat to the unemployed; a 75,000,000-crown public works programme to be financed from a national bank fund; assumption by the national government of part of the local governmental expenditures; and the reduction of bank interest rates to a maximum of 3 per cent for time and 3½ per cent for demand deposits.

Much of this programme was placed in effect

during the year. A new banking law passed in April established a crisis fund to insure greater liquidity of credit. The fund consisted of some 160,000,000 crowns of Treasury bills, to be discounted by the National Bank. Credit was to be advanced to agricultural credit institutions, banks, business enterprises, and other agencies whose liquidity had been impaired by the farm moratorium and other laws. The law also provided for the reduction in bank interest rates.

Another law, passed in May, completely reorganized the social services, effective Oct. 1, 1933. It grouped all such services under three main headings of workmen's compensation, general insurance and poor relief. Sickness, invalidity, and old-age insurance was provided for under the heading of general insurance and all persons between 21 and 60 years of age were required to insure under the sickness and invalidity funds. Annual expenditure under the bill was estimated at 203,979,000 crowns (\$54,673,322 at par), of which 82,040,000 crowns were to be supplied by the national government.

A series of measures known as "crisis bills" were introduced by the government when the Rigsdag reconvened in the middle of September. These measures provided further extensive relief to farmers, the unemployed, and low-income groups in general at the expense of the higher-income classes. One imposed a 10 per cent tax in addition to the normal income tax on income derived from securities and housing property. This tax was expected to bring in some \$9,500,000, which was to be used in financing the other "crisis" measures. These measures provided for: (1) a reduction of agricultural interest rates either by direct subsidy or by conversion; (2) the fixing of a maximum rate of interest on real estate mortgages; (3) government loans for the reconstruction of old housing property; (4) the fixing of a minimum price for grain and butter; (5) devices for raising the price of meat; (6) continuation of the existing hog-control scheme; (7) cheap loans to small traders and craftsmen; (8) loans to needy fishermen; (9) extension of unemployment relief, and (10) the distribution of free meat to the unemployed. These proposals met strong opposition from the Conservative groups in the Rigsdag.

COMMERCIAL TREATIES. Seeking to preserve her chief foreign market as well as her domestic market, Denmark on Apr. 24, 1933, signed an important trade agreement with Great Britain. She received assurance that the bulk of her agricultural exports would have a steady market in Britain for at least three years. In return, the Danish government promised that the country would increase its purchases of British goods. The British agreed to purchase not less than 62 per cent of their bacon and ham imports from Denmark and to admit them duty free; to purchase at least 2,300,000 hundredweight of Danish butter annually; and to take agreed quantities of Danish eggs, cream, condensed milk, and fish. Denmark agreed to purchase 80 per cent of her coal imports from Britain, instead of the 43 per cent previously obtained there; to increase her annual purchases of British steel and iron goods by 25,000 tons; to keep a long list of British imports on the free list; and not to raise the existing tariff on a list of other British imports (see GREAT BRITAIN under *History*). The Folketing approved the treaty on April 27, with only the two Communist members dissenting.

The treaty with Britain offset in some degree the serious blow dealt Danish agriculture by the raising of the German agricultural tariff in February. The new German tariff was estimated to have involved an annual loss to Danish farmers equivalent to between \$4,000,000 and \$5,000,000. Moreover the British succeeded in raising their domestic output of bacon and ham and on November 1 the British government authorized a 16 per cent reduction in bacon and ham imports. This was expected to reduce Danish exports by another \$13,500,000 annually.

NAZI PROPAGANDA. The hostility toward Germany aroused in Denmark and the other Scandinavian countries by the new agricultural tariff was increased as a result of Nazi propaganda within their borders. This agitation was particularly violent and outspoken in the ranks of Nazis of German blood in the Danish South Jutland district, which was returned to Denmark as a result of a plebiscite in 1920. The Nazis made no secret of their intention of uniting South Jutland with Germany. The Danish government prohibited the wearing of political uniforms on April 12, but the Nazis continued their agitation through the schools, churches, agricultural credit associations, and other agencies. Denmark received official assurance from the German government that it had nothing to fear, but the agitation in South Jutland continued. Premier Stauning declared in the Folketing October 17 that the frontier "will be defended by all the means at our disposal." The mutual fear of Nazi aggression led Premier Hansson of Sweden to visit Premier Stauning in Copenhagen a week later and to discuss plans for closer collaboration. Norway, however, proved somewhat cool toward Danish proposals for establishing a united Scandinavian front against Nazi Germany.

THE GREENLAND DECISION. A major reason for the Norwegian coolness, in addition to Norway's relative isolation from Germany, was the victory scored by Denmark in the controversy over the possession of parts of the east coast of Greenland. (For background of this controversy, see the 1931 and 1932 YEAR BOOKS under GREENLAND). The dispute had been submitted to the Permanent Court of International Justice at The Hague. The World Court, in a 12-to-2 decision issued Apr. 5, 1933, held that Norway's occupation of Eastern Greenland was unlawful and invalid. The Norwegian government accepted the decision and withdrew the official it had sent to administer Eric the Red's Land.

DENVER, UNIVERSITY OF. A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn quarter of 1933, excluding duplicate enrollments, totaled 2261 and was distributed as follows: Graduate school, 205; college of liberal arts, 982; school of science and engineering, 130; school of commerce, 510; school of law, 67; school of art, 132; school of librarianship, 30; city college, 227; and extension and correspondence, 153. The enrollment in the summer session of 1933 totaled 715. The faculty had 180 members. The assets of the university consisted of plant assets, \$1,713,309; endowment assets, \$2,176,243; and current assets, \$180,528. The total income for the year was \$490,654. The li-

brary contained 78,000 volumes. Chancellor, Frederick M. Hunter, Ed.D., LL.D.

DEPAUW UNIVERSITY. A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church founded in 1837. The enrollment for the autumn session of 1933 was 1325, including 792 men and 533 women. Of this number, 1240 were registered in the college of liberal arts and 85 in the school of music. The college of liberal arts had a faculty of 81 members and the school of music a faculty of 17. The productive funds of the university amounted to \$5,346,986.60, including assets of \$2,206,839.34 of the Rector Scholarship Foundation. The income from productive funds was \$214,777.76, while the total current income for the year was \$529,083.90; \$69,894.20 of the income from productive funds was for scholarships. The total amount of gifts for permanent funds received during the year was \$88,849.53. The library contained 78,764 volumes. President, G. Bromley Oxnam, D.D., LL.D., Litt.D.

DETROIT, UNIVERSITY OF. An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers, founded in 1877. In the Autumn of 1933 there were 2400 students registered, distributed as follows: arts and sciences, 406; engineering, 446; commerce and finance (day), 256; law, 186; dentistry, 85; commerce and finance (evening), 268; foreign trade (evening), 10; graduate division, 206; Thursday-Saturday School, 216. The summer school registration was 411. The faculty numbered 156. The income in 1932-33 was \$453,485. There were 82,937 volumes in the library. President, Rev. Albert H. Poetker, S.J., Ph.D.

DEUTONS. See *CHEMISTRY*.

DE WINDT, HARRY. A British explorer, died in Bournemouth, England, Dec. 1, 1933. Born in Paris, France, in April, 1856, he attended Magdalene College, Cambridge. After serving his brother-in-law, Rajah Brooke of Sarawak, as aide-de-camp during 1876-78, he traveled by land from China to France in 1887, and two years later from India to Russia by way of Persia. An interest in penal reform led him to inspect the prisons of western Siberia in 1890 and the mines and political prisons of eastern Siberia in 1894. The following year he served as English delegate to the Penal Congress held in Paris. He then resumed his exploration work but while endeavoring to travel from New York to Paris by land for the *Pall Mall Gazette* in 1896, nearly perished in the Bering Straits region, following his capture by a hostile tribe, the Tchuktchees; he was subsequently rescued by a whaling vessel. In 1897 he explored the Klondike gold fields, and three years later was sent to Russia by the London *Daily Express*. While serving the same newspaper he succeeded in journeying by land from Paris to New York during 1901-02, negotiating the distance of 18,484 miles via Siberia, Bering Straits, and Alaska by foot, horseback, and rail in 248 days.

His companions were the Viscomte de Clainchamp Belle Garde, George Harding, and Stephen Rastorugyeff, a Cossack. Three years later he traversed the Balkan States for the *Westminster Gazette* and during 1911-13 traveled in the Sahara and Morocco. Mr. De Windt was a Fellow of the Royal Geographical Society. He described his adventures in *On the Equator* (1882); *From Peking to Calais by Land* (1887); *A Ride to India* (1890); *Ennui de Voyage* (Poems, 1890); *Siberia As It Is* (1892); *The New Siberia* (1895); *Through the Gold Fields of Alaska to Behring Straits* (1898); *True Tales of Travel and Adventure* (1899); *Finland As It Is* (1901); *From Paris to New York by Land* (1903); *Through Savage Europe* (1905); *My Restless Life* (1908); and *Russia As I Know It* (1916).

DILLON, EMILE JOSEPH. A British journalist, died in Barcelona, Spain, June 9, 1933. Born in Ireland in 1855, he received his education at the Collège de France, Paris, and the Universities of Innsbruck, Leipzig, and Tübingen. From the University of St. Petersburg he received the degree of Master of Oriental Languages and from Louvain University that of Doctor of Oriental Languages. The University of Kharkoff conferred on him the degree of Master of Comparative Philology and Classical Languages in 1883 and that of Doctor of Comparative Philology in 1884 in recognition of such works, in Russian, as *Dualism in the Zend Avesta and The Place Occupied by the Armenian Language in the Indo-European Family*. He published also *The Home and Age of the Avesta*, *L'Alphabet de la Langue Bactrienne*, *Die Transcription der Eranischen Sprachen*, *History of the Scandinavian Literature in the Middle Ages* (in Russian), *Maxim Gorky*, and *The Original Poem of Job*. In 1885 he founded *Le Muséon*.

Appointed Russian correspondent for the *London Daily Telegraph* in 1887, Dr. Dillon held that post until the outbreak of the World War. He represented the *Telegraph* also as special correspondent in Armenia during 1894-95, arousing the protest of the Christian world by his description of the atrocities committed by the Turks. Before and during the Spanish-American War he was in Spain, and on the outbreak of the Boxer Rebellion in China. On the conclusion of the Russo-Japanese War in 1904 he accompanied Count Witte to the Portsmouth Peace Conference in the capacity of adviser. He covered the Dreyfus trial at Rennes in 1906 and was an eyewitness of the Portuguese Revolution of 1910. After the Balkan Wars of 1912-13 he attempted to negotiate a pacific agreement between Greece and Turkey.

During the World War Dr. Dillon published such timely works as *A Scrap of Paper* (1914); *From the Triple to the Quadruple Alliance: Why Italy Went to War* (1916); *Ourselves and Germany* (1916); and *The Eclipse of Russia* (1918). The Paris Peace Conference found him in attendance, and he published his impressions under the title *The Peace Conference* (1920). He recorded the march of events after the War, in *Mexico on the Verge* (1921); *President Obregon*, *A World Reformer* (1923); and *Russia Today and Yesterday* (1929). His memoirs, *Leaves from Life*, were published in 1932.

DISARMAMENT. The Disarmament Conference at Geneva resumed its work on Feb. 2, 1933—one year after its first meeting—with a general debate on the French plan for disarmament. This plan rested upon a general agreement implementing the Kellogg Pact with provisions for consultation and sanctions, and a special organization for Continental Europe based on a uniform military system and a European security pact. The security issue was referred to the Political Commission where it was discussed in relation to the European pact, while questions of disarmament were reserved for the General Commission itself.

The discussions from the outset revealed a widening breach between France and the states determined to preserve the *status quo* on the one hand, and Germany and Italy, leaders of the revisionist bloc, on the other. To the revisionist powers the French plan was unacceptable in many vital respects. Germany criticized the plan for its failure to provide for effective reduction or abolition of aggressive weapons. It raised objections to the European security pact and the proposed international force, as well as the international control of civil aviation. Meanwhile France, alarmed by the triumph of Hitlerism in Germany, declined to consider further reductions except as part of the general plan for security. When the principle of the French security pact was put to a vote on March 7, 14 countries, including France and the Little Entente, voted in favor, while five—Germany, Italy, Austria, Hungary, and Holland—voted against. Moreover, an effort to appoint a committee to study the proposal further was blocked when Germany and Italy refused to participate on the ground that they could not cooperate on a proposal to which they were opposed.

On March 2 some progress appeared to have been made when the Political Commission, with several states abstaining, unanimously adopted a British proposal to renounce the use of force in the settlement of international disputes between European states. This proposal supplemented the Anti-War Pact which, while renouncing war, does not refer explicitly to acts of force. The United States abstained from this vote, apparently on the ground that the proposed agreement would affect only European countries.

Another effort to clarify the Anti-War Pact and the League Covenant was made by the Soviet delegation which on February 6 proposed a definition of "aggressor" nation. The Soviet definition would make the use of armed force in the territory of another state an act of aggression, regardless of the justification. Apparently because of its possible effect on the Far Eastern controversy, the Soviet definition was viewed with extreme caution by the great powers, and was criticized by Great Britain and the United States as well as Japan.

The Disarmament Conference on March 27 unanimously voted to accept the British draft treaty as a basis for discussion and to adjourn until April 25, thus reversing its unanimous decision of March 23 to continue work until Easter. This vote had been practically forced on the conference by the Little Entente and Poland, which believed that the Mussolini plan for a concert of the four great powers—Italy, France, Germany, and Great Britain—boded no good to the rights of small states.

In April, 1933, Europe was confronted by one of the most serious political crises since the close

of the World War. By May the atmosphere had materially changed. The three events which contributed to this striking change were Hitler's address to the Reichstag on May 17; the news published on May 21 that the Mussolini four-power pact had been revived in modified form; and the American declaration of policy made by Norman H. Davis at the Geneva Disarmament Conference on May 22. As a result of these developments, the German delegation abandoned its opposition to the British plan for the reorganization of European armies. Under this plan the five leading armies of Europe would each be fixed at 200,000 men; every government would abolish tanks above 16 tons and large guns above 155 millimeters; and military aircraft would be drastically reduced—to 500 planes in the case of each great power.

In his appeal of May 16 President Roosevelt gave Chancellor Hitler an opening for a moderate answer to the extremist statements of Viscount Hailsham and others. Hitler on May 17 not only accepted the American proposal for a non-aggression pact, but gave assurances that Germany did not wish to change the map of Europe by force or to "Germanize" alien peoples. He also accepted the principle of international supervision of armaments, provided it is universal.

Ambassador Davis's statement accepted the British arms proposal as a forward step. Apparently having Germany in mind, Mr. Davis declared that "if at this decisive point any nation should fail to give conclusive evidence of its pacific intentions and insist upon the right to rearm, even though the other powers take substantial steps toward disarmament, then the burden of the Disarmament Conference, with the incalculable consequences of such a failure, would rest on the shoulders of that nation."

Going further than any previous spokesman of the American government, Mr. Davis proceeded to say that if a disarmament treaty could be concluded, the United States would assist in "the organization of peace." First, it would be "willing to consult the other States in case of a threat to peace with a view to averting conflict." Second, "in the event that the States, in conference, determine that a State has been guilty of a breach of the peace in violation of its international obligations, and take measures against the violator, then, if we concur in the judgment rendered as to the responsible and guilty party, we would refrain from any action tending to defeat such collective effort which these States may thus take to restore." Third, the United States was "heartily in sympathy with the idea that means of effective, automatic, and continuous supervision should be found whereby nations will be able to rest assured that, as long as they respect their obligations with regard to armaments, the corresponding obligations of their neighbors will be carried out in the same scrupulous manner." Finally, Mr. Davis intimated that the "simplest and most accurate definition of an aggressor is one whose armed forces are found on alien soil in violation of treaties."

The Geneva Conference adjourned on June 29 until October 16. On June 1, the General Commission adjourned after the reading of the Draft Convention which they had prepared, to meet again not later than July 3. The Bureau was instructed to prepare a text for the second reading and to request Arthur Henderson, president of the Conference, to undertake any useful negotia-

tions with a view to the preparation of that text. The General Commission unanimously decided on June 8 that the Draft Convention submitted by the United Kingdom delegation should be accepted as the basis for the future Convention.

Mr. Henderson, on June 27, informed the Bureau, that owing to the pressure of work devolving on the Delegates at the London Conference he had been unable to make satisfactory progress with the negotiations, and that in order to carry them to a successful conclusion he proposed that the work of the Conference should be adjourned until October.

Herr Nadolny, the German delegate in the General Commission, opposed adjournment, but added that the future Convention would be faithfully and loyally observed by Germany. Whereupon, the Commission authorized the President unanimously, save for Germany's adverse vote and Hungary's abstention, to enter into the necessary negotiations with a view to preparing a text of the second reading of the Draft Convention. It was then that the General Commission adjourned until October 16.

As the Prime Minister of Great Britain pointed out when he presented the Draft Convention, it was a compromise proposal, designed to embody the maximum of agreement likely to be achieved at the present time. It involved a degree of disarmament on land and in the air. The naval clauses were intended to serve merely as a stop-gap until the next naval conference in 1935.

Up to July 23, 1932, the work of the Conferences consisted of discussions of general principles; from July 23, 1932, until Mar. 22, 1933, it labored on the tasks of formulating general principles; after Mar. 23, 1933, decisions of principle gave way to definite decisions in the form of this Draft Convention.

Disarmament conversations which began in September in Paris between representatives of France, Great Britain, Italy, and the United States and continued in Geneva proved more important than the formal proceedings of the Disarmament Conference which resumed its work at Geneva on October 16.

Germany's response to the armament terms advanced by Great Britain, France, Italy, and the United States at the conclusion of the private conversations in Geneva in October exposed the full gravity of the crisis that confronted the Disarmament Conference. For the first time since the last war Europe was faced with the demand of a defeated power not merely for treaty revision and equality, but for actual rearmament; and for the first time in its seventeen months' history the Conference was brought face to face with the political issue which had divided Europe for a decade. The crisis differed only in degree from that which faced the Conference in March, when Ramsay MacDonald presented the British draft convention as a possible compromise between the extreme demands of France and Germany. In March Germany was not prepared openly to press its demand for rearmament to the extent of requesting "samples" of the weapons forbidden in the Treaty of Versailles. Hitler's conciliatory speech on March 17, however, preserved all the essential demands of the German government and merely postponed the inevitable conflict.

As in March, Germany's position in October was based on the complete application of the principle of equality. The only essential difference was that, in the answer given to the four great

powers on October 6, the Nazi government officially requested samples of all weapons allowed to other powers under the proposed disarmament treaty, but forbidden to Germany in the Treaty of Versailles. The German answer laid down three counter-proposals:

First, that the trial period of four years, suggested by France for testing a system of supervision of armaments, should be reduced to six months;

Second, that definite reductions in armaments must be made simultaneously with the application of the system of supervision;

Third, that samples of all armaments retained by other countries must be allowed to Germany.

The first effect of the German terms was to strengthen the unity of the other great powers. Great Britain's position was revealed by Stanley Baldwin, the second ranking Minister in the British cabinet, in a speech before the Conservative party conference on October 6. Mr. Baldwin warned that any country that deliberately prevents a disarmament convention would have no friend in the civilized world, and reaffirmed Great Britain's pledge under the Locarno treaty. In referring to Locarno he declared: "What Britain has signed she will adhere to. She adhered to her signature regarding Belgium, for her signature and her agreements are sacred."

While France, Italy, and the United States made no official comment on the German demands, they indicated their strong opposition to all demands for rearmament. When the Bureau of the Conference met on October 9 to prepare for the full meeting of the Conference on October 16, Germany faced what appeared to be a virtual united front on the issue of rearmament. The crisis, however, was not relieved by the growing unity of the armed powers. Having admitted the principle of equality, the conference was still confronted with the question of applying this principle in a disarmament convention.

On October 14, at a morning session, Sir John Simon delivered a legalistic, unimpassioned speech summarizing the British, French, and American stand. It set the official seal on the triple union. Although couched in conciliatory terms, it firmly denied Germany the right to any armaments until the end of the supervisory period, when she could begin to rearm gradually. She would not reach equality with the other powers until the end of the eighth year. If the bureau had been fearful of the effects of such a firm stand they were completely astounded by the swiftness with which Hitler struck back. Without waiting for twelve hours to pass, he announced Germany's withdrawal from the Disarmament Conference and from the League and all its works. His action left the world astounded, shocked and for the moment gravely apprehensive. Germany's big guns had been fired on the eve of the convening of the Disarmament Conference proper, scheduled October 16. Its first session lasted only half an hour. The business consisted of approving a stern reply to Germany's notification of withdrawal. After that it was voted to adjourn until October 26 so that the delegates could "consult their governments."

Norman Davis's instructions from the first had been to concern himself solely with the problem of disarmament without involving the United States in European politics. These instructions he had followed with the utmost discretion. On learning that there was some uneasiness at home over his close alignment with the positions of France and Britain, he issued a clarifying statement to the

press: "We are in Geneva solely for disarmament purposes. We again make clear that we are in no way politically aligned with any European power. During this week there will be consultations between the capitals of Europe. We do not wish to take an active part in these, as the implications are clearly political."

In Washington the American policy was made doubly clear when Secretary of State Hull gave newspapermen an emphatic declaration that the government would remain aloof from the Geneva Conference until and if the direct problem of arms reduction again came to the front. Ambassador Davis decided to remain in Geneva as a neutral observer and to watch developments. His position was made additionally delicate by the wish of the League that the United States continue to exert its influence as a consultative power. It was thought highly undesirable that, considering the nervous state of Europe, the American government should take advantage of its geographical isolation and retire completely from the field. As Ambassador Davis put it, "the time has come for all of us to keep our heads and use them more than ever."

Opinion at Geneva and elsewhere continued to be divided as to the wisdom of adjourning the disarmament conference. The bureau or steering committee of the conference voted on October 25 a recommendation to the general disarmament commission that the conference should be resumed not later than December 4, and that the bureau in the meanwhile should continue the work of the conference. But on November 21, Mr. Henderson fixed the middle of January, 1934, for the reconvening of the conference.

The end of the year found the situation unchanged with regard to the attitude of France and Germany toward disarmament, with Great Britain in the habitual rôle of a friendly but unpredictable mediator. A conversation on December 21 between the British and French Foreign Ministers, Sir John Simon and Joseph Paul-Boncour, brought out that France was still definitely opposed to Germany's rearmament proposals. In the meantime, Hitler asked when France was going to begin her reductions of armaments. See NAVAL PROGRESS.

DISCIPLES OF CHRIST. A communion, known also as the Churches of Christ, which sprang from a movement for Christian unity in American Presbyterian circles at the beginning of the nineteenth century, under Barton W. Stone in Kentucky and under Thomas and Alexander Campbell in western Pennsylvania. In 1933 the total church membership throughout the world was 1,716,958, and in the United States and Canada, 1,575,451. The Bible school enrollment for the world was 1,258,976, and for the United States and Canada, 1,188,061. Contributions for missionary, benevolent, and educational purposes, reported for the fiscal year in the United States and Canada, totaled \$2,482,902. The work was carried on through the United Christian Missionary Society, Board of Education, Board of Temperance and Social Welfare, Association for the Promotion of Christian Unity, and Pension Board, besides missionary societies in the several States and provinces. The International Convention at its meeting in Pittsburgh in October, 1933, approved the separation of the National Benevolent Association from the United Christian Missionary Society, also the separation of the Board of Church Extension from the American Christian Missionary Society (a constituent member

of the United Christian Missionary Society) and the department of church erection from the United Christian Missionary Society, merging the latter two into one Church Extension Board.

The denomination's foreign missionary work in 1933 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Tibet (Batang, on the border). During the year there were 9301 baptisms. The communion maintained 539 mission schools with an enrollment of 17,573 and 15 hospitals and 13 dispensaries which gave 460,174 treatments. Work in America was conducted among the French, Highlanders, immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The department of benevolence maintained six homes for children, an equal number of homes for the aged, and one hospital. In 1933, 29 colleges cooperated with the Board of Education. Among the periodicals published by the denomination are *World Call*, *Christian Evangelist*, *Christian Standard*, and *Christian Unity Quarterly*. The acting president of the International Convention at the close of the year was the Rev. George A. Campbell of St. Louis, Mo. The Rev. Stephen J. Corey was president of the United Christian Missionary Society, whose headquarters are at 222 Downey Avenue, Indianapolis, Ind.

DIVORCE. See MARRIAGE AND DIVORCE; LAW.

DIXON, JAMES MAIN. An American educator and author, died in Los Angeles, Calif., Sept. 27, 1933. He was born at Paisley, Scotland, Apr. 20, 1856. On his graduation from St. Andrews University in 1879 he was appointed professor of English and secretary of the Imperial College of Engineering in Tokyo, Japan, and seven years later was called to the Imperial University in the same capacity. In 1887 he founded in Tokyo the Ladies' Institute and the following year was decorated by the Emperor for his contribution to the advancement of higher education in Japan.

Dr. Dixon came to the United States in 1892 to accept the chair of English literature at Washington University, St. Louis. After acting during 1903-04 as president of Columbia College, Milton, Ore., he was called to the University of Southern California, serving as professor of English literature until 1911 and as professor of Oriental studies and comparative literature until 1931. Among his works were: *Twentieth Century Life of John Wesley* (1902); "Matthew Arnold" in *Modern Poets and Christian Teaching* (1906); *A Survey of Scottish Literature in the Nineteenth Century* (1907); *The Spiritual Meaning of Tennyson's "In Memoriam"* (1920); *Manual of Modern Scots* (with William Grant, 1920); and *Emotional Values in Australasian Verse* (1931). He compiled also a *Dictionary of Idiomatic English Phrases* (1891).

DOAK, WILLIAM NUCKLES. An American labor leader and former United States Secretary of Labor, died near Washington, D. C., Oct. 23, 1933. Born at Rural Retreat, Wythe Co., Va., Dec. 12, 1882, he attended the Southern Business College at Bristol, Va., and in 1900 entered the service of the Norfolk and Western Railway Co. in the capacity of yardman, being later promoted to conductor and assistant yardmaster. He began his career as a labor leader in 1904 when he became a member of the Brotherhood of Railroad Trainmen, serving as chairman of the local grievance committee and then as president of his local lodge. From 1908 to 1916 he was general chairman of the brotherhood of the Nor-

folk and Western System, from 1912 to 1916 chairman of the State legislative board for West Virginia, and from 1909 to 1916 secretary-treasurer of the southern association of general committees for the Order of Railroad Conductors and Brotherhood of Railroad Trainmen.

During the Federal government's war-time administration of railroads Mr. Doak was a member of the railway board of adjustment, organized for the purpose of handling disputes between the railways and the railway brotherhoods, and from 1921 to 1928 represented the Brotherhood of Railroad Trainmen on the train service boards of adjustment for the southeastern and eastern territories. He assisted also during this period in the adjustment of numerous wage movements, including the national movement of 1919-20 and the territorial movements of 1923-24 and 1926-27. Elected a vice-president of the Brotherhood of Railroad Trainmen in 1916, Mr. Doak served after that date as its national legislative representative in Washington. In 1927 he was its acting president and after 1928 editor of its organ, the *Railroad Trainmen*.

In December, 1930, President Hoover appointed Mr. Doak Secretary of Labor, succeeding James J. Davis. His tenure of this office was marked by vigorous enforcement of the policy of deporting so-called undesirable aliens on the grounds either that they were public charges or were engaging in activities subversive to the political and economic institutions of the United States. On the expiration of his term Mar. 4, 1933, he resumed his labor organization activities.

DODD, LEE WILSON. An American author and playwright, died in New York City, May 16, 1933. Born at Franklin, Pa., July 11, 1879, he was graduated from Yale University in 1899 and after attending the New York Law School was admitted to the bar in 1902, acting as chief counsel for the Standard Oil Co. Five years later, however, he turned to literature, in which he made a distinct accomplishment for his salty wit, gay fancy, and satirical touch. The most typical of his novels was *The Golden Complex* (1927), a satire on the excesses of psychoanalysis. Among his other prose works were: *His Majesty Bunker Bean* (1915); *Pals First* (1917); *The Book of Susan* (1920); *Lilia Chenoworth* (1922); *The Girl Next Door* (1923); and *The Sly Giraffe* (for children, 1925). In addition to dramatizations of *His Majesty Bunker Bean* and *Pals First* he wrote the plays *The Return of Eve* (1909); *Speed* (1911); and *The Changelings* (1923). His poetry included *A Modern Alchemist* (1906); *The Middle Miles* (1915); and *The Great Enlightenment* (1928).

Mr. Dodd served as critic for the *Saturday Review of Literature* and at various times was special lecturer on the English drama and kindred subjects at Smith College, Wesleyan University, and the Bread Loaf (Vt.) Writers' Conference, sponsored by Middlebury College. He was also a member of the English faculty of Sarah Lawrence College and previous to his death was appointed associate professor in the drama department of Yale University, succeeding George Pierce Baker.

DOGS. Despite a slight falling off in the number of entries in the shows, and a lessening of purses in many shows, the dog show sport kept very much alive in 1933 and definite trends were shown both here and abroad. In the United States there were ten more licensed bench shows than the year before and one more field trial and at-

tendance was quite a bit greater, especially at the outdoor fixtures. Of course, there was less importing of stud dogs from England and other countries, but the fine specimens of breeds in the United States served to keep the thoroughbred demand satisfied, although prices for fine dogs have undeniably not approached their boom time level.

The champion dog of the year is generally recognized as the winner of best-in-show at the Westminster in New York in February. In 1933 this coveted ribbon went to S. M. Stewart's aire-dale, Ch. Warland Protector of Shelterock judged by Mrs. M. Hartley Dodge, the first woman ever to judge best at Westminster. Warland Protector did not perform as well afterwards as had previous Westminster winners and probably the most consistently fine dog of the year was Ch. Heather Reveller of Sporrán, Scottish terrier, owned by S. S. Van Dine, author. Heather Reveller was best-of-breed in New York and took innumerable bests along the circuit. Epping Eville, wire-haired fox terrier bitch, owned by John G. Bates, was adjudged best in show at Mrs. Dodge's Morris and Essex show at Madison, N. J. in June. This was the largest one-day show ever held in the world, with a record total of 2343 dogs benched.

Many breeds increased in popularity during the year and others slipped back in the public fancy. The Cocker spaniel made a fine showing and deserved to be ranked as the most popular breed of 1933.

DOLE. See UNEMPLOYMENT; LABOR, AMERICAN FEDERATION OF; GREAT BRITAIN; GERMANY.

DOLLFUSS, ENGELBERT. See AUSTRIA; MILITARY PROGRESS.

DOMESTIC RELATIONS. See LAW.

DOMINICA. See LEEWARD ISLANDS, BRITISH.

DOMINICAN REPUBLIC (SANTO DOMINGO). A West Indian republic, occupying the eastern part of the island of Hispaniola (Haiti). Capital, Santo Domingo.

AREA AND POPULATION. The republic has an area of 19,332 square miles. The estimated 1932 population was 1,275,000 (894,665 at the 1920 census). The population is composed of: Whites (mostly of Spanish descent), 25 per cent; negroes, 25 per cent; mestizos or other mixed races, 50 per cent. Populations of the chief cities (estimated, 1932) were: Santo Domingo, 47,200; San Pedro de Macoris, 31,000; Santiago, 25,000; La Romana, 10,000; Puerto Plata, 9,000. There were about 320,000 illiterates in 1930; school enrollment in 1931, 75,209.

PRODUCTION. Agriculture is the principal occupation and sugar, cacao, coffee, tobacco, rice, and corn are the main crops. Production is best measured by the export statistics (see *Commerce*). The raw sugar yield in 1932-33 was estimated at 446,000 short tons. The 21 sugar centrals are mostly owned and operated by American companies. The livestock estimate for 1930 was 900,000 cattle, 1,100,000 swine, 63,000 sheep (in 1932), 650,000 goats, and 345,000 horse, mules, and asses. The forests produce lignum-vitæ, mahogany logs, railroad ties, and dyewoods. There is little mining and sugar refining is the only important manufacturing industry.

COMMERCE. Dominican imports were valued at \$7,794,000 in 1932 (\$10,152,000 in 1931) and exports at \$11,164,000 (\$13,067,000 in 1931). Leading imports, by value, in 1932 were: Cotton manufactures, \$1,515,000 (including piece goods, \$1,106,000); machinery, \$314,000; iron and steel,

\$436,000; jute bags, \$432,000; gasoline, \$409,000; rice, \$396,000. The principal 1932 exports, by quantity and value, were: Raw sugar, 969,013,000 pounds, \$6,859,000; coffee, 14,137,000 pounds, \$1,255,000; cacao, 38,275,000 pounds, \$1,027,000; sugar cane, 258,212 tons, \$550,000; molasses, 191,988,000 pounds, \$441,000. The United States, including Puerto Rico, supplied 59.3 per cent of the 1932 imports (58.2 in 1931) and took 26 per cent of the exports (29.8 in 1931). The United Kingdom purchased 43.4 per cent of the 1932 exports (31.0 per cent in 1931); France, 18.9 (23.7).

Preliminary 1933 trade returns showed imports of \$9,322,688 and exports of \$9,625,473.

FINANCE. Government receipts in 1931 were reported at \$7,311,000 and expenditures at \$8,403,000. For 1932 actual revenues were reported at \$7,527,000 and expenditures at \$7,263,000. The 1933 budget authorized expenditures of \$7,063,000 and called for revenues of \$7,094,000. On Dec. 31, 1932, the external funded debt totaled \$16,498,000 (\$16,593,500 on Dec. 31, 1931) and the estimated floating debt was about \$3,500,000. Sinking fund payments on the external debt were suspended in October, 1932, but interest payments continued to be met. The United States dollar is the unit of currency.

COMMUNICATIONS. Railways of the republic in 1932 extended 788 miles, including 144 miles of public carrier lines (62 miles state owned) and 644 miles of sugar company railways. The high-way mileage in 1930 was 845 miles (686 of macadam). A contract for a \$300,000 bridge over the Higuamo River was awarded to an American firm in 1933. Santo Domingo and San Pedro de Macoris are ports of call on the Pan American Airways system. In 1932, 1375 vessels of 1,864,000 net registered tons entered the Dominican ports and 1339 ships of 1,880,000 tons cleared. A new fast freight and passenger service between the northern ports of the country and New York, providing refrigeration facilities, was inaugurated in August, 1933.

GOVERNMENT. The Constitution vests executive power in a president elected for four years and a cabinet chosen by him. It provided for a senate of 12 members and a lower chamber of 33 members, all elected for four years, supposedly by direct suffrage. President Rafael Leonidas Trujillo Molina, who assumed office Aug. 16, 1930, following the revolution of February, 1930, scrapped the former bi-party system and organized a new (Dominicano) party, in which all members of the government and many state employees and citizens enrolled. All other parties went out of existence and those opposition leaders who did not go into exile retired from public life.

HISTORY. News from the Dominican Republic during 1933 indicated that President Trujillo was consolidating his dictatorship and preparing to secure reelection in 1934. There were repeated charges that the President was severely repressing all opposition. On Sept. 23, 1933, Secretary of the Navy Swanson announced the appointment of Major Thomas E. Watson of the U. S. Marine Corps to assist President Trujillo in training the Dominican army. This assignment aroused a protest from Dr. Raymond L. Buell of the Foreign Policy Association, who said that "Secretary Swanson is unconsciously inaugurating a policy of underwriting dictatorship in the Dominican Republic. . . ."

President Trujillo during 1933 inaugurated a policy of establishing farm colonies on unused

land. It was reported that more than 300 families were placed on the land and supplied with tools and expert advice in their farming enterprises.

By a decree of Nov. 22, 1933, the President ordered that a special referendum be held at the same time as the elections of 1934 to determine whether the women of the republic desired the right to vote and hold office on the same terms as men. If the vote favored woman suffrage, an amendment to the Constitution would be in order.

DONALD, SIR ROBERT. A British journalist, died in London, Feb. 17, 1933. Born in Banffshire, Scotland, in 1861, he served his journalistic apprenticeship as reporter and feature writer in Edinburgh, Northampton, Paris, New York, and London. In 1893 he founded, and thereafter managed, the *Municipal Journal* and the *Municipal Year Book*. Joining the staff of the *London Daily Chronicle* in 1902, he became editor in 1904 and thereafter devoted his energies, until his retirement in 1918, to making this one of the sanest and most progressive of British Liberal journals. He was also from 1911 to 1918 managing director of the United Newspapers, Ltd., and at the time of his death was chairman and managing director of the Everyman Publishing Co., Ltd.

During the World War Sir Robert was connected with the Ministry of Information as director of British propaganda in neutral countries. He assisted during 1912-14 in the organization of the British-American Peace Centenary Committee, of which he was honorary secretary, and in raising funds for the purchase of Sulgrave Manor, Washington's ancestral home. In 1924 he was chairman of the publicity committee of the British Empire exhibition, being responsible for the inquiry which led to its reorganization. He was also chairman in 1924 of the Committee on Imperial Wireless Telegraphy and of the Committee on Organization of Imperial Wireless Services and was a member of the Committees on Reconstruction of Local Government (1917-18), Royal Commission on London Government (1923), Royal Commission on Transport (1930), and Committee on British Industries Fair (1930).

One of the organizers of the Imperial Press Conference of 1909, Sir Robert served as chairman of the Empire Press Union from 1915 to 1926 and as vice-chairman from 1926 until his death. He was also president in 1913 of the Institute of Journalists, and in 1924 was created a Knight of the Grand Cross of the Order of the British Empire. Among his publications were: *Imperial Press Conference in Canada* (1921); *A Danger Spot in Europe* (1925); and *The Tragedy of Trianon* (1928).

DOUBINE ERADICATION. See VETERINARY MEDICINE.

DOYLE, THE RT. REV. MGR. RICHARD BARRY. See BARRY-DOYLE, THE RT. REV. MGR. RICHARD.

DRAKE, DURANT. An American educator and philosopher, died in Poughkeepsie, N. Y., Nov. 25, 1933. He was born in Hartford, Conn., Dec. 18, 1878, and was graduated from Harvard University in 1900, receiving the Ph.D. degree from Columbia University in 1911. After serving for a year as instructor in philosophy at the University of Illinois, he became in 1912 associate professor of ethics and philosophy at Wesleyan University and in 1915 professor of philosophy and education at Vassar College. His early position as a philosopher, as set forth in *The Problem of Things in Themselves* (1911), was that of an epistemological dualist, impressed by the dual-

ity between the cognitive state, which is the vehicle of knowledge, and the object known. This view was later modified to that of an epistemological monism, namely, that in so far as perception is accurate the data of our experience are the very physical things that surround us.

Dr. Drake was one of a group of seven who published the *Essays on Critical Realism* (1920). Among his other writings were: *Problems of Conduct* (1914); *Problems of Religion* (1916); *America Faces the Future* (1922); *Mind and Its Place in Nature* (1925); and *The New Morality* (1928). According to the personal statement, "The Philosophy of a Meliorist," set forth in *Contemporary American Philosophy* (1929), he held that the consummation of happiness was through a rigorously scientific training in fact and a parallel development of human affections and of religious ardor.

DRAMA. During its first nine months the year 1933 produced but little in the Theatre or the Drama, particularly in the United States, to distinguish it from its immediate predecessors. If any degree of difference, other than that of names and dates, was perceptible, it lay in the still more pronounced fewness of the new plays with even slight claims to importance and the staggering percentage of quick, decisive failures. Probably in no like period before have so many offerings been withdrawn after only a performance or two, and runs of a mere fortnight or less were too common to arouse comment. Certainly never before since America accumulated a substantial Drama has so great reliance been placed on revivals of very recent successes, usually at reduced prices, for keeping the playhouses open at all. But with the coming of fall a few bright rays of hope flared up and, with something to feed upon, taken in conjunction with certain appreciable reforms in the manner of marketing the tickets of admission, the public's taste showed signs of once more turning theatre-ward.

The first production of the year to achieve even moderate popularity was *Pigeons and People*, of which George M. Cohan was both author and star. It could scarcely be described as a play—scarcely, indeed, he described it at all save, perhaps, in its writer's own words, as a "comic state of mind in continuous action." It contained no perceptible plot but, instead, an abundance of highly entertaining discourse on a variety of topics, phrased in the best Cohan manner and delivered accordingly, often very nearly as a monologue, with a number of contributory characters introduced as foils. Next came a musical comedy, *Pardon My English*, by Herbert Fields and the brothers Gershwin, but not a great hit as such things go. Then Elmer Fisk blazed forth in an honest outburst of long-smoldering indignation at the slough into which political and economic conditions have been permitted to bring this country. This bitter and violent protest he entitled *We, the People*, but though undeniably powerful and interesting by virtue of the very heat of his wrath, it proved too pessimistic and disturbing for the public fancy, falling just short of 50 performances. The same month, January, brought also one of the few substantial successes of the first half of the year, Noel Coward's long-heralded *Design for Living*, a witty, sophisticated, highly immoral and hilariously nonsensical concoction which yet supplied the material for scintillating portrayals by Alfred Lunt, Lynn Fontanne and Mr. Coward himself, which, after

all, was the particular purpose of its existence.

Evensong, an adaptation by Edward Knoblock and Beverly Nichols of the latter's novel of the same name, was brought over from London together with its British star, Edith Evans, but failed to find here the marked favor with which it had met at home; and this despite Miss Evans' admirable stage portrait of a prima donna fighting a brave but losing battle with oncoming age. *Melody*, a musical romance by Edward Childs Carpenter with lyrics by Irving Caesar and score by Sigmund Romberg, was a pleasant feature of the Spring—a piece of the type that covers several generations of the same family, with Evelyn Herbert appearing as both heroine and heroine's granddaughter, and with Everett Marshall, Hal Skelly, Victor Morley, Harrison Brockbank, Walter Woolf, and Jeanne Aubert also agreeably involved. Then followed one of the season's inexplorable surprises, an extremely slender bucolic comedy by James Hagan bearing the name *One Sunday Afternoon*, an offering with little to recommend it beyond a cloying wholesomeness and rustic brand of humor, yet somehow it managed to round out a run of approximately ten months. The principal characters were taken by Lloyd Nolan, Francesca Bruning, Percy Helton, and Mary Holsman, and Leo Bulgakov was responsible for the direction. Through the unaccountable irony of fate a much better play by Owen Davis, entitled *A Saturday Night* and presented at about the same time, was able to endure for but five weeks, even with such capable players as Peggy Wood, Hugh O'Connell, Arthur Margetson, Owen Davis, Jr., and young Richard Jack to enact the participants in the varied events of a most hectic evening.

For her second offering of the season Katharine Cornell selected Sidney Howard's *Alien Corn*, a somewhat sombre drama of frustration, disappointment and yearning, involving the tragedy of the aspiring genius with wings clipped by economic necessity. The play was staged beautifully and reflected high credit upon all concerned—especially the star, but likewise her husband and director, Guthrie McClintic, and the notable cast, which included James Rennie, Siegfried Rumann, Charles Waldron, Luther Adler, Charles D. Brown, E. J. Ballantine, Jessie Busley, and Lily Cahill. It scored a run of nearly 100 performances. Not so happy was the fortune of the Theatre Guild with *American Dream*, the first drama of George O'Neil, poet. The piece is a trilogy, whose three distinct episodes depict the manner in which a family characteristic can persist down through the generations, being modified—or, in the instance illustrated, degenerating—in the processes of civilization. Notwithstanding certain striking features, the piece barely lasted out the Guild's subscription requirements.

With March arrived a Negro folk drama on the religious order, *Run, Little Chillun*, the work of one Hall Johnson. The piece was chiefly remarkable for the fervor, abandon, and atmosphere injected into one of its four scenes, on the strength of which, as acted effectively by its Negro cast, it piled up well over 100 performances. March 1 witnessed also the première of an only slightly lesser hit, *Forsaking All Others*, a pleasant enough comedy by Edward Roberts and Frank Cavett, which restored to the American stage one of its players who had been carving a niche for herself in London during several

recent seasons, the vibrant Tallulah Bankhead, whose return occasioned no little acclaim. It also introduced to the legitimate stage as a regular actor Fred Keating, the genial young magician whose tricks have been gracing vaudeville and revues for a number of years. Two other productions of the same month likewise passed the century mark—*Strike Me Pink!*, a revue in which Hope Williams, Jimmie Durante, Hal Le Roy, Lupe Velez, and Roy Atwell were the luminous features, and a Theatre Guild offering, Maxwell Anderson's *Both Your Houses*, which was awarded the Pulitzer Prize for 1933. Despite the source of its title, this work bore no relation to the Montagues and Capulets but concerned rather the two legislative branches of our national government whose operations had aroused much unfavorable criticism. By a concatenation of circumstances, however, Mr. Anderson's scathing impugment reached the stage just as the new administration at Washington was effecting at least a temporary change in the conditions under arraignment, but even with its point thus slightly blunted, the piece gained for its author the distinction already noted and fair patronage for its sponsors.

Eva LeGallienne, who had transported her stage production of *Alice in Wonderland* northward from 14 Street to 42 Street, New York City, in time for the 1932 holiday season, now added to the bill a revival of her Civic Repertory presentation of Tchekov's *The Cherry Orchard*, an exceptionally interesting and creditable offering which was alternated with *Alice* for several weeks. Alla Nazimova repeated her admirable portrayal of the charming but impractical Madame Ranevsky while Josephine Hutchinson and Miss LeGallienne herself again had the rôles of the daughter and step-daughter respectively. A harum-scarum comedy entitled, madly but appropriately enough, *Three-Cornered Moon*, introduced a new playwright, Gertrude Tonkonogy, and kept Ruth Gordon, Cecilia Loftus, Brian Donlevy, Elisha Cook, Jr., and several others hilariously occupied for some nine or ten weeks; but six proved the limit for a slight though agreeable piece called *The Party's Over*, likewise by a little-known writer, Daniel Kussell. This one employed the services of Harvey Stephens, Katharine Alexander, Effie Shannon, Peggy Conklin, and Ross Alexander.

April brought three new works from which more was expected, mainly by reason of their authorship, than was achieved, not one of them lasting even a full month. These were Somerset Maugham's *For Services Rendered*, well received in London the previous year but too harrowing and gloom-drenched for the times in New York; *The Comic Artist*, by Susan Glaspell and Norman Matson; and *Nine Pine Street*, rewritten by John Colton and Carleton Miles from a play by William Miles and Donald Blackwell, based rather freely on the famous Lizzie Borden murder case of some four decades back. In it Lillian Gish undertook to portray the notorious paricide but with only indifferent success. Even worse fortune attended an anglicized, refurbished German version of John Gay's 18th Century classic, *The Beggar's Opera*, called in this instance *The 5-Penny Opera*.

But two more new plays worthy of inclusion in the record and one notable revival were staged before the inglorious season of 1932-33 limped haltingly to its close. Edouard Bourdet, the

French dramatist whose works heretofore have usually depicted some form of human perversion, was represented by an amusing farce-comedy, *Best Sellers*, an English adaptation of his *Vient de Paraître*, giving a humorous aspect to the competition for the Parisian equivalent of the American Pulitzer Prize for fiction. Ernest Truex and Peggy Wood competently handled the principal rôles. The Theatre Guild fulfilled its schedule by resurrecting an Italian item that had failed in New York some ten years earlier—Luigi Chiarelli's *The Mask and the Face*, now in a new adaptation by Somerset Maugham. Even with creditable acting by Judith Anderson, Stanley Ridges, and Leo G. Carroll to recommend it, the piece accomplished little more than keeping faith with the Guild's subscribers. But the Players Club scored the greatest popular success of its career as producer of a series of annual revivals with *Uncle Tom's Cabin*, presented interestingly and in all seriousness by a particularly notable cast which included Otis Skinner as Uncle Tom, Fay Bainter as Topsy, Elizabeth Risdon as Eliza, Thomas Chalmers as Simon Legree, and, in the minor parts, Cecilia Loftus, Pedro de Cordoba, Ernest Glendinning, Minnie Dupree, Lois Shore, Sylvia Field, John Daly Murphy, Edward MacNamara, Gene Lockhart, and the veteran Kate Mayhew. Announced, as usual, for only a single week, public demand extended its run to three, ending the season on at least a pleasant memory.

From then until well past mid-August the theatre, in so far as the metropolis was concerned, remained in a virtual state of coma. The summer playhouses in the various resorts and outlying districts were, however, more numerous and busier than ever, dividing their attention fairly evenly between stock presentations of recent successes, often with a visiting star, and test productions of new works, of which a surprisingly small number had reached the professional stage in New York up to the close of the year.

The new season finally began to bestir itself when, on August 23, William A. Brady again, as in 1932, set the ball rolling by importing from London Ivor Novello's comedy, *Party*, to which title Mr. Brady prefixed the article A, with the object, or so it was reported, of capturing first place in the alphabetical theatrical advertising columns. Though something of a hit at home, the piece lasted but five weeks when transplanted, despite the producer's astuteness in enlisting Mrs. Patrick Campbell for its central rôle, a character supposed to represent that lady herself, albeit taken in London by another actress. This circumstance proved to be the chief claim of *A Party* to distinction, though the presence of Cecilia Loftus with an opportunity to revive her gift of mimicry was a pleasant feature. For its first three weeks this piece had the field of novelty all to itself as the only new offering worth consideration, but toward the middle of September a couple of rivals entered the lists—*Murder at the Vanities*, a not too happy blend by Rufus King and Earl Carroll of two seemingly unmixable ingredients, the mystery melodrama and the pictorial musical revue; and a straight western melodrama, *Heat Lightning*, written by one Leon Abrams, doctored and staged by George Abbott, which was one of the few survivors of the summer try-outs. The former piece, presumably by virtue of the *Vanities* element, lasted the year out; the latter met with no such good fortune, notwithstanding interesting

performances by Jean Dixon and Robert Gleckler.

By this time new plays were appearing in rapid succession and a marked improvement in their quality was detectible. One of the earlier was *Double Door*, by Elizabeth McFadden, also a melodrama and based, somewhat freely, on certain sensational phases of the life of the now famous Wendel family of Fifth Avenue. This, too, had passed muster in the summer theatres and, largely through the excellent and uncompromising portrayal by Mary Morris of a bitter and unscrupulous spinster, continued on beyond the end of the year. Fate was rather less kind, however, to the new "Joe Cook show," *Hold Your Horses*, a piece cut to the measure of that amusing person but depending for its fun largely upon his latest set of absurd mechanical devices. A still more decisive turn for the better was marked by *Men in White*, written by Sidney S. Kingsley and produced by the Group Theatre in association with another management. The piece concerned itself with phases of life in a large metropolitan hospital and particularly with the exacting demands made by the medical profession upon its younger members as well as the temptations to which they are subject. The play was admirably acted, especial credit going to Alexander Kirkland and J. Edward Bromberg as junior and senior surgeons, respectively.

The first of two propagandist works on the Nazi theme to fail summarily was *Kultur*, an adaptation from the German, which was later followed by one entitled *Birthright*. Quite the reverse was the lot of an hilarious, ribald, salty farce by Kenyon Nicholson and Charles Robinson, *Sailor, Beware!*, portraying the romantic side of Navy life in the tropics, which New York took straight to its heart. Then followed what seemed likely, up to the end of the year, to rank as the bright particular musical hit of the season, a revue boasting a book by Moss Hart and score by Irving Berlin, *As Thousands Cheer*. Its formidable roster of entertainers was headed by Clifton Webb, Marilyn Miller, Helen Broderick, and the dusky Ethel Waters, a combination of talent that bade fair to equal, if not surpass, the success achieved two years previously by *Of Thee I Sing*, the first musical comedy ever to be awarded the Pulitzer Prize. Incidentally, the authors of that hit, Messrs. Kaufman, Ryskind, and the two Gershwins, at about this time themselves attempted to duplicate their greatest triumph by offering a sequel with the same chief characters and the same people to play them. This was called *Let 'Em Eat Cake* but, though highly diverting, failed to come anywhere near the goal of its ambition.

The Theatre Guild opened what gave every indication of being a banner season with an altogether delightful domestic comedy, Eugene O'Neill's *Ah, Wilderness!*, disclosing that usually militant playwright in an uncharacteristic but eminently becoming and very welcome, even if only temporary, benign and gentle mood with no more serious problems than those of adolescence demanding solution. George M. Cohan, drafted for the rôle of a sympathetic and understanding father in the piece, gave one of the most ingratiating and mellow performances of his career, ably and engagingly seconded by Elisha Cook, Jr., as his son. The production quickly attained the status of an outstanding success. Next on the Guild's schedule came an entirely new adaptation of Molière's *The School for Husbands* by Lawrence Langner, of the Guild's own forces, and Arthur

"MARY OF SCOTLAND"

Helen Hayes as Mary and Philip Merivale as the Earl of Bothwell

Guiterman, who reset the old French classic into English rhymed couplets. The innovations included the introduction of appropriate songs and music and the interpolation of a ballet lifted bodily from another work of the same dramatist. The result was distinctly pleasing and enjoyed considerable prosperity. To Osgood Perkins fell the leading part, originally taken by Molière himself, and June Walker and Flora Le Breton contributed further enjoyable elements. Then, at the beginning of December, the Guild staged Maxwell Anderson's newest poetic historical drama, *Mary of Scotland*, which promptly took rank as a more than worthy successor to his *Elizabeth the Queen* of a few seasons back, and won high credit for author, producers, and players. Helen Hayes portrayed the title part with exceptional distinction, Helen Menken was an admirable Elizabeth, and Philip Merivale presented an impressively romantic figure in the possibly somewhat idealized rôle of the Earl of Bothwell. As the year closed, the Guild had all three of these offerings running concurrently and a fourth in active preparation.

That cleverly original and sparkingly whimsical playwright, Clare Kummer, emerged after a long silence with two new works, one a negligible bit, *Amourette*, that fell far short of its author's standard and was speedily shelved; the other an excellent example of her best and most scintillating style entitled *Her Master's Voice*. This instantly caught the public fancy and was ranked among the year's bright spots, profiting considerably from uncommonly astute casting, such exactly right players for the matter in hand as Roland Young, Laura Hope Crews, and Elizabeth Patterson having been retrieved from Hollywood for the occasion. Lawrence Langner, already mentioned in connection with the Molière work, was quite as busy outside the Guild as within, and brought to the regular stage two offerings previously tested out in his own summer theatre in Connecticut. The first was an intentionally rakish trifle written by himself and Mrs. Langner, entitled *The Pursuit of Happiness*, set in Revolutionary days and concerning itself with the comic possibilities of the old Colonial practice of "bundling" as an incident of courtship. Its most notable result was the bringing into prominence of a pleasing and welcome new, youthful leading man, Tonio Selwart, of foreign birth but American by adoption. The other Langner offering was a new version of the periodically recurrent light opera of Johann Strauss, *Die Fledermaus*, known in this latest revival as *Champagne, Sec*, with its sketchy plot and familiar airs competently handled by Peggy Wood, Helen Ford, and George Meader.

A hit of the preceding London season, *Ten Minute Alibi*, a play of murder without mystery, made considerable progress toward duplicating its English record. The same was equally true of another British importation, *The Green Bay Tree* by Mordaunt Shairp, a serious, thoughtful work depicting the baleful effect on human character of a life of too much ease and luxury, finely played by James Dale, Laurence Olivier, Jill Esmond, O. P. Heggie, and Leo G. Carroll. But then followed a succession of offerings that met with but moderate favor if any at all—*Spring in Autumn*, an adaptation from the Spanish featuring Blanche Yurka; *The World Waits*, a melodrama of South Polar exploration with an all-male cast including Blaine Corder, Reed Brown, Jr., and Donald Gallaher; *Three and One*, an unsavory bit from

the French of Denys Amiel; *The Divine Drudge*, a dramatization by Vicki Baum, with the assistance of John Golden, of her novel, *And Life Goes On*; a nautical melodrama of mutiny on the high seas, *Eight Bells*, a success in London; a stage version of Christopher Morley's fantastic story, *Thunder on the Left*; a somewhat too strong-scented "horsey" melodrama called *Thoroughbred*, with Florence Reed as featured player; something from the Polish entitled *Doctor Monica* with a cast consisting entirely of three women, headed by Alla Nazimova; Lennox Robinson's latest comedy of Irish whimsy, *Is Life Worth Living?*; and another fairly recent product of the French stage, *I Was Waiting for You*. This lengthy sequence of mediocrity and bad luck was finally broken in mid-November by a musical comedy, *Roberta*, based on Alice Duer Miller's story, *Gowns by Roberta*, with a score by Jerome Kern. For this event the veteran Fay Templeton was once more lured from retirement to take the title rôle. The other chief entertainers were Tamara, Bob Hope, and Lyda Roberti.

Next came an even more striking comedy triumph in *She Loves Me Not*, Howard Lindsay's dramatization of Edward Hope's hilarious story of the same name—one of those rapid-fire pieces demanding special and original stage effects to insure speed and continuity in its complicated and highly mirth-provoking action. Herein John Beal, Polly Walters, Burgess Meredith, Charles D. Brown, and Jane Buchanan were outstanding among those amusingly involved. Then *The Dark Tower*, a sophisticated mystery melodrama resulting from the collaboration of George S. Kaufman and Alexander Woolcott, differing from the general run of its type in that the spectators, though seeing the murder committed in full view, are nevertheless treated to a complete surprise. Important contributions to the moderate success of this offering were made by Basil Sydney, Ernest Milton, William Harrigan, Margalo Gillmore, Margaret Dale, and Margaret Hamilton.

A stage version by Jack Kirkland of Erskine Caldwell's gruesome novel, *Tobacco Road*, brought new histrionic honors to the normally debonair Henry Hull for his merciless and uncompromising portrayal of a degraded, repulsive specimen of Georgia's "poor white trash." The opportunities for self-effacing acting of which he and several other members of the company availed themselves were about the only claims of the piece to a place in the theatre. A rather labored comedy of the Parisian "Left Bank" by the S. J. Perelmans entitled *All Good Americans* supplied limited facilities, but a fair amount of smart and witty dialogue, to Hope Williams and Fred Keating. Just before Christmas Owen Davis' long-heralded dramatic romance of the old South, *Jezabel*, finally reached the stage with Miriam Hopkins in the rôle for which Tallulah Bankhead had been sought, secured and, through illness, lost. Miss Hopkins was found quite equal to its requirements but the play itself failed to rise to expectations. A somewhat similar verdict greeted the American production of a London hit, *The Lake*, by the late Dorothy Massingham and Murray MacDonald, in which Katharine Hepburn, the young actress who, after a very brief experience on the stage, attained rapid and extraordinary popularity on the screen, returned prematurely to the theatre in the capacity of a star. The play contained a symbolic and tragic significance, not too clearly developed, that proved to be beyond Miss Hepburn's limited

range. Associated with her in the production were such capable and talented players as Colin Clive, with whom she had also appeared in at least one screen presentation, Frances Starr, and Blanche Bates, both of whom were lured from retirement for the occasion. Thanks, in large part, to the personal following of the cast, the offering seemed destined to enjoy a reasonable degree of success.

At Holiday time also Cornelia Otis Skinner introduced her new and interesting sequence of historical character sketches, *The Loves of Charles II*. The year in New York closed, however, on an indication of the fallibility of even the most experienced judgment. After many years of inactivity as producer, the veteran Daniel Frohman brought out an English version of a work that had achieved exceptional favor in the Yiddish theatre, *Yoske Kalb*, a folk-play dramatized from a novel and done in its native tongue by Maurice Schwartz. Its career in its new medium ended with the third performance.

EUROPE. In Great Britain, meanwhile, London of course remained the active producing centre, though the habit of sending metropolitan successes on tour through the outlying towns and provinces was becoming less and less prevalent, the custom being largely supplanted by a corresponding increase in the number of local professional repertory companies and amateur "little theatre" organizations. Frequently these groups were responsible for productions, particularly first showings, of considerably greater significance than those originating in London. Another especially noticeable tendency throughout the year was the constant interchange of dramas between England and America, although the fact that a play had met with high favor in one country gave no assurance whatever that it would do so in the other. Numerous instances of this uncertainty have already been noted in the foregoing record of the theatre in New York. But among the importations from the States were several that did manage virtually to duplicate their American success—the Kaufman-Ferber hit of the preceding year, *Dinner at Eight*, Rachel Crothers' *When Ladies Meet*, with Marie Tempest and Mary Newcomb in leading rôles, and *Music in the Air*, featuring Mary Ellis. *The Late Christopher Bean* was not in quite the same category for, though a great favorite on both sides of the Atlantic, two distinct versions of René Fauchois' original French comedy were used. Other American works seen in London during the year were *Once in a Lifetime*, *This One Man*, *Gay Divorce*, with Fred Astaire and Claire Luce, and a revamping of the old farce, *Ladies' Night*; also Eugene O'Neill's *All God's Chillun Got Wings*, with Paul Robeson.

The home products of the British metropolis included several new light comedies by the actor-playwright, Ivor Novello—*Fresh Fields*, *Flies in the Sun*, and the highly entertaining *Sunshine Sisters*; Hugh Walpole's first original drama, *The Young Huntress*; a showy piece by E. P. Montgomery entitled *Double Harness*; and a serious work by John Drinkwater, *Laying the Devil*. Lennox Robinson's broadly satirical *Drama at Innish* attracted sufficient favor in a trial presentation to warrant a regular production later under the title *Is Life Worth Living?*, and enjoyed considerable popularity in London yet failed utterly in New York. Two other plays which emerged from the experimental state into substantial successes were *The Lake* and *Richard of Bordeaux*, the latter an historical drama by one

Gordon Daviot (a pseudonym) that proved to be the outstanding hit of the year and firmly established its leading player, John Gielgud, in the regard of the British public. There were also at least two plays dealing biographically with the Brontë sisters—one, by Alfred Sangster, entitled simply *The Brontës*; the other, by Clemence Dane, *Wild Decembers*, in which Diana Wynyard scored a triumph as Charlotte. Still another historical biographical drama, Ronald Gow's *Gallows Glorious*, on an American subject, won favorable attention in London though destined later to fail summarily in New York under the name of its central figure, *John Brown*. A distinctly artistic work based on an authentic episode in the life of Francis Thompson, poet, was a pleasant medium for Ernest Milton, who also appeared to picturesque advantage in *Night's Candles*, Grant Yalis' adaptation of Alfred de Musset's Florentine item, *Lorenzaccio*. Keith Winter's dramatization of his own novel, *The Rats of Norway*, provided an effective, yet grim and forbidding, vehicle for Gladys Cooper and Raymond Massey.

During the summer, attention focused on the customary dramatic festivals at Canterbury and at Malvern, where, as the modern example with which to close his survey of the history of the English theatre, Sir Barry Jackson introduced James Bridie's latest work, *A Sleeping Clergyman*, creating sufficient interest to warrant a regular production shortly thereafter. The new season disclosed also John van Druten's *The Distaff Side*, the cast of which included Sybil Thorndike and Haidee Wright, and the satirical *Sheppey*, announced by Somerset Maugham as his final play. A near-riot of anti-Hitler sentiment was precipitated by the first personal appearance in the British capital of the German screen actor, Werner Krauss, who nevertheless displayed unsuspected power in a production of Hauptmann's *Before Sunset*. Sir John Martin Harvey contributed an admirable type of romantic acting in his revival of Irving's old favorite, *The Bells*. Then, in October, came the strikingly novel musical entertainment, *Nymph Errant*, adapted from a story by James Laver, which might be described as a politely amusing feminine version of Anatol's "affairs," and which formed an excellent medium for a skillful performance by Gertrude Lawrence. The flair for plays biographical continued with Talbot Jennings' *This Side Idolatry*, an imaginative study of Shakespeare, with Leslie Howard as the Bard and Margaret Rawlings as the Dark Lady; also an unimportant drama by Elswyth Thane dealing with the youth of Shakespeare's equally famous contemporary, Elizabeth of England. A play of medical student life in Edinburgh, *The Wind and the Rain*, the work of a physician, Dr. Merton Hodge, was favorably received. The Charlott revue, *Please*, succeeded in living up to its title as a vehicle for the comic gifts of Beatrice Lillie and the antics of Lupino Lane. Late in the Fall London witnessed the world première of Robert E. Sherwood's *Acropolis*, another piece in that playwright's familiar idiom, the amusingly incongruous blend of antiquity and modernity, which failed, however, to catch the popular fancy.

December added several items of more or less note and varying prospects of success, starting with Bernard Shaw's latest political animadversion, *On the Rocks*, a lengthy and characteristically discursive, but quite entertaining, opus on dictatorship, with scene laid in Downing Street. J. B. Priestley's new piece, *Laburnum Grove*,

leaned rather heavily on a particularly ingenious last act. An English adaptation by R. C. Trevelyan of Melchior Lengyel's *Angel* likewise disclosed various uncommon features though suffering from over-insistence on the idea of make-believe. Another German film star, Elisabeth Bergner, brought extraordinary vitality, eloquence, and resourcefulness to the living stage by appearing in *Escape Me Never*, Margaret Kennedy's continuation of her saga of the Sanger family. The year in London may be said to have closed on a brilliant performance by Marie Tempest, approaching 70 but still going strong, in H. M. Harwood's comedy, *The Old Folks at Home*.

Paris witnessed during 1933 new plays by most of the active native dramatists of the day, with the notable exception of Marcel Pagnol, the French master of the long run. In addition, several comparatively new writers for the stage came into prominence, among them Yvan Noe with two items to his credit, one with an English title, *Teddy and Partner*, the other, *Monsieur Le Comte*, with English characters. Alfred Savoir's contributions were *La Voie Lactee*, whose chief figure was regarded as a sketchy portrait of Sacha Guitry, and *Maria*, a return to the old-time "problem" type. The prolific Guitry himself turned out a variety of novelties—*Châteaux en Espagne*, in which he also acted and with him Jacqueline Delubac, making her début as the successor of Yvonne Printemps; *Un Tour au Paradis*, written for Victor Boucher; a play with music, *Florestan I, Prince of Monaco*; a Biblical piece and several minor items. Marcel Achard was responsible for both *The Woman in White* and *Petrus*; Henri Bernstein for *Bonheur*, an excellent example of his mastery of theatrical technique, in which Mlle. Printemps took the leading part, and *Le Messager*; Henri Duvernois for *Maison des Confidences*. Jacques Deval provided the French version of the American hit, *Dinner at Eight*, besides two original pieces, the cynical *Prière pour les Vivants* and *Tovaritch*. Other plays of comparative importance were *Une Poule sur un Mur* by Leopold Marchand, Jean Giraudoux' very charming *Intermezzo*, a rhapsodic piece by Paul Raynal entitled *Francerie*, Andre Obey's symbolic *Loire, Le Paradis Perdu* by Paul Gavault, Maurice Rostand's *Les Marchands de Canons*, Steve Passeur's notably vital *L'Amour Gai*, J. J. Bernard's *Jeanne de Pantin*, and French versions of the British *Payment Deferred* and the American *Abie's Irish Rose*, the latter under the name *Bloch de Chicago*. To these may be added an appreciable sprinkling of musical comedies, including a couple based on the lives of well-known composers—Offenbach for one, the other concerned with the two Johanns Strauss, father and son.

The German stage during 1933 underwent a considerable transformation upon the rise to power of the Nazi element. As a phase of Hitler's anti-Semitic campaign, the directors of the leading producing theatres in Berlin, practically all of them Jews, were cased out or forced out of their positions and supplanted by a personnel more to the liking of the régime. Thereafter an edict went forth indicating the type of dramatic presentations which would accord with the principles it was purposed to inculcate. But even prior to these developments Berlin had lost much of its prestige as a theatrical centre and productions of a more generally satisfying character were being found in the smaller cities. As early as February about

all that was left of the capital's vanishing glory was a scattering of musical offerings, such as Paul Abraham's *Ball at the Savoy*, a notable revival of Offenbach's *Princess of Trapezunt*, and *Frühlingstürme* by the Czech composer, Weinberger, in which Richard Tauber undertook to sustain the Viennese tradition. Subsequently another, *La Vallieri*, marked the operatic début in Germany of Louis Graveure. At about the same time, a well-known criminal lawyer named Alsberg turned playwright and gave the world a drama dealing with legal professional ethics entitled *Conflict*. Then, as the closing feature of his activities in Berlin, Prof. Max Reinhardt staged elaborately Hugo von Hoffmannsthal's *Grosses Welttheater*, from the Spanish of Calderon. Similarly Barnowsky, dean of the capital's notable directors, presented Franz Arnold's comedy, *Da Stimmt Was Nicht*, as his swan song.

Under the new order one of the more important offerings was Hanns Johst's *Schlageter*. The public, however, did not too readily accept the Nazi domination of the theatre and by late summer the change of sentiment had resulted in at least a temporary return to type with Gregor Schmitt's comedy, *Don Juan's Raincoat*. It was after this that a more determined effort was made by the Hitler forces to color the output of the theatre industry. The results were none too happy, but in the fall an uncommonly charming operetta appeared in *Bezauberndes Fraulein*, with book and music both by Ralph Benatzky. Still later, encouragement was given to revivals of Schiller as conforming to regulations. Munich, rather than Berlin, saw the première of a new work by Hauptmann, *The Golden Harp*, which nevertheless proved to be of little importance.

In Vienna one of the outstanding events of the year in the theatre was Fritz Kreisler's operetta, *Sissy*, the central figure of which was the late Empress Elizabeth. Its score, however, was only partially new for into it the composer worked several of his familiar and long-popular airs. An apparent taste for the biographical was further evidenced by Sil Vara's charming comedy of England's Victoria, *The Girlhood of a Queen*. Budapest, in its turn, produced in the fall two new plays representative of Hungarian drama in its most felicitous latter-day form—Otto Indig's *The Man Under the Bridge* and Istvan Zagon's *The Land of Promise*. Meanwhile both the Scandinavian capitals turned to America for the chief of their novelties, offering translations or adaptations of Eugene O'Neill's *Mourning Becomes Eleoira* and the older *Desire Under the Elms*, this being the first production of the former in Europe, and of the Kaufman-Ferber *Dinner at Eight*.

DREAMS. See PSYCHICAL RESEARCH.

DUCA, ION GHORGHE. A Rumanian statesman, died by assassination at Sinaia, Dec. 29, 1933. Born at Craiova, near Bucharest, in 1879, he attended the Universities of Bucharest and Paris, receiving the LL.D. degree from the latter institution. At the time he was studying in Paris, he contributed to *Universal*, a Bucharest newspaper, a sensational series of foreign comment articles. Elected to the Chamber of Deputies in 1907, he interested himself in the coöperative movement among the Rumanian peasantry, instituting communal purchase of farm machinery and marketing of crops. Under Ionel Bratianu he served as Minister of Education during 1914-18, and as Minister of Agriculture in the Coalition Cabinet of 1918. While holding the latter port-

folio he instituted the agrarian reforms by which there were later expropriated and divided among the peasantry landed estates of more than 500 hectares in the old kingdom of Rumania and of more than 100 hectares in Bessarabia, Transylvania, and Bukowina.

As Minister of Foreign Affairs in the Bratianu cabinet of 1922-27, Dr. Duca attended various League of Nations' meetings and the Lausanne conference of 1923 at which drastic revision was made of the whole Near East Settlement as registered in the Treaty of Sèvres. He originated also the periodical conferences of the Little Entente (composed of Czechoslovakia, Rumania, Yugoslavia, and, on occasions, Poland) for the discussion of their mutual interests. He was appointed Minister of the Interior in the Ionel Bratianu cabinet of 1927 and retained the same post under Vintila Bratianu in 1928.

Upon Vintila Bratianu's death in 1930, Dr. Duca assumed the leadership of the Liberal party, and on Nov. 12, 1933, became Premier of Rumania. His assassination was instigated by leaders of the Iron Guard, a Fascist and anti-Semitic organization, who hated him for his tolerant attitude toward the Jews and his defense of Liberalism in the face of the on-sweeping tide of Fascism and Communism. The organization had recently been suppressed.

DUKE UNIVERSITY. An institution of higher education in Durham, N. C., affiliated with the Methodist Episcopal Church, South. Having its origin as York Academy in 1835, it was expanded in 1858 into Trinity College and in 1924, through benefactions from James B. Duke, into Duke University. The enrollment for the autumn of 1933 was 2840. The faculty numbered 258. The endowment funds amounted to approximately \$23,334,000. The library contained approximately 350,000 volumes. President, William Preston Few, Ph.D., LL.D., Litt.D.

DUNKIRK. See PORTS AND HARBORS.

DUNWOODY, BRIG.-GEN. HENRY HARRISON CHASE, U.S.A., RET. An American soldier and meteorologist, died in Interlaken, N. Y., Jan. 1, 1933. Born in Highland Co., O., Oct. 23, 1842, he attended the United States Military Academy and on his graduation in 1866 served for three years as lieutenant with the 4th Artillery of the United States Army. He then became recorder for the Tactics Board in St. Louis, Mo. In 1872 he was appointed meteorologist with the Signal Corps office in Washington, directing for nearly 20 years the observation and prediction of storms, river floods, excessive heat or cold, and destructive winds. He also systematized these official forecasts for the benefit of agriculture, commerce, and navigation, published after 1875 a daily weather map of the Northern Hemisphere, and promoted the establishment of weather services in the various States.

On the transfer of the Weather Bureau to the Department of Agriculture in 1890 Dunwoody was commissioned major in recognition of these services. He served during the Spanish-American War as chief signal officer, with the rank of colonel, and previous to his retirement in 1904 was commissioned brigadier-general. His papers on meteorological subjects include: *Decrease of Temperature with Elevation and Reduction of Barometer to Sea Level; Tables of Rainfall and Temperature Compared with Crop Production; Weather Proverbs; Absolute Humidity and Mean*

Cloudiness in the United States, and Geographical Distribution of Rainfall in the United States.

DYNAMO ELECTRICAL MACHINERY. The business of manufacturing electrical machinery suffered a considerable decrease in 1932 but by the end of 1933 had recovered until it reached a point 31 per cent above 1932 and about 65 per cent of the peak figures for 1929 and 115 per cent of the 1923-25 average. The American Standards Association issued the first report on Standards for Electrical Rotating Machinery. The report includes standards for direct current rotating machines; synchronous generators; motors and converters, induction motors and a.c. and d.c. fractional horse power motors. It is based on the standards of the American Institute of Electrical Engineers and the National Electrical Manufacturers Association representing both the users and makers of electrical apparatus.

One new turbo generator broke the record for size this year, rated at 183,333 kv-a., 90 per cent power factor or 165,000 kw. operating at 188 r.p.m. to be used in Philadelphia and the water-wheel driven generator under construction for Boulder Dam will break the record for size in this class. Four have been ordered, each rated at 82,500 kw. at 180 r.p.m., from two different companies, General Electric and Westinghouse Co. In Chicago there was put into operation a 100,000 kv-a. bank of "Phase Shifting" transformers for tying together two power systems and regulating the flow of power between them.

An unusual piece of apparatus was a 3-phase generator of 60 kv-a. for a frequency of 4800 cycles for operating induction furnaces in metallurgical work.

A new type of synchronous motor is able to start with a heavy load, pull into synchronous speed and establish its own field excitation automatically at the proper instant. Some are capable of operating at either of two speeds such as 600 or 900 r.p.m. This is accomplished by dividing the stator or primary winding into several circuits from which various combinations are made and by putting on the rotor or secondary both a squirrel cage and a definite wound induction motor winding. The rotor excitation in the definite winding is made at a definite slip frequency by automatic devices.

Enclosed motors have come into more general use because of the increased use of individual drive in exposed places, such as the decks of ships and shops where there is much dust or explosive fumes. There are several types, "Splash," "Weather," and "Explosion" proof, the latter particularly for oil refineries. Synchronous motors are now built of the enclosed type if desired.

Many mercury arc rectifiers of 3000 kw. capacity for railway work at 625 volts were installed this year. There are two forms in vogue; one of a single rectifier tank for the whole power and another of a combination of four 750 kw. tanks assembled in an interchangeable standardized set-up.

A new and much simpler device has been de-

veloped and put into service for balancing motors to prevent vibration. By this means the rotating part of any electric machine may be balanced in a few minutes whereas a few years ago it required many trials and much time.

Improvements have been made in Single Phase Motors using the capacitor start and capacitor run combinations largely on account of the improved quality and lower price of capacitors. These motors are largely used for domestic refrigerators.

DYSENTERY. See **MEDICINE AND SURGERY.**

EARTHQUAKES. On the average, earthquakes are felt in some part of the world at least 4000 times each year, though fortunately the vast majority of them are either feeble and harmless, or else occur under the sea or in thinly populated regions. In the United States alone, 200 or more are usually reported annually.

On Dec. 25, 1932, a severe earthquake occurred in the Kaotai District, Kansu Province, of China. Within a few hours after the earthquake, eight seismological stations in widely separated parts of the world transmitted the data recorded by their instruments to the scientific world. However, because of the lack of telegraphic and other news facilities in the Kansu Province, direct news of the damage done by the quake did not reach the outside world until late in January, 1933. This earthquake and the floods which followed it caused the deaths of 70,000 people.

Severe earthquake shocks, followed by sea waves caused great damage in the northern part of the Island of Honshu, Japan, and adjacent islands on March 3. About 1500 people were killed. This was apparently a submarine earthquake, whose focus was in the Japan deep. The sea wave was recorded as far away as San Francisco.

An earthquake which did great damage in various towns and cities was felt in southern California on March 10. The epicentre was at sea and the land area affected was about 450 square miles. The earthquake was of about the same intensity as the Santa Barbara quake of 1925. The disastrous consequences of the shock were due mainly to poor construction on bad ground in a somewhat thickly populated district. About \$41,000,000 worth of property was wrecked and 130 people lost their lives. This was the only earthquake in the United States during the year which killed any people.

About 100 people were killed by a severe earthquake on the Island of Kos, Aegean Sea, on Apr. 23, 1933. The west coast of Sumatra was shaken by a quake on June 26, which killed 70 natives near Benkoelen. Three people were killed in an earthquake which struck Tegucigalpa, Honduras, during the night of July 4.

Twenty people were killed and several injured in a sharp earthquake that struck the village of Tchivrii in Turkey on July 20. This shock was also felt, but without damage, at Denizli.

On August 25, a heavy earthquake took place in the region of Chengtu in the Szechwan province of China. Its epicentre was located immediately by seismologists, but similar to the earthquake in the Kansu Province mentioned above, it was five days later before cable reports confirmed the information of seismological sources and announced that about 100 people were killed.

A severe earthquake was felt along the Noto Peninsula of Japan on September 21, being most strongly felt at Nanao. One person was killed and several seriously injured. This shock was per-

ceptible for three minutes at Kanazawa. In the early morning of September 26, an earthquake occurred which damaged many homes in the Abruzzi Mountain region in Italy and caused the death of 16 and injury of about 200 people. This was followed by another shock, less severe, but which caused many houses, already weakened, to collapse, on September 28, and still another on September 29.

A very violent earthquake occurred in Baffin Bay on November 20. Its tremors, traveling for thousands of miles, reported its occurrence through hundreds of seismograph instruments all over the earth. This was the only source of news about this earthquake, for the region is uninhabited, so that there could be no cabled or radioed reports of people killed and the works of man laid in ruins. This quake was extraordinary not only for its violence but also for its location: no major earthquakes had ever before been recorded in the Baffin Bay region. See **SEISMOLOGY.**

EAST PRUSSIA. A Province of the German state of Prussia from which it is geographically separated by the Polish Corridor. Total area, 15,061 square miles; total population, June 16, 1933, 2,356,938. See **GERMANY** and **POLAND** under *History.*

ECOLOGY. See **BOTANY.**

ECONOMIC ASSOCIATION, AMERICAN. An organization founded at Saratoga, N. Y., in 1885 to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life, to issue publications on economic subjects, and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership in 1933 totaled approximately 3500. The annual meeting of the association was held in Philadelphia, Pa., Dec. 27-29, 1933. Among the topics discussed were: "The History of the Recovery"; "Imperfect Competition"; "Public Utilities in the Depression"; "The Transportation Problem"; "Marketing under Recovery Legislation"; "Economics of the Recovery Act"; "Measurement of Unemployment"; "Banking and Monetary Legislation"; "The Rehabilitation of Agriculture"; "Public Finance"; and "Unemployment and Public Works." The official journal is the *American Economic Review*, a quarterly. The officers in 1933 were: President, William Z. Ripley, Harvard University; vice-presidents, Abbott Payson Usher, Harvard University, and Walter W. Stewart, New York City; counsel, John E. Walker, Washington, D. C.; and secretary and treasurer, Frederick S. Deibler, Northwestern University.

ECONOMIC CONFERENCE, WORLD. The World Monetary and Economic Conference met at London, June 12, 1933, and recessed for an indefinite period on July 27. Its object was to secure international agreement and coöperation in financial and economic measures designed to check and banish the world economic depression. The only concrete results of the conference were agreements between certain nations producing large quantities of silver and wheat which were calculated to raise the price of these commodities. Upon the most important issues confronting the assembled delegates—currency stabilization, tariff reduction, price-raising schemes—no agreement proved possible, due in large part to developments in the United States. The signal failure of

the gathering to achieve its major objectives, coupled with distinct evidence of a world economic revival in spite of this failure, increased the trend toward economic nationalism.

PREPARATIONS FOR CONFERENCE. Proposals for an international attack upon the depression failed to receive serious consideration until more than two years after the beginning of the economic crisis. Each nation sought by domestic legislation and action to check price declines, the general stagnation of business, and the steady increase in unemployment. It gradually became evident, however, that the uncorrelated measures of the various countries were intensifying, instead of ameliorating, the depression. The Young Plan Advisory Committee, issued from Basle, Switzerland, on Dec. 23, 1931, an urgent plea for international action. It declared the problem had "assumed a world-wide range" and threatened "a profound change in the economic relations of nations to one another."

On the initiative of Great Britain, the European governments held a conference at Lausanne, Switzerland, from June 16 to July 8, 1932, and provisionally settled the reparations issue (see 1932 YEAR BOOK under *Reparations and War Debts*). Efforts to include war debts and other problems related to the world depression in a general settlement at Lausanne had been frustrated by the refusal of the United States government to participate on that basis. Accordingly the Lausanne Conference provided for the holding of a separate world economic and financial conference. The United States on May 31, 1932, agreed to participate in the World Economic Conference "for the purpose of considering methods to stabilize world commodity prices." It stipulated that war debts, reparation and disarmament should not be discussed.

The Preparatory Commission of Experts met at Geneva from Oct. 31 to Nov. 9, 1932, and from Jan. 9, to 19, 1933, to draft an agenda for the London conference. No date for the conference was fixed, however, until Apr. 29, 1933, when the organizing committee in London convened it for June 12. The decision to call the conference immediately, despite the great difficulties in the way of an agreement revealed in the preliminary discussions of the Preparatory Commission, was due to two factors. Until the third quarter of March there had been a steady tightening of the depression, accentuated by the bank crisis in the United States. The prices of raw materials were less than one-half those of October, 1929. Wholesale commodity prices were about one-third less, in terms of gold. The universal decline in prices, wages, and national incomes, without a corresponding reduction in indebtedness, made it increasingly difficult to meet national and international obligations. The value of world trade was 60 per cent less than in 1929 and was still declining at a more rapid rate than during the first years of the depression. Production and employment statistics reflected a similar decline. The nations turned toward cooperation as a last resort to avoid complete collapse. Secondly, President Roosevelt had taken the initiative in inviting representatives of the various nations to Washington for preliminary discussion of the world economic situation. These conversations opened on April 21 with the arrival of the British Prime Minister, Ramsay MacDonald. Edouard Herriot of France, Prime Minister Bennett of Canada, Finance Minister Jung of Italy and

others followed. The apparent agreement on general policies reported in joint statements issued by President Roosevelt and his visitors encouraged the belief that the London conference would meet with some prospect of success.

The general policies agreed upon were (1) an increase in commodity price levels; (2) moderation of restrictions upon commerce; (3) concerted action by central banks to expand credit; (4) stimulation of private business by government capital expenditures; (5) ultimate stabilization of currencies; and (6) a higher price for silver.

DEVELOPMENTS IN THE UNITED STATES. Before the conference met, however, a business revival was well under way in the United States and in most of the other industrial countries. This lessened the pressure upon the governments to sacrifice their nationalistic economic programmes in the interests of an international revival. Moreover, the exigencies of the domestic economic and political situation in the United States made it increasingly difficult for the Roosevelt Administration to carry through the international policies to which it had previously given its general assent.

In addition to the business upturn, the developments in America which made an agreement impossible at London were: (1) the abandonment of the gold standard on April 19; (2) the inauguration by the government of a comprehensive programme for raising prices, increasing employment, and stimulating general business activity; (3) the disinclination of Congress to grant President Roosevelt authority to negotiate a settlement of the war debts or to reduce the tariff. Technical and other reasons made it inadvisable to stabilize the currency immediately after the gold backing was removed. Moreover a vital part of the Administration's recovery programme called for a rise in prices to approximately the 1926 level. Stabilization would have prevented the contemplated price rise. It would have hindered, if it did not completely frustrate, the recovery programme.

Tariff reduction while the recovery programme was in process of development threatened to have similar adverse results. An influx of cheap foreign goods would act as a brake upon the rise of domestic prices and the increase in domestic production, employment and consumption envisaged under the National Recovery Act. However, this incompatibility between the Administration's domestic and foreign policies apparently was not clearly recognized in Washington until about the time the conference convened.

PRELIMINARY DISCUSSIONS. Preliminary discussions on a number of issues took place in London among diplomatic representatives and experts before the conference met. The American government, through the efforts of Ambassador-at-large Norman Davis, secured the assent of Great Britain, Germany, Belgium, France, Italy, Japan, and Norway on May 12 to a tariff truce for the duration of the conference. Most of the other governments later adhered to this truce. Negotiations for an international wheat restriction agreement were begun by special delegates from the United States, Canada, Australia, and Argentina the week before the conference met, and were continued conjointly with the conference.

Preliminary discussions of the currency stabilization problem were also held in London by

financial experts of the respective delegations, but without result. The American experts—George L. Harrison of the New York Federal Reserve Bank, Prof. O. M. W. Sprague, and James Warburg—approved stabilization in principle but opposed it so long as it might check the rise in commodity prices in the United States. On June 2, the German government announced that the problem of transferring out of Germany the interest and amortization payments on German foreign debts would be placed before the conference. Meanwhile a moratorium on such payments was declared.

The American delegation to the conference was headed by Secretary of State Hull and included James M. Cox of Ohio, vice chairman; Senators Key Pittman of Nevada and James Couzens of Michigan, and Representatives Samuel D. MacReynolds of Tennessee and Ralph Morrison of Texas.

THE CONFERENCE OPENS. The conference was opened by Prime Minister MacDonald, as chairman. The chiefs of the various delegations followed him in making general statements of the attitudes of their governments toward the issues at hand. Although war debts were not listed on the agenda, Mr. MacDonald in his opening address said that this problem "must be dealt with before every obstacle to general recovery has been removed, and it must be taken up without delay by the nations concerned." The semi-annual installment on the war debts of the European governments to the United States came due June 15. With the token payments or outright defaults occurring on that date, the issue was temporarily eliminated from the conference arena. See REPARATIONS AND WAR DEBTS.

The opening addresses were not particularly illuminating or significant. Mr. Hull reiterated his demand for tariff reductions and the moderation of all forms of economic nationalism. Neville Chamberlain, British Chancellor of the Exchequer, said that Great Britain would not return to the gold standard until wholesale prices had risen, the war debt problem disposed of, and excessive tariff barriers lowered. To raise prices he suggested the expansion of central bank credit and a joint programme of public works. The French, with the support of other nations adhering to gold, demanded early stabilization of currencies and a return to the gold standard as early as possible.

On June 15 the Conference appointed commissions for a more detailed study of the various problems before it. The Economic Commission was headed by Dr. Hendrik Colijn, Prime Minister of Holland; the Monetary Commission by James M. Cox, vice chairman of the American delegation.

THE STABILIZATION ISSUE. The agenda of the conference consisted of the following six main topics: (1) Monetary and credit policy; (2) prices; (3) resumption of the movement of capital; (4) restrictions upon international trade; (5) tariff and treaty policy; (6) organization of production and trade. When the conference opened its attention was immediately riveted upon monetary and credit policy, despite efforts of Secretary Hull to deal first with the issue of tariff reductions. The French and other gold delegations desired the immediate stabilization of the dollar and the return of the United States to the gold standard. They feared continuance of the depreciation and fluctuation of

the dollar on international exchanges would force their countries off gold. The British, also, wanted the dollar at least temporarily stabilized to avoid adverse effects upon their own more stable pound.

Three days after the conference convened, it was reported that the governors of the central banks of the United States, France, and Great Britain had reached a provisional agreement for currency stabilization and that it involved the suspension for three months of the inflation legislation authorized by the U. S. Congress. These rumors caused the most severe decline on the New York stock and the commodity markets recorded since October, 1932.

Although President Roosevelt, in his message of May 16, had called for currency stabilization, he let it be known June 17 that the United States was not ready to approve the stabilization scheme of the central bankers. On the same day, Premier Daladier of France announced that France could not consider tariff reductions or any other efforts at economic collaboration until the dollar and the pound were stabilized. The French had previously insisted also upon a prior settlement of the war debt dispute. When Mr. Roosevelt's decision became known, less than a week after the conference met, the French and other gold delegations launched a campaign for immediate adjournment until the United States was ready to stabilize the dollar. They pointed out that without some form of stabilization, no progress on any other issue could be expected.

The American delegates vigorously opposed this argument, asserting that there was nothing to prevent discussion of other problems. On June 17 the Americans introduced four proposals for discussion by the Economic Commission. They called for: (1) A general horizontal cut of 10 per cent in import duties and modification of other import restrictions; (2) extension of the tariff truce following the conference; (3) bilateral tariff reductions based on the most-favored-nation principle; and (4) removal of restrictions upon the movement of foreign exchange. These proposals, which reflected the views of Secretary Hull, were repudiated the following day by Senator Pittman, who said they came from the experts and not the members of the American delegation.

The American delegates clarified their position on June 22 with two statements. One, dealing with monetary stabilization, said that the United States found the measures proposed in this direction "untimely." The other called for the early and complete removal of trade embargoes and quotas and the negotiation of bilateral or multilateral agreements to reduce tariffs. Meanwhile the exchange value of the dollar continued its downward spiral; and attacks upon the Dutch guilder, commencing June 27, increased the fear of the gold standard countries—the Netherlands, France, Belgium, Switzerland, and Italy—that their currencies would be dragged off gold by the dollar's depreciation. While demands for adjournment of the conference increased, the gold bloc obtained Great Britain's support of a move to halt speculation in dollars. With the approval of the American delegation and of Prof. Raymond Moley, Mr. Roosevelt's personal representative at London, the gold countries and Great Britain appealed to the President to join with them in issuing a declaration on monetary policy. The proposed declaration affirmed that the signa-

tories favored the gold standard and intended to return to it as soon as possible. It also pledged each country to assist the others in checking purely speculative currency fluctuations.

President Roosevelt's emphatic rejection of this proposal on July 3 nearly precipitated the complete collapse of the conference. He declared it would be a "catastrophe" if the conference allowed itself to be diverted from its major objectives by "the proposal of a purely artificial and temporary experiment affecting the monetary exchange of a few nations only. . . . The sound internal economic system of a nation is a greater factor in its well-being than the price of its currency in changing terms of the currencies of other nations." The bluntness as well as the content of the President's reply produced both perplexity and anger among the conference delegates and a closer unity among the gold countries, who took active measures to defend the gold standard. Only the tactful diplomacy of Secretary Hull prevented an immediate adjournment. Upon the insistence of the American, Canadian, Australian, British, Japanese, and other non-gold delegations, deliberations were continued. Little progress was made, however, and on July 14 the conference officials decided to adjourn temporarily on July 27. President Roosevelt's policy found its principal supporters in Prime Minister Bennett of Canada and General Smuts of South Africa, who attempted unsuccessfully to induce the British Chancellor of the Exchequer, Neville Chamberlain, to follow the American price-raising policy through depreciating the currency and expanding credit.

TARIFF PROPOSALS. Before the conference adjourned, Secretary Hull introduced (July 21) a resolution on tariffs for consideration during the conference recess. He proposed tariff reductions by bilateral or pluri-lateral negotiations, with reservations covering the emergency situation in the United States. His carefully worked out plan was intended to serve as a basis for a permanent tariff truce when and if the conference reconvened. It remained the general conviction that while currency stabilization was temporarily of predominant importance, the world's economic recovery in the long run was dependent upon the reduction of tariff barriers.

THE SILVER AGREEMENT. The sole concrete achievement of the conference was the agreement signed July 20 among the chief silver-producing and silver-consuming nations, intended to raise the price of the white metal. Under the plan, the governments of India, China, and Spain agreed that for four years they would limit their exports of silver to 40,000,000 fine ounces annually. The United States, Australia, Canada, Mexico, and Peru, the chief producing countries, agreed to export no silver whatever for four years and in addition to absorb in their currencies 35,000,000 ounces of silver annually for the same period. Senator Key Pittman was the chief proponent of the scheme.

THE WHEAT RESTRICTION PLAN. The first session of the World Wheat Conference was held in conjunction with the World Economic Conference, although the subject was not on the agenda of the larger conference. Representatives of 31 nations participated in the discussions. A second session convened August 21 in Canada House, London, and adjourned August 25 upon the signing of a complete plan embracing both wheat producing and consuming countries. The

exporting countries—United States, Canada, Australia, Argentina, Russia, and the Danubian States—agreed to limit their wheat exports for two years. The first four were to restrict their joint exports in 1933-34 to 560,000,000 bushels and to curtail the acreage devoted to production for export by 15 per cent in 1934-35. The Danubian countries undertook to restrict their exports to a maximum of 50,000,000 bushels annually, and the Soviet Union to a maximum to be determined later. In return for these commitments by the producers, the consuming countries agreed to reduce their tariffs on wheat as soon as the price of wheat had been maintained at 63.0 cents gold for four months. The importing countries also agreed to prevent increases in their domestic wheat production. A world carry-over of 950,000,000 bushels of wheat was the principal factor in inducing the nations to accept the restriction plan.

ECUADOR, ek'wà-dôr. A South American republic. Capital, Quito.

AREA AND POPULATION. The area of Ecuador is not definitely fixed, due to a boundary dispute with Peru. It was variously estimated at from 275,936 to 337,304 square miles, including the Galapagos or Colon Islands (2868 square miles), situated 600 miles west of Ecuador in the Pacific. The total population in 1931 was estimated at 2,500,000, with whites comprising about 10 per cent of the total; Indians, 38 per cent; mixed, 41 per cent; Negroes, 5 per cent; and others 6 per cent. The movement of population in 1931 was: Births, 99,325; deaths, 47,443; and marriages, 12,898. The population of the chief cities in 1932 were: Quito, about 104,000; Guayaquil, 120,000; Cuenca, 42,000; Riobamba, 21,200.

EDUCATION. Primary education is free and compulsory. In 1933, Ecuador had 1870 public elementary schools, with 133,090 pupils enrolled; 15 secondary schools, with 3403 pupils; and 4 public universities, with 1064 students. Private schools in the same year consisted of 288 elementary schools, with 30,095 pupils; and 3 secondary schools, with 260 pupils. The universities are Central University at Quito, Guayas University at Guayaquil, Azuay University in Cuenca, and the Law College at Loja.

PRODUCTION. About 90 per cent of the population is dependent upon agriculture for a livelihood, but mining is perhaps the chief export industry. The area under cultivation in 1932 was about 11,480,000 acres and the annual gross agricultural production was estimated at about 410,000,000 sucres (sucre equals 20 cents U. S. at par and exchanged at 17.73 cents in 1932). Cacao is the chief crop, although production had been reduced over a number of years by the witchbroom disease. Cacao production in 1931 was 28,318 metric tons. Other leading crops are coffee (18,380,000 pounds, 1931-32), rice (36,591,000

pounds in 1931), cotton (5,624,000 pounds in 1931-32), sugar (23,600 long tons in 1930-31), cereals, vegetables, fruit, etc. Livestock in 1931 included 1,290,000 cattle, 700,000 sheep and goats, 85,000 horses, and 200,000 swine. Wool production (1931) was about 1,450,500 pounds. The forests yield vegetable ivory, rubber, and kapok.

Exports of all mineral products in 1932 were valued at 22,628,085 sucres, including gasoline and crude petroleum. The petroleum output in 1932 was 1,597,000 barrels (1,762,000 barrels in 1931). Gold production in 1932 was 56,147 troy ounces; silver, 114,167 troy ounces. Copper, iron, lead, and coal also are mined. The chief manufacturing industries are the production of Panama hats, textiles, flour, sugar, alcoholic beverages, and chocolate.

COMMERCE. In 1932, imports were valued at 34,710,000 sucres and exports at 49,298,000 sucres, the favorable balance of trade being 14,588,000 sucres. This compared with 1931 imports of 44,076,000 sucres and exports of 56,660,000 sucres; with 1930 imports of 63,981,106 sucres and exports of 80,646,539 sucres. Leading imports in order of value in 1932 were oils, coal, metals, glass, paints, perfumes, toilet articles, drugs, etc., 13,602,217 sucres; cotton, silk, and other textiles, 11,986,174 sucres; live animals, food, and beverages, 6,614,034 sucres; leather and leather products, 4,184,546 sucres. Exports, in order of value, were: Minerals and mineral products, 22,628,085 sucres; cacao, 12,254,544 sucres; Panama hats, 6,446,653 sucres; coffee, 5,930,481 sucres; tagua (ivory) nuts, 3,217,832 sucres. Imports from the United States were valued at \$1,754,000 in 1932 (\$2,934,000 in 1931); and exports to the United States at \$2,386,000 in 1932 (\$3,603,000 in 1931). In 1933 there was an increase in imports, accompanied by a further decline in exports.

FINANCE. Budget estimates for the calendar year 1932 balanced at 49,115,440 sucres. Actual revenues for the year amounted to 34,347,000 sucres, leaving a deficit of 7,815,614 sucres. The foreign debt in 1933 amounted to \$23,951,169 (U. S. gold currency), including the government guaranteed loans of the Guayaquil & Quito Railway Co. and of the Swedish Match Company. The internal debt amounted to 22,347,078 sucres.

The ordinary budget estimates for 1933 balanced at 49,220,000 sucres. In addition, an extraordinary budget called for the expenditure in December, 1932, and in 1933 of 5,530,000 sucres. Preliminary returns for 1933 showed actual receipts of 35,599,875 sucres, or about 2,000,000 more than in 1932.

COMMUNICATIONS. Ecuadorean communications in 1932 consisted of about 702 miles of railway line, divided into 9 systems; 1591 miles of main trunk highways, and 1121 miles of branch roads; air lines linking the coast cities with the other American countries; and several navigable rivers. Preparations for the inauguration of a more extended air mail service were being made in 1933.

GOVERNMENT. The Constitution promulgated Mar. 26, 1929, vested executive power in a president elected for four years by direct suffrage, and legislative power in a congress of two houses. The Senate had 32 members elected for four years by the Provinces and occupational groups; the Chamber of Deputies, 56 members elected for two years by direct vote of literate male and female citizens. President at the beginning of

1933, Juan de Dios Martínez Mera (Liberal), who assumed office Dec. 6, 1932.

HISTORY. President Martínez Mera was removed from office on Oct. 18, 1933, when 22 of the 32 Senators voted to impeach him. Neither the President nor the 10 minority Senators attended the session, which was secret. The impeachment proceedings were witnessed by a small group of army officers, pledged to secrecy. President Martínez Mera was the fourth executive deposed by Congress since 1931. Elected on Oct. 31, 1932, and inaugurated Dec. 5, 1932, Señor Martínez Mera found himself in conflict with Congress from the time that body convened on Aug. 10, 1933. The fight against him was led by factions of his own Liberal party, the Conservatives, and some ambitious army officers. The President refused to surrender his powers to Congress or to heed its demand for his resignation. Congress retaliated by overthrowing the successive Cabinets which the President appointed. Finally, on October 11, the Senate received impeachment charges lodged against the President by the Chamber, the verdict being rendered a week later.

The Senate having declared the office of President vacant, Premier Abelardo Montalvo automatically became Acting President. As provided by the Constitution, within eight days after entering office he called a new Presidential election for the middle of December. The Conservatives, hopeful that the rampant factionalism within the Liberal ranks would enable them to return to power for the first time in decades, nominated José Velasco Ibarra as their candidate. Colon Eloy Alfaro, Ecuadorean Minister to the United States and a son of former President Eloy Alfaro, was nominated by the Liberals and Carlos Zambrano by the Socialists. Velasco Ibarra was proclaimed winner of the election held Dec. 14-15, 1933. A majority of the Liberals refrained from voting.

While Congress was engaged in its partisan and unifying wrangle with the President, negotiations were proceeding between Colombia and Peru at Rio de Janeiro for a settlement of the dispute over territory in the upper Amazon basin, part of which Ecuador claimed (see PERU under *History*). In September, the Ecuadorean government demanded admittance to the Rio de Janeiro conference. The request received a sympathetic hearing in Colombia but was rejected by Peru, which demanded that its dispute with Ecuador be settled by direct negotiation. Ecuador, weakened by internal dissensions, was unable to press its case.

EDUCATION IN THE UNITED STATES.

CONDITIONS. Educational conditions in the United States have reached a state that is best described as a crisis. In many respects this country must face educational problems more serious than are found in any of the European nations. In such countries as England, France, Germany, Belgium, Denmark, Norway, and Sweden the depression has been in force longer than it has in the United States, yet at no time have the schools in these countries suffered as the schools in the United States are now suffering.

It is difficult for an average citizen to grasp the significance of the difficulties which now beset the schools of the United States. He is inclined

to believe that the alarms sounded by school people are evidences of selfish interests. Meanwhile, educational matters have been allowed to drift. Neither educators nor others have proposed definite policies that might guide in rehabilitating the schools. The one exception to this statement is found in the tendency of the public to provide for the teaching of the traditional fundamentals and to eliminate all other subjects of study.

The problems that the schools face are of two characters. There are the difficulties brought about by economic conditions, and there are the equally serious difficulties caused by confusion regarding the aims and ends that education should serve.

Late in November, the United States Commissioner of Education made public *A Summary of the Effect of the Economic Crisis in Education in the United States*. The report was entitled *The Deepening Crisis in Education*. The information was derived from various sources. It represents, therefore, facts derived from sources other than schools as well as those reported by school officials. Among other things, the summary shows that no less than 2,280,000 American children of school age, who, according to most compulsory education laws, should be in school, are not enrolled. At least 100,000 of these were added this fall because schools were closed and they had no opportunity to attend.

Nearly 2000 rural schools in 24 States failed to open this fall. As far as is known, no city schools have been closed. In some places schools both elementary and secondary have become tuition schools. The report mentions one city of 15,000 population in which a tuition of \$3 per month is charged in the elementary schools and \$5.50 per month in the high school. In that city, at least two hundred children are out of school because their parents cannot pay the required tuition.

Many private and parochial schools have been closed and estimates indicate that 1500 commercial schools and colleges have been closed.

Lack of available funds has caused one in every four cities to shorten school terms. No less than 715 rural schools have no expectation of remaining open more than three months. This shortening of school terms this year comes after reductions in terms during the past three years. The result is that terms in practically every larger American city are now one or two months shorter than they were in those same cities 70 to 100 years ago. Various States report that further reductions in school terms are inevitable under present conditions.

In normal times the schools in the United States were in session an average of 172 days. This is in contrast with 200 days in France; 210 days in England and in Sweden; and 246 days in Germany and in Denmark. Under present conditions, many if not the majority of American children have barely half of the school opportunity that is supplied by many European nations.

Reports from various States present a distressing picture of teachers' salaries. Arizona reduced salaries from 20 to 40 per cent, and further reductions are anticipated. Illinois has reduced salaries 10 per cent and will reduce further. In addition, teachers have suffered loss through the discounting of warrants. In Iowa one-half of the teachers receive \$750 per year or less. Michigan reports that salaries have been and will be reduced as much as 60 per cent unless more aid is

provided. Nebraska schools reduced salaries 40 per cent. Other States report reductions of 20 per cent or more.

In prosperous times the salaries paid to teachers were considered very inadequate. The fact that such a large proportion of the schools are in session easily leads to the notion that at present teachers are well paid. The actual salaries received by teachers are small. One of every four American teachers is now working at a rate of less than \$750 and more than 40,000 of the teachers in those schools will receive less than \$450. In 18 States some of the teachers are paid in warrants which are cashable at discounts ranging from 5 per cent up.

School services have been greatly reduced or eliminated. In a study of 700 typical cities the following conditions were found:

67 reduced art instruction—36 eliminated it.
110 reduced the music programme—29 eliminated it.
81 reduced the physical education work—28 eliminated it.
65 reduced home economics work—19 eliminated it.
58 reduced industrial art instruction—24 eliminated it.
89 reduced health service—22 eliminated it.

Kindergartens have been eliminated in many cities and in some States.

It is estimated that there are at least 200,000 unemployed certificated teachers. When the depression was first felt in the schools the administration brought about economies by increasing the size of classes. In spite of the fact that the enrollment of pupils in city schools has increased there are now some 18,000 fewer teachers employed in cities than in 1931. In one State the enrollment per teacher is 44 children. The average for five States is more than 40.

It would require more than 75,000 teachers to care for the 2,280,000 children of school age who are now not attending.

The schools are under the necessity for caring for more children. There were 728,000 more pupils enrolled in high schools in 1932 than in 1930. In the elementary schools, however, the condition was changed. In these schools there were 115,000 fewer children in 1932 than in 1930. This is the first decrease in enrollment in the history of the country. The abolition of child labor will further increase the number of children who should attend.

The closing of private and parochial schools swells the total of those who should be provided with public school privileges.

The enrollments in the nation's schools increased by more than 1,000,000 between 1930 and 1932, but the funds available for the support of education decreased by fully \$368,000,000. This means that current expenses have been cut by about 20 per cent since 1930.

The per capita cost of current expenses for public education in cities was cut 22 per cent from 1932 to 1933. To accomplish this, boards of education reduced salaries, delayed needed repairs, economized on supplies and textbooks, eliminated important school services, increased the size of classes, and shortened terms.

In the school crisis debts have a major influence. During the period of prosperity communities were easily persuaded to bond themselves for the construction of new buildings. It now develops that many of these places should not have built, or if they did, they should not have constructed such expensive buildings. Already 259 school districts in 29 States have defaulted on their indebtedness

and there are evidences that many other districts must follow their example.

The interest that will be paid during the current school year will amount to about \$150,000,000. Districts that attempt to refinance themselves find that they must pay 6 per cent instead of 4 per cent which was the former rate.

It is estimated that there are outstanding no less than \$40,000,000 in warrants that have been given to teachers in payment of salaries. Also there are large amounts of public school funds in closed banks. In a single State there are \$15,000,000 such frozen school funds.

The causes of the economic crisis which the schools are facing are varied. The most significant cause is found in the fact that the schools have been kept as local enterprises. This means that financial support must come mainly from local taxes. Such taxes depend chiefly upon real estate. The depression has made it difficult to collect such taxes. In some districts as much as 30 to 40 per cent of the taxes have not been collected. In Michigan alone the tax delinquencies were estimated at \$100,000,000 for the past school year. In Missouri the school tax delinquencies amounted to \$13,800,000.

The assessed valuations of property have been greatly reduced. In some districts assessments on real estate have been reduced by one-half. In addition to this many States have passed laws that limit the amount which may be raised by taxes on real estate.

The depression is having an influence upon the type of teachers employed in many sections. In such places people without training and proper equipment are employed because they can be hired for less or because such local people are in need of assistance and this method is taken to relieve them. Thus it happens that with thousands of highly trained people available many places are losing the opportunity to improve the teaching body in their schools.

The difficulties that public education experiences because of confusion regarding aims and purposes are scarcely less serious than those caused by economic conditions. This confusion is due in large part to differing conceptions regarding the purpose that public education is to serve. In the past the main purpose of the school was to preserve that which society had come to regard as significant. In school the child was supposed to be put in possession of inheritances from the past. The nature of the requirements placed upon the school caused it to move a quarter of a century behind society. Those who determined the policies of the school believed that the learner should be concerned with those matters that were established and permanent. They went far enough to bar from the public schools all those questions that were concerned with the immediate changes that were taking place in society. These questions must always be of a controversial nature and it was held that the school must not concern itself with controversial subjects. The combinations in arithmetic, the recognition and interpretation of printed pages, and the formation of the various symbols of writing did not change. So these subjects represented by the so-called "three R's" formed the basis of the school offering.

Outside of the school the conditions surrounding child life were quite unlike those of to-day. The home was so organized that the child had his part in its conduct. He was supplied with "chores" that were in no sense artificial. He learned the

application of that which he acquired in school in actual use outside of school. In a less complex life than is now common, he participated directly or indirectly in considering all of the problems that affected the neighborhood in which he lived. This type of education impressed those who participated in it so strongly that there has been a tendency to continue it. Even to this day the older persons in most communities believe that all the difficulties that the schools experience could be remedied by a return to the practices that obtained in their school days.

For many years there have been individuals who condemned the school for keeping aloof from current problems. The late President Eliot often complained that the schools were twenty-five years behind the times. There has been a tendency to bring newer subjects into the school curriculum. These newer subjects have been introduced over pronounced protests on the part of many. Such subjects have been characterized as "fads and frills" and as such they have been under constant criticism. The fears that the public has had in regard to the matter of bringing schools up to date are indicated in the number of legal enactments regarding what shall and what shall not be taught in publicly supported schools. Such new laws have been particularly common in the past dozen years.

Conditions occasioned by the depression have served to emphasize the differences between those who believe that the school is required to preserve that which society now has, and those who hold that the school must take its part in the changes that are taking place and thus become a reforming agency. Thus far, the more conservative groups have had the greater influence upon practice. They have advocated and secured greater attention to the so-called fundamentals. Their influence has been sufficient to eliminate many of the more modern subjects, which they characterize as "fads and frills."

There is no way to predict the extent to which the modern school will be controlled by a most conservative policy. The more progressive practices have not won the confidence of the public, and what is more important, there are many leaders in education who frankly express doubts concerning the effectiveness of the subject matter and methods advocated by the progressives.

There is no accepted plan or policy for education that receives united support. It happens, therefore, that the public school system finds itself in the midst of its most critical period with no acknowledged leadership and with no definite proposals about which support might be rallied.

The financial problems of the public schools are pressing for solution. In most places the solution is sought in the direction of increased State support. New York State furnishes an illustration of the trend toward State aid to education. In 1919, the total cost of education in New York State was \$92,333,179. Of this the State appropriated \$7,424,440. In 1932, the total cost had risen to \$377,231,000, of which the State paid \$104,292,828. The increase in total expenditures was more than 300 per cent, but the increase in State aid was 844 per cent. The State decreased its appropriation by 10 per cent for the current school year. In July, Governor Lehman appointed a committee to determine whether there could be further economies without injury to the schools. Early in December, the committee made public its report. The majority of the committee held

that the State should return to the full amount allowed by law. A minority held that the appropriation for the coming year should be the same as that appropriated for the current year. One member disagreed and presented a report in which he urged drastic economies.

During the year the report of the National School Survey was made public. This survey was conducted under the guidance of the National Office of Education. The director, Dr. Paul R. Mort, has summarized the principal results of the survey as follows:

1. In most States the economic ability of the local school district determines the programme of child welfare in the district; and in thousands of localities this ability is too low to provide proper care and education for children. There are vast areas, therefore, where schools are ceasing to exist.

2. In most States there existed, even at the peak of prosperity, areas in which educational opportunities were of the most meagre type.

3. A century ago, when the battle to transfer the cost of education from individual parents to the whole local community was won and resulted in that system of free public education which became basic in American life and ideals, the local community was able to bear the burden. Drastic social change, however—especially that which has taken place during the last 25 years—not only has thrown greater responsibility upon public education in the rearing of healthy and law-abiding children but has seen the local community less and less able to bear the cost of this responsibility. Wealth has been concentrated in the great urban centres and in the hands of a relatively small number of persons.

4. A fundamental change required to-day is the transfer of the burden of support of education from local communities to the entire State.

5. The property tax is overburdened. More use must be made of other forms of taxation.

6. It is possible to have education financed by the individual State without removing control of teaching and the curriculum from the local community. It is recommended that the States set up satisfactory minimum programmes of education which can be financed without throwing larger burdens upon any one local community than upon any other.

7. Increased local efficiency in education will come through the further grouping of small, inadequate school districts.

8. No State in the union to-day equalizes the educational tax burden satisfactorily. No State can hope to do so unless it abandons the obsolete principle of throwing the whole tax burden upon local communities.

9. New York, Delaware, Maryland, North Carolina, Missouri, and California are examples of States that approach the ideal more closely than the majority of the States. They lead the nation in providing equal educational opportunities to all school districts within the State.

10. The report of the National Survey of School Finance sets up guides and standards for attainment of equitable indices for distributing school funds in every State. These provide a basis on which every State can take immediate action to stabilize the financing of its public schools.

There are many influential organizations that urge increasing economies in the support of schools. Among these organizations is the United States Chamber of Commerce.

There is an increasing number of people who believe that the only way in which our educational problems can be met is to have the Federal government grant substantial aid. Even now the cities and school districts are able to obtain money from the government for school buildings. Of the amounts so loaned, 30 per cent need not be repaid. School authorities have not been active in accepting this assistance. Apparently, more and newer school buildings are not now as necessary as are the means for conducting such schools as the public desires.

EGYPT. A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1933, King Fuad I.

AREA AND POPULATION. Excluding the Anglo-Egyptian Sudan (q.v.), the possession of which is in dispute between Great Britain and Egypt,

Egypt has an area of 386,000 square miles and a population at the census of 1927 of 14,217,864. The settled land surface is only 13,574 square miles. The estimated population in 1932 was 14,945,000. Births in 1931 numbered 864,631; deaths, 397,706. The chief towns, with their populations in 1927, are: Cairo, 1,064,567; Alexandria, 573,063; Port Said, 104,603; Tanta, 90,016; Mansûra, 63,676; Asyût, 57,136; Faiyûm, 52,863; Zagazig, 52,839; Damanhûr, 51,709. Moslems formed 91.19 per cent of the 1927 population; Christians, 8.34 per cent; Jews, 0.02 per cent.

EDUCATION. In 1927, about 88 per cent of the population over 10 years of age were illiterate. Primary instruction is furnished mainly in native schools called *maktabs*. In 1931-32, there were 1624 *maktabs*, with 158,885 pupils, under government inspection, besides numerous uninspected schools. The State University of El Azhar at Cairo, with its affiliated institutions, enrolled 2332 students in 1931-32. There were 10 higher colleges and various special, technical, and secondary institutions.

PRODUCTION. The cultivable area of Egypt Proper in 1930 was 8,552,000 acres, or 3.5 per cent of the total area, and consisted mainly of irrigated land in the Nile valley. Of the total population, 62 per cent were directly engaged in agriculture and a large proportion of the remainder were indirectly dependent upon it. Cotton occupies some 32 per cent of the cultivated land and is the chief money crop. Production of the chief crops in 1932 (thousands of units, bushels except as indicated) was: Wheat, 52,586; barley, 12,067; corn, 92,949; beans, 16,425; rice (rough), 26,945; onions (pounds), 663,546; sugar cane (metric tons), 2199; raw sugar (metric tons in 1932-33), 161; cotton (pounds in 1932-33), 415,860 (615,196 in 1931-32). Livestock (thousands) in 1932: Cattle, 909; buffaloes, 882; sheep, 1344; swine, 11; camels, 156; asses, 795.

Mineral production, in metric tons in 1931 was: Petroleum, 289,419; phosphate rock, 257,011; manganese iron ore, 101,781. The sea and lake fisheries in 1931 yielded 9850 metric tons of fish and the Nile fisheries 5930 metric tons. Sugar, cigarettes, petroleum products, and articles for local consumption are the principal manufactured products.

COMMERCE. Egyptian foreign trade declined approximately 50 per cent during the period 1925-32, as shown by the accompanying table.

EGYPTIAN IMPORTS AND EXPORTS
[In 1,000 Egyptian pounds, equal to \$4.9431 at par]

Year	Imports for consumption	Exports of Egyptian products	Excess of imports
1920-24 (average)	60,284	59,030	1,204
1925-29 (average)	53,872	51,577	2,295
1930	47,187	31,941	15,241
1931	31,528	28,074	3,454
1932	27,426	26,987	439
1933 *	26,757	29,519	2,762 ^b

* Preliminary. ^b Excess of exports.

Cotton textiles accounted for 12.7 per cent of the value of all imports in 1932, fertilizers, 6 per cent; tobacco and cigars, 5.9 per cent; metal and metal articles, 5.5 per cent; coal, 4.2 per cent. Silk fabrics, constructional timber, woolen fabrics, mineral oils, and paper and books were other leading imports. Cotton and cotton seed exports in 1932 were valued at ££19,203,000, or 71.1 per cent of the total value of exports, exclusive of cotton seed cake, valued at ££799,000, or 3 per

cent of the total exports, and cotton seed oil, valued at £E315,000, or 1.2 per cent. Molasses, sugar, confectionery, beer, cigarettes, gasoline, and oil products were other exports. The United Kingdom supplied 24.0 per cent of the value of all imports in 1932; Italy, 8.9 per cent; Japan, 7.9; France, 7.2; and Germany, 7.0 per cent. Of the exports, the United Kingdom took 38.4 per cent; France, 10.3 per cent; Germany, 9.8 per cent; and Italy, 8.1 per cent.

FINANCE. The national budget for the fiscal year beginning May 1, 1933, as passed by Parliament, provided for expenditures of £E31,979,000 and receipts of £E32,075,000, indicating an apparent surplus of £E96,000. However, the separate budget for Administration of Railways, Telegraphs, and Telephones estimated revenues of £E5,398,000 and expenditures of £E5,717,000, leaving an estimated deficit of £E319,000. Closed accounts for the fiscal year 1931-32 showed total revenues of £E37,770,616 (ordinary revenues, £E37,048,427) and total expenditures of £E36,991,858 (ordinary expenditures, £E31,619,020), the excess of revenues being £E778,758. The budget for 1932-33 estimated total receipts at £E37,492,520 (ordinary, £E37,048,427) and total expenditures at £E37,309,639 (ordinary, £E32,221,988).

The public debt on Apr. 30, 1932, amounted to £89,401,640 (sterling), compared with £89,644,840 on May 1, 1931. The annual debt charge amounted to £E3,507,277. The Egyptian pound's exchange value fluctuated in approximate relation to the pound sterling following the abandonment of the gold standard by Great Britain and Egypt in 1931. It exchanged at an average of \$3.58 in 1932 and \$4.65 in 1931.

COMMUNICATIONS. The State Railway Administration in 1931 operated 3374 miles of railway line (2489 miles of main line) and private concerns operated 874 miles of light agricultural railways. In 1930-31 the railways carried 26,937,000 passengers and 5,498,000 tons of freight, the net receipts totaling £E2,902,569. There were about 205 miles of macadam highways and 3930 miles of graded or drained dirt roads in 1932. Air mail lines connected Cairo with Europe, India, the Sudan and South Africa. In 1931, 8509 steam vessels of 31,428,601 net registered tons entered Egyptian ports and 8499 of 31,426,862 net tons cleared. See SUEZ CANAL.

GOVERNMENT. The Constitution of Oct. 22, 1930, declared Egypt an independent hereditary monarchy, in which the King exercises full executive powers through a responsible Cabinet as well as legislative powers concurrently with Parliament. The King's extensive powers include the right to veto all laws passed by Parliament, the sole right to initiate financial laws, to dissolve the Chamber of Deputies, and to appoint and dismiss Ministers. The King appoints 60 of the 100 members of the Senate, the other 40 being elected by indirect suffrage, as are the 150 members of the House of Deputies. The term of Senators is ten and that of Deputies five years, one-half the Senate being renewed every five years. Islam is the state religion and Arabic the official language. Prime Minister at the beginning of 1933, Ismail Sidky Pasha (Popular party). The Parliament elected June 1, 1931, was boycotted by the Nationalist party (Wafd), which controlled 107 out of 121 Senators and 215 out of 235 Deputies in the previous Parliament. The Wafd also refused to recognize the validity of the new Constitution

(see 1931 YEAR BOOK). Defense of Egypt is reserved to the British government, which maintains an army of occupation of about 10,000 troops in the country. Sir Miles Wedderburn Lampson, British Minister to China, was appointed Aug. 18, 1933, to succeed Sir Percy Lyham Loraine as British High Commissioner for Egypt and the Sudan.

HISTORY

FALL OF SIDKY PASHA. After guiding Egypt's destinies with an iron hand for more than three years, Prime Minister Sidky Pasha resigned with his entire Cabinet on Sept. 21, 1933. There had been a number of clashes between the Prime Minister and King Fuad in connection with the King's interference in the government. In February, 1933, Sidky Pasha was forced by ill health to relinquish his duties temporarily. While Sidky Pasha was recuperating in France, the King extended his control over the Cabinet. The Prime Minister returned to Egypt on September 5 and in a subsequent interview informed the King that he would resign unless Fuad ceased his interferences. The King declined to accept such a condition and Sidky's resignation followed.

The Prime Minister's dominant position had been partially undermined early in the year as a result of his arbitrary methods in handling the people, the press, and Parliament. The so-called Badari case, in which one youth was sentenced to death and another to life imprisonment for the murder of a sub-prefect who had tortured them for opposing the Sidky government, concentrated popular attention upon the government's conduct. Two of the strongest members of the Cabinet—Maher Pasha, Minister of Justice, and Yehia Pasha, Minister of Foreign Affairs—were dropped from the Ministry on January 4 for protesting against the government's attitude in the Badari case. The remainder of the Cabinet consisted largely of nonentities, and the lack of leadership evidenced by them following Sidky's breakdown practically forced the King to intervene.

YEHIA PASHA'S MINISTRY. A new Ministry was formed on September 27 by Abdel Fattah Yehia Pasha, the former Foreign Minister. Selected largely by the King, the new Ministry included six Independents, one Moderate Wafdist, two Ittihadists, and two Shaabists. The three strong figures in the new line-up, besides the Prime Minister, were Finance Minister Hassan Bey Sabry, Minister of Interior Mahmoud Fahmy Keissy, and Minister of Religious Foundations Naguib Gharabli. Yehia Pasha declared that his government's policy would be to concentrate on economic and financial affairs and avoid politics, a course which seemed to be in line with the mood of the Egyptian people. The Cabinet's prospects were not bright, as Sidky Pasha was the President and leader of the Shaab (Popular) party, which controlled more than half of the members of Parliament. When Sidky attempted to assert his authority over the party, however, he discovered that his position had been undermined. Attacked by many of his erstwhile followers and colleagues, he resigned on December 7 from Parliament and from the leadership of the Shaab party, which he had founded in 1930. This action removed one of the outstanding personalities of modern Egypt from the political arena, and insured the support of Yehia Pasha's Ministry by a Parliamentary majority.

OTHER DEVELOPMENTS. One of Egypt's periodic

anti-Christian agitations swept the country commencing toward the end of June, 1933. The pretext for the outbreak was the widely circulated report that an English Christian headmistress of a mission school at Port Said had attempted to convert a Moslem girl to Christianity by coercion. The highest Moslem authorities joined in the agitation, which led to acts of violence against Coptic, Protestant, and Roman Catholic institutions and representatives. To calm the agitation the government requested the English headmistress to leave the country and appropriated £70,000 for the establishment of Moslem orphanages.

Another issue which perturbed the country was the demand made by French, Italian, and British holders of Egyptian bonds for payment of interest in gold. After Egypt followed Great Britain off the gold standard in September, 1931, the government had paid the interest in sterling. Payment in gold would have involved the remittance of a sum 30 per cent larger in terms of Egyptian currency. The dispute was submitted to the courts and in January, 1933, the Mixed Court at Cairo held that the payment must be made in gold. The Egyptian government appealed to the higher court at Alexandria.

The work of raising the Aswan Dam an additional 30 feet, thus more than doubling the storage capacity, was completed in October, 1933. This work, on which more than 6000 men were engaged for three years, cost the Egyptian government £2,600,000, exclusive of the compensation due some 70,000 families of fellaheen whose lands were submerged. The purpose of the government in raising the dam was to enable cultivators to raise two or three crops yearly instead of one, to fructify a larger area, and to permit the extension of rice cultivation.

A £2,500,000 issue of Treasury bonds by the government, bearing $4\frac{1}{2}$ per cent interest, was heavily oversubscribed during the year.

See ARCHÆOLOGY; RECLAMATION.

ELDESLIE DOCK. See PORTS AND HARBORS.

ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF. A national organization founded in 1884 for the purpose of advancing the theory and practice of electrical engineering and the allied arts and sciences and of maintaining a high professional standing among its members. There are three grades of members: Member, associate, and fellow. The total membership on Oct. 1, 1933, was 15,386.

In 1933 there were 60 sections of the institute located in various cities throughout the United States and 112 student branches in colleges giving courses in electrical engineering. In addition to district, section, and student branch meetings there were held an annual winter convention in New York City, Jan. 23-27, 1933, and an annual summer convention in Chicago, June 26-30. Much of the institute's work is accomplished through its general and technical committees, of which there were 43 in 1933. Its principal publications are the monthly *Electrical Engineering*, the quarterly *Transactions*, the *Standards* of the A.I.E.E., and the *Year Book*.

The officers elected for 1933-34 were: President, J. B. Whitehead; vice-presidents, J. Allen Johnson, E. B. Meyer, K. A. Auty, Stanley Stokes, C. R. Higson, A. M. Wilson, F. M. Craft, R. B. Bonney, R. W. Sorenson, and A. H. Hull; treasurer, W. I. Slichter; secretary, H. H. Henline. Headquarters are in the Engineering Socie-

ties Building, 33 West Thirty-ninth Street, New York City.

ELECTRICAL ILLUMINATION. There were 616 million incandescent lamps sold during the year 1933. This is a greater production not only than in the preceding year but in all previous years except 1929 and 1930. Of the lamps sold 56 per cent were of standard size and 44 per cent were of miniature size.

The Century of Progress Exposition at Chicago was the outstanding event in illumination as illumination was one of the features of the fair. The Fair was opened with the turning on of the lights by an electrical signal set up by the light from the star Arcturus, 40 light-years distant. The light was received through a telescope in the Harvard Observatory, focused upon a light sensitive photo-tube which produced a faint electrical current. This current was amplified by tube amplifiers and transmitted to the exhibition grounds. The illumination of the grounds of the fair attracted much attention and made night the most desirable time to visit the fair. In addition to the utility illumination by incandescent lamps which were arranged with very good taste there were many decorative features, such as pylons, fountains, and lanterns in which gaseous lamps (neon and mercury) were used with delightful effect. Some of the buildings were windowless, the only illumination was electric, day and night, and unusual effects were intentionally produced.

The leaders of the science of illumination set up new values for standards of desirable illumination as reported by the Committee on Illumination of the A. I. E. E. These resulted from a discussion and questionnaire and gave results as follows:

	Foot-candles illumination		
	Work	Social	General utility
Minimum good present practice	15	5	3
Minimum recommended, present	30	10	5
Probable greatest economic advantage	50	15	5
Possible desirable from consideration of eyes only	300	50	30

This indicates that it is considered to be an economic advantage to use about three times the intensity which is now in common practice.

The photo-voltaic cell, sometimes called a photronic cell, has grown in popular favor as a means of measuring illumination in foot-candles. It is now available commercially at reasonable prices and in portable form for direct reading in foot-candles. The electrical output of the cell is directly proportional to the light falling upon the cell (a disk). This output is impressed upon a small electric meter whose scale is calibrated in foot-candles and sometimes with additional information such as "good for course work." These instruments are also made in a pocket size to be used by photographers to estimate the proper time of exposure.

The Sodium Vapor Lamp has progressed to the stage where two practical installations have been made for highway lighting, one at Schenectady, N. Y., and one at Port Jervis, N. Y. Each lamp has a hot cathode taking 20 watts for heating and 6.6 amperes direct current in a series system for the arc. Each lamp consumes about 250 watts and gives 10,000 lumens or 40 lumens per watt as compared to 15-20 lumens per watt for incandescent filament lamps. The lamps give an orange-yellow colored light which is almost monochromatic but

one to which the eye is very sensitive so it gives a maximum of visible light. The light comes from a glow discharge in the sodium vapor which is excited by a hot oxide-coated cathode which ionizes the sodium vapor. A small amount of neon vapor is included to accelerate the starting as even with this it takes about 30 minutes to reach brilliancy after starting the current. The direct current is supplied from a thyatron tube rectifier which takes its power from a 120 volt alternating current network.

A new double filament three-light incandescent lamp was put on the market which can be operated at three degrees of brilliancy by the change of a switch. These lamps require special sockets having connections for three leads and are intended primarily for stores. They operate with one low candle power filament or with one high power filament or with both together. A new 250-watt lamp was introduced which is made in a small enough bulb to be conveniently used in portable lamps for interior lighting. Also a new 2000-watt "Movieflood" lamp for making colored motion pictures. Its peculiarity is that it produces a light whose spectrum includes all the colors so proportioned as to be especially suited to the making of colored photographs and thus gives a better photographic effect than 3000 watts in ordinary lamps. Other interesting novelties are: a Christmas tree lamp containing neon so that when the filament burns out the bulb will glow and indicate the trouble; a new Photoflash lamp giving $17\frac{1}{2}$ million lumens for $\frac{1}{60}$ of a second, more than ever before; a new lamp, giving local doses of ultra-violet light, which consists of an ordinary lamp bulb into which there is set a small circular window of glass so thin that it transmits a very large percentage of the ultra-violet light produced inside by the usual means. The remainder of the glass is almost opaque to the ultra-violet rays.

Among new research or scientific development are: A new meter for measuring accurately the amount of ultra-violet light. A new X-ray tube for a hospital in Chicago, containing a tube fourteen feet long, using 800,000 volts and giving the effect of an amount of radium which would cost \$75,000,000. An X-ray outfit for taking pictures in which the current for operating the tube comes from a charged condenser which may be charged to any desired voltage and then discharged through the tube. The condenser may be charged leisurely, thus requiring low power, and discharged suddenly giving high current and power to the tube. As the taking of a picture requires only a fraction of a second this is very satisfactory.

A new spectroscope which is the largest yet built will give a spectrum so long that the energy in each wave-length may be more easily and accurately determined.

ELECTRICAL INDUSTRIES. There have been no dramatic advances in the electrical industry in the year 1933 but there has been a great activity in the improvement of details leading to increased economy of production and improvement in the control of manufacturing processes to produce a better and more uniform product at a reduced cost. The use of electron tubes in the control of motor operated machinery is an outstanding characteristic of the year. Thus in spot welding of stainless steel and aluminum the time of application of current for each spot is limited to a few cycles (sixtieth of a second) by means

of an electron tube as a switch. Longer applications would permanently stain the surface. In wrapping packages, bread for instance, the article is centred in the reading matter on the wrapper and the paper is cut when a certain spot on the paper comes opposite a photoelectric tube.

In the rolling of sheet steel and tin the carriage must be started and stopped forty times per minute. This is done when a certain spot on the moving carriage comes opposite a photo-tube. The reason for the use of the tubes is that they have such a small time lag in operating that it is negligible in the mechanical movement of physical bodies. Accurate control devices were introduced for pulling sheets from the rolls under a definite and constant tension by means of machines operating as motors pulling to take up the sheet and as generators to let it go back under the same tension. Another device automatically controls the separation of the rolls for each successive pass, setting them up accurately for the thickness desired. A new device replaces laborers and tongs by a motor operated table for receiving sheets after one pass through the rolls, lifts the sheets and by tilting sends them back for another pass. A new steel bar mill was put into operation using a 3000-h.p., 60-cycle, three-phase induction motor operating at 6600 volts. A new radiation pyrometer was introduced which indicates the temperature of metals for temperatures above 1500° F. (815° C).

One of the outstanding steps of the year was the advance in the science and art of noise measurement. Under the auspices of the American Standards Association, tentative standards of noise and methods of measuring noise were set up. Noise is measured by means of a microphone such as is used in telephone and broadcasting service. The alternating current set up in the electric circuit of the transmitter is analyzed and measured and compared with standards. As noise is a vibration of many different frequencies it is very difficult to compare the loudness or intensity of two noises of different qualities. Hence, the noise must be analyzed into its component frequencies and the results interpreted by a specialist. A frequency of 1000 cycles per second has been chosen as a standard of reference and complex noises are compared with this simple tone. The loudness of a complex tone can only be determined by averaging the results obtained in tests by several different observers. A unit of intensity or loudness, the "Decibel" has been adopted and a logarithmic scale of intensity has been proposed such that an increase of three decibels on the scale corresponds to a doubling of the intensity of the sound.

An idea of the working of the scale is given by the following examples:

Lower threshold of hearing	0. decibels
Quiet bedroom	29. "
Ordinary office	49. "
Limit of conversation	89. "

This last condition of 89 decibels represents 1,000,000 times as great an intensity of noise as the quiet bedroom of 29 decibels. We now have a basis for standards of noise intensity, a laboratory means of measuring sound and a portable apparatus for measuring sound.

It is now the practice of manufacturers of electrical apparatus to analyze the noise made by each new type of machine and frequently it happens that on ascertaining which frequency is the

strongest the offending part of the machine may be located and that particular noise be eliminated. The new fan motors are practically noiseless and most modern motors run very quietly.

The electro-chemical industry has been more active than most branches. Electric furnaces of both the induction and resistance types for temperatures of from 2000° F. to 2500° F. have been introduced in considerable number because they are particularly suitable for this temperature range and because the temperature may be so accurately controlled. A superior grade of cast iron is now produced by the electrical furnace. It has a higher tensile strength (100,000 lbs.) and greater uniformity of quality. It is replacing steel for many applications. Lithium, the lightest known metal, is now produced in considerable quantities by electro-chemical means and is used in the metallurgy of iron and copper for purification and is added to aluminum to improve its qualities. Magnesium and beryllium are electro-chemical products now coming into vogue in the construction of aircraft. Iron pipes and rubber articles are now made by electrolytic deposition. Furnace temperatures are now accurately controlled by a new radiation pyrometer which automatically raises and lowers the temperature of the source.

Hot cathode rectifying tubes are now available for as high voltages as 100,000 and give sufficient current so that they are replacing the mechanical rectifier used in precipitation processes such as smoke abatement, dust removal and by-product recovery in accordance with the well-known Cottrell Process.

"Gear Motors" are now becoming quite general for the drive of low speed mechanisms. A high speed, high efficiency motor has been incorporated in its housing a reducing gear by means of which the armature may run 1800 to 3600 r.p.m. and the projecting shaft at very low speeds. The saving in the cost of the high speed motor more than balances the cost of the mechanical gearing and the efficiency is better. Totally enclosed and ventilated motors may be used. Under process of development is a new polyphase a.c. motor operated by hot cathode tubes which gives a high starting torque, adjustable speed throughout the full range and a high power factor. Electric welding has been extended to new fields and large tubular boilers, even for high steam pressures are now put together by electric welding. The worn rails on railway tracks are now repaired by a process of building up with new material by means of a portable welding outfit consisting of a generator, driven by a gasoline engine and the necessary control equipment. The whole outfit is self-propelled, using the same gas engine for power. Improvements in the art of electric welding give assurance that the welds will have a strength from 90 per cent to 99 per cent of the parent metal. A very considerable improvement has been made in the electrical and magnetic qualities of sheet steel for electrical machinery.

The improvement in methods and quality of refrigerators has continued along with a reduction in price and 1,000,000 were sold in 1933. This has contributed to the development of the art of "air conditioning" in which there has been quite an advance, both in method and use. In the domestic line there has been more activity than in any other branch of the electrical industry. Kitchen engineering is now an accepted name for this branch of electrical engineering and covers

scores of devices from ranges, washing machines, ironers down to stirrers and flat irons.

A new Institute of Electrical Appliances was opened at Nela Park, Cleveland, devoted to the display and demonstration of electrical appliances for the home. A complete home is furnished for living and equipped with the most modern electrical conveniences and is open to the public for its information and education.

ELECTRICAL MARINE ENGINEERING.

There was very little activity in electric marine engineering. The steamship *Washington*, a sister ship of the *Manhattan* (see 1932 YEAR BOOK) was the only interesting new vessel. This has all its machinery electrically driven except the propelling machinery. There are 8000 lights and 4000 horse power in motors including 93 fans, 20 motor-driven windlasses, 18 motors for boat hoists, a 290 h.p. on the anchor windlass, and others. These are supplied by four 500-kw. direct current generators driven by steam turbines and a 75-kw. emergency generator driven by a Diesel engine. Considerable development work has been done on alternating current motors for driving the auxiliaries on ship board. There was put into service by the United States Engineers Corps a large suction dredge using a 1200 h.p. motor for the pumps, a 225 h.p. motor for the cutter and other auxiliary motors. These received their power from a set consisting of a steam turbine driving five generators; one 1000-kw., one 200-kw., two 75-kw., and one 15-kw. Some of these generators served only one motor in order to provide independent voltage control by the Ward-Leonard system and give exact regulation of the power and speed of operation.

ELECTRICAL PRECIPITATION. See CHEMISTRY, INDUSTRIAL OR APPLIED.

ELECTRIC LIGHT AND POWER INDUSTRY. In the year 1933 the central stations of the country had an output of 80,000,000,000 kw.-hrs. of which 59 per cent was from steam and 41 per cent from water power. The gross income was \$1,917,000,000 showing an average receipt of 2.4 cents per kw.-hr. Domestic service took 11.9 billion kw.-hr. at an average rate of 5.55 cents. Small commercial customers took 11.9 billions and the large commercial customers took 34.4 billions at an average rate of 1.36 cents. Taken as a whole the output was 3 per cent greater than in 1932 and the revenue 3.5 per cent less. There was an addition of 346,000 kw. to the plant capacity making a total of 36,200,000 kw. with a capital investment of \$12,800,000,000. The number of customers remained the same at 24,000,000 and the number of employees 237,000. Increased care reduced the rate of coal consumption from 1.51 lbs. per kw.-hr. in 1932 to 1.48 in 1933. Noteworthy new installations were: the new Port Washington Station in Milwaukee with steam at 1300 lbs. pressure and 850° F. temperature; the addition of two 160,000 kw. units to the Hudson Avenue Station of Brooklyn making it the largest station in the world at 770,000 kw. capacity; the completion of the Beauharnois Hydro Station on the St. Lawrence River with four units of 50,000 kv.-a. each, two for 60 cycles, and two for 25 cycles; the completion of the Safe Harbor Station on the Susquehanna River above Holtwood. This plant contains several 60-cycle generators driven by 42,500 h.p. propeller-type water turbines, the largest propellers of this type. It also contains the largest single-phase generator in the world, 37,500 kv.-a. at 25 cycles. This plant is also of great interest because there is under discussion a plan for pump-

ing water back over the dam by using the regular generators as motors and the water-wheels as pumps. This scheme is justified by the fact that the electrical capacity of the plant requires 12 times as much as the minimum flow of water. Thus, at minimum flow the plant could be operated only two hours per day unless some of the water were pumped back during slack demand.

The record for largest turbo-generator sets was again broken by the 165,000 kw. set for Philadelphia, exceeding the previous record of 160,000.

The trend in central stations has been to installations operating at 650 lbs. pressure and 850° F. temperature. The industry has acquired confidence in boilers, valves, and piping for these conditions.

There have been several interesting examples of rebuilding parts of steam stations in order to increase the efficiency and reduce the fuel costs; such as the Burlington (N. J.) Station in which a new 18,000-kv-a., 3600-r.p.m. set operating at 650 lbs. and 850° F. exhausts at 190 lbs. into three older units each of 12,500 kv-a. The new combination gives 55,000 kw. instead of 37,500 and shows a heat rate reduced from 24,000 to 15,000 B.t.u. per kw.-hr. This new 3600 r.p.m. machine is the largest capacity unit operating at 3600 r.p.m. but a 25,000 kw. at 3600 r.p.m. is now under construction. The voltage rating of alternators has been raised to 36,500 v. in a 31,250 kv-a. machine. The most sensational innovation of the year is the station at Langerbrugge, Belgium, which has a turbo-generator of 31,250 capacity, operating at 3200 lbs. steam and giving 36,000 volts.

In the electrical operation of stations the principal consideration this year has been given to improvement in operating technique and economy with particular attention to inter-connection of stations and control of energy flow. Phase shifting transformers have been introduced, notably the 100,000 kv-a. set in Chicago, by which the exchange of power between two systems may be arbitrarily and accurately controlled by a slight shift of phase between the voltages of the two systems at the point where they are interconnected. Frequency and Time Control is another subject which has received much attention. Because interconnection requires absolutely the same frequency and because the now popular electric clock requires constant frequency, devices have been developed so that the frequency does not vary more than $\frac{1}{40}$ of a cycle (in a 60-cycle system) and the cumulative error will not cause the clocks to be more than 20 seconds off. Some systems keep the error down to 3 seconds.

It is a question as to which station of a system shall control the frequency since if it is done by two stations of a system by manual operation there is liable to be misunderstanding and large surges of power. A new device puts an automatic control in each of several stations. These devices are all electrically interconnected so they all endeavor to correct the frequency at the same time and by the same amount, thus the division of load is not disturbed and the load division between stations may be arbitrarily made as desired by the power dispatcher. There have been additional instances of connecting large electrical systems together. The interconnection between the Niagara Hudson System and the United Electric Light and Power of New York City was completed with 110,000 volts from Amsterdam to Pleasant Valley, 132,000 volts from Pleasant Valley by overhead to Dunwoodie

and 132,000 volts by underground cable from Dunwoodie to Hell Gate Station. Synchronous motors are connected to the line at Pleasant Valley for voltage control. Washington, D. C., has been connected to the transmission system of the Safe Harbor Station by a tap on the 230,000-volt line between Safe Harbor and Baltimore.

There has been added to the Battersea Station of London, England, a third unit of 130,000 h.p. bringing the installed capacity up to 330,000 h.p. which gives it the greatest capacity in Europe. In this station the sum of \$1,250,000 has been spent on smoke prevention.

The scheme of interconnecting all the power stations of England, Scotland, and Wales into one high voltage network known as "The Grid" has been completed.

The Boulder Dam project is proceeding and contracts have been let for four electric generators rated at 82,500 kw. each at 180 r.p.m. and 13,800 volts and one smaller one. The orders were divided among three different manufacturers. The contract for some of the copper for the 270,000-volt transmission line to Los Angeles has also been let.

There continues to be much discussion about the other three power generation schemes of the Federal government, Tennessee Valley, St. Lawrence Waterway, and Columbia River Basin, but nothing definite has been settled as yet about the electrical equipment. The principal result has been the adverse moral effect upon those interested in the securities and management of privately owned public utilities.

The Federal government has offered to finance municipal owned electric systems by giving 30 per cent of the cost and guaranteeing the remainder. This offer has been referred to a popular vote of the citizens of many municipalities. In about one-half of the municipalities the vote was in favor of the proposition and in about one-half the majority was against municipal ownership. Birmingham, Ala., was the largest city to consider the proposition and a majority of its electorate voted against the proposal. See POWER PLANTS.

ELECTRIC TRANSMISSION AND DISTRIBUTION. A committee of the American Institute of Electrical Engineers has recommended a standard method of testing transmission lines to determine their ability to withstand strokes of lightning. By the application of a specified type of impulse voltage wave (time rate of rise, maximum value and rate of decrease) to the line or a sample of insulation and insulators under standard conditions of temperature and humidity, a measure of the strength of the insulation of the line is obtained. Another committee has prepared a set of recommendations for the requirements for the construction of steel towers for transmission lines with special reference to their mechanical reliability, strength against lightning and prevention of vibration. A new lightning generator giving 2,000,000 volts for the commercial impulse testing of transformers has been put on the market. New information on Lightning Arresters is available in the form of a questionnaire and study of methods of installation and performance illustrating present practice and trends leading toward a suggestion for standard practice.

It has been quite authoritatively established that overhead ground wires and thorough grounding of tower footings is the most reliable means of preventing damage by lightning. In this study,

with the aid of new recording devices, lightning voltages as high as 488,000 volts have been actually recorded and currents in steel towers due to lightning of from 5000 to 65,000 amperes. This is less than was previously estimated. As a result of these studies confidence is now felt that an overhead line for 400,000 volts could be built and give reliable operation and underground cable lines for 200,000 volts. At present the highest voltage for overhead lines is 230,000 volts while the Boulder Dam-Los Angeles line is planned for 270,000 volts. For transmission lines of moderate voltages such as 40,000 to 60,000 volts wooden poles are recommended because of the insulating quality of the wood.

For underground cables 132,000 volts is still the record in this country and in the last year there has been no failure in these installations. The same record of successful operation is reported for the 69,000 volt submarine cables under the Delaware River at Wilmington which have been in operation for four years and for the similar cables under the Columbia River near Portland which have been in operation two years. A new installation is that of 14 cables for 27,600 volts under the East River connecting the Brooklyn Edison System with the New York Edison System. Half of these are of the oil-filled type and half of the solid insulation type.

Because of financial conditions generally and the pressure from the public and the commissions for lower rates much attention has been given to the subject of "Costs of Electric Distribution." This item is a large one, varies greatly in different localities and is rather indefinite in its make-up. An Institute of Public Engineering was formed and devoted a meeting to this subject. At this meeting it was testified that this item of cost to domestic customers may vary between two cents and nine cents per kw.-hr. The principal factor affecting it being the density of customers or "customers per mile," and the other factor being the load factor or percentage of time the customers take power. The same subject was attacked by the technicians in an endeavor to reduce this cost by more effective methods. The radial system and the network system are the two methods attracting most attention. In the radial system (older) each group of customers is supplied by its own particular feeder line coming direct from some power source, while in the network system all customers are supplied from the same network of conductors with a multiplicity of feeders connected to the system at several strategic points.

There has been such an improvement in the science and practice of Oil Circuit Breakers that the new ones are vastly superior to the old ones. They are superior in that much less space is required, the time of operation is much reduced (complete interruption in from 3 to 6 cycles of a 60-cycle current) and they now may be reclosed automatically in a very short time, thus reducing the time-out and annoyance to customers. Furthermore, if the trouble still exists when the switch recloses it will open again, close again and repeat several times, and then if the trouble is still there the switch will remain open and give an indication at a distant control desk that it is open. On account of these advances old circuit breakers have been rebuilt and their capacity increased 300 per cent. Some of these circuit breakers operate on the "De-ion" principle and some use the high velocity forced oil jet.

On rural lines the expense of oil circuit break-

ers cannot be justified so "Reclosing Fuses" are used. An overload burns out one fuse and then the circuit is automatically switched to another fuse until a whole battery of fuses is burned out and then replacement is necessary.

Improvements in protective relays for operating oil switches consist in higher speed and improved selectivity of operation and schemes using positive, negative, or zero sequence voltages or currents and the use of communication or carrier current circuits for transmitting the signal from the relay to the device which it operates.

A new device known as a "Pilot" measures volts, amperes, watts, etc., at one place and gives an accurate indication of the results at a point as far distant as 200 miles. This is accomplished by means of a three electrode tube the grid of which is slightly energized by movements of the moving part of the indicating instrument. The amplified current of the output of this tube is carried to the distant receiving instrument.

ELECTRIC TRANSPORTATION. The Pennsylvania Railroad changed to full electrical operation for passenger trains between New York and Philadelphia on Jan. 16, 1933, and on April 9 on through to Wilmington on the south and Paoli on the western or main line division. There were placed in service twenty new single phase motor cars each equipped with two 370 h.p. motors and capable of hauling one trailer. In these motor cars it was possible, by improved design, to get more power without increasing the weight and thus power enough to pull a trailer whereas the former motor cars were designed to operate singly. The new cars have an acceleration of 1 m.p.h. per second and a maximum speed of 70 m.p.h. The Pennsylvania Railroad now has in its electric service 72 locomotives, 382 motor cars, and 1450 miles of track. The new freight locomotives weigh 305,000 lbs. of which 221,000 is on the four driving axles with four single armature motors. There have been installed two outdoor Frequency Changer Substations in Philadelphia taking power at 132,000 volts, 60 cycles, three phase, and giving 11,000 volts, 25 cycles, single phase through transformer stations 7 to 10 miles apart. In the New York Terminal the tracks have been equipped for operating trains with both direct current at 600 volts and alternating current at 11,000 volts. This caused trouble with the signal system which also uses the rails as conductors making three currents in the rails at one time or another during the day. This was overcome satisfactorily by a slight lowering of the frequency (100) of the signal currents. The locomotives also developed some mechanical troubles, reported to have been in the axles. Electric operation was suspended for a short period while this weakness was remedied and then resumed. In December the Federal government granted a loan of \$84,000,000 to the railroad of which \$34,000,000 is allotted to continue the work of electrification, particularly through from Wilmington to Washington.

In New York City operation on the new independent subway was extended to 207th Street and Broadway in Manhattan, to the Bronx via the Grand Concourse and to Brooklyn. New 3000 kw. units of mercury arc rectifiers were also put in service for supplying power. There is now 150,000 kw. capacity of this type of rectifier in service in this country. The Brooklyn Elevated has put in service an experimental articulated train of six cars with twelve 60 h.p. motors capa-

ble of giving an acceleration of 4.7 m.p.h. per second (double that previously used) and a maximum speed of 60 m.p.h. This train is designed to make a high schedule speed with stops every 1900 ft. and will carry over 600 passengers.

The Philadelphia and Reading Railroad opened service on its Chestnut Hill and Norristown branches with single-phase, 11,000-volt trains making 22 miles of additional route electrically operated.

The Union Pacific Railway and the Chicago, Burlington, and Quincy Railway have put into operation new lightweight, streamlined, 3-car articulated trains capable of making 100 m.p.h. with low power consumption due to reduced friction. They are powered by 600 h.p. internal combustion engines driving electric generators and electric motors. Air conditioning is also supplied.

In foreign countries electrification of main line railways with American designed apparatus has progressed in Poland, Belgium, and Holland. Among the trolley roads of U.S.A. there has been a considerable rehabilitation by the installation of new 50 h.p. motors of lighter weight with a new type of motor driven control consisting of brushes moved rapidly on a commutator giving a high rate of acceleration (4 m.p.h. per sec.) in 250 steps, and graduated so as not to jar the passengers. High speed is obtained by shunting the fields of the motors. The speed of the motor armatures is being increased and by this means the weight of the motor is being brought down to 12 lbs. per h.p. of rating. New quick acting but cushioning brakes have been devised using the electric eddy current principle with very simple mechanical brakes used only to hold the car when it has stopped.

Air conditioning is being installed on more and more cars; an axle driven electric generator has been developed so that any individual car of a train (i.e., dining car) may have its own conditioning and refrigerating equipment. This generator will supply sufficient power to do the equivalent cooling of $5\frac{1}{2}$ tons of ice per day. Trolley coaches, using overhead trolleys but no rails, have increased in popularity and are replacing trolley cars on rails (i.e., Indianapolis). Automotive or gas-electric trucks are now built with refrigerating equipment to transport and distribute perishable food. The refrigerating machinery derives its power from the same gas-engine which is used to drive the car.

There was developed a new means of communication between the locomotive and caboose of a long freight train using the track and an auxiliary wire carried on the telegraph poles alongside the track. Currents at 65 kilocycles are induced in the track by inductor coils carried near and just over the rails. These carrier currents are led to the auxiliary wire which is insulated from the rails for signal currents by condensers and thus the carrier currents can pass by joints for signal sections. The oscillating carrier currents are picked up by other inductors at the other end of the train and lead to a typical radio receiver. It is said to operate satisfactorily over a distance of five miles and similar sets located at a station connected to the auxiliary wire may join in the conversation and be used to give orders to the moving train.

ENGLAND, CHURCH OF. In England that church which is established and endowed by law as the national church. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). (For details of church government, see the NEW INTERNATIONAL YEAR BOOK, 1932, page 258.) In 1932 there were 2,417,802 Easter communicants in the 43 English dioceses. Incumbents numbered 12,743 and assistant curacies, 4189. There were baptized during the year 395,326 infants and 10,743 persons of riper years. The total voluntary parochial contributions amounted to £6,309,843.

Progress was made during 1933 toward unity of action between the Anglican Communion in England and Scotland and the Presbyterian Church of England. The Lambeth Conference of 1930 invited the Church of Scotland to enter into full and unrestricted conference with the Church of England and the Episcopal Church of Scotland. Following a conference at Lambeth Palace on April 6 and 7, an interim statement was made to the Consultative Body of the Lambeth Conference and to the General Assembly of the Church of Scotland. The latter body in May approved the statement with an addition by the Rev. Archibald

Fleming, D.D. (St. Columba's, Pont Street, London) designed to make it clear to the Anglican representatives that any agreement on the orders and sacraments of the conferring churches could be based only on the recognition of the equal validity of these and of the equal standing of the accepted communicants and ordained ministers in each church. After a third conference in Edinburgh on November 24 and 25, it was decided to adjourn until February, 1934, when a meeting will be held in London to draw up a joint report.

The movement for coöperation between the Church of England and Free Churches in England also made progress. The Archbishops of Canterbury and York, at the request of the Church Assembly, constituted in 1933 a Church of England Council on Foreign Relations to survey and uphold the contacts and relations of the Church of England especially with the Roman Catholic Communion, the Eastern Orthodox Communion, the Assyrian Church, and the Communion consisting of the Coptic and Assyrian Churches, the Syrian Orthodox (Jacobite) Church, and the Protestant Evangelical Churches of the continent. In May Canon J. A. Douglas (honorary general secretary of the Council), representing the Archbishop of Canterbury, paid an official visit to His Holiness Photius the Second, the Greek Ecumenical Patriarch, at the Phanar in Istanbul and handed him an autograph letter from Dr. Lang. In the autumn there was an interchange of views between this Council and the Church of Finland.

One of the most outstanding features of religious life in 1933 was the celebration of the Centenary of the Oxford Movement. In accordance with plans made by a Committee appointed by the Archbishops of Canterbury and York the observance of the Centenary was begun on Sunday, July 6, with a general Communion throughout the world with prayer for the peace and unity of the Church. The morning service at Canterbury Cathedral, with an address by the Primate, was broadcast by the British Broadcasting Corp. The Archbishop of York preached in the morning at Christ Church, Lancaster Gate, London, and at Westminster Abbey in the afternoon.

The fifth Anglo-Catholic Congress was also held "in commemoration of the centenary of the Catholic revival" with central gatherings and a Pageant of Youth in the Royal Albert Hall, an exhibition of ecclesiastical art at the Imperial Institute, and High Mass celebrated on July 16 by the Bishop of Colombo at the White City Stadium, attended by over 45,000 people. On Friday, July 14, Holy Communion was celebrated in the quadrangle of Keble College, Oxford, followed by a visit to Pusey's grave in Christ Church Cathedral, Oxford, a sermon in Lincoln College Chapel and other observances. On Monday, July 17, after a special service in Winchester Cathedral, there was a pilgrimage to Keble's grave at Hursley.

A great deal was done during 1933 for the provision of new churches, church rooms, and mission halls in the new housing areas throughout England. The Bishop of Sheffield's appeal for 100,000 guineas for Church Extension, launched in October, 1930, was closed on October 31, the amount raised being £113,400. An appeal was launched early in 1933 by the Archbishop of York for similar work in his diocese. A number of new churches were consecrated throughout the country, and the Forty-five Churches Fund for the Diocese of London claimed to have established a record probably unparalleled in Church history

by the consecration of two churches and the foundation-stone laying of three others on five successive Saturdays, beginning October 7.

The year 1933 saw a new departure in the relation of the Church in England to the Church overseas through the publication by the Missionary Council of the Church Assembly of *With One Accord*, the Unified Statement of the Needs of the Church Overseas in the Year 1933; the first of a series of such statements. For the first time a budget was presented to the Church of England for its work overseas, and this asked for an increase of 10 per cent in the gifts of the Church for 1933 over its gifts in 1931. The Church Assembly, at its February session, recommended the Unified Statement for consideration and action to all diocesan conferences and parochial church councils on account of urgent demands for extension, especially in the direction of providing Christian education for the hundreds of thousands who are entering the church, and for the training of leaders.

Among the appointments to the Episcopate were the following: Canon C. S. Woodward as Bishop of Bristol; the Rt. Rev. H. W. K. Mowll as Archbishop of Sydney; the Rt. Rev. J. C. Roper as Archbishop of Ottawa and Metropolitan of Ontario; the Ven. Wilfrid Parker as Bishop of Pretoria; the Ven. W. Burd as Bishop of Saskatchewan; the Ven. A. L. Fleming as first Bishop of the Arctic, a new diocese, the largest created, stretching across most of Northern Canada; the Ven. Harold J. Buxton as Bishop of Gibraltar; the Ven. W. E. Flewett as Bishop of Cork; the Rt. Rev. A. B. L. Karney as Bishop of Southampton; the Ven. C. H. Ridsdale as Bishop of Colchester; and the Ven. G. H. Clayton as Bishop of Johannesburg.

The officers of the church assembly in 1931 were: chairman, the Archbishop of Canterbury; vice-chairman, the Archbishop of York; secretary, Sir Philip W. Baker-Wilbraham; assistant secretary, Guy H. Guillum Scott; chairman of the house of bishops, the Archbishop of Canterbury; chairman of the house of clergy, the Dean of Norwich; chairman of the house of laity, the Earl of Selborne. Headquarters are at 8 Dean's Yard, Westminster, S. W. 1, London.

ENGLISH LITERATURE. See LITERATURE, ENGLISH AND AMERICAN.

ENTOMOLOGY, ECONOMIC. Outstanding events in the field of applied entomology in the year 1933 included the continued devastations of grasshoppers in the Great Plains and Rocky Mountain States, the extensive outbreak of the gipsy moth in northeastern Pennsylvania, the spread of the destructive gladiolus thrips throughout the United States, and the appearance of the pink bollworm in two counties in Georgia and of the Mexican bean beetle in the St. Paul-Minneapolis district of Minnesota. The retirement of Dr. Charles L. Marlatt, Chief of the Federal Bureau of Entomology, on his seventieth birthday after 44 years of service with the Federal government, and the appointment of Mr. Lee A. Strong, Chief of the Federal Bureau of Plant Quarantine, as his successor was of particular importance.

CODLING MOTH. The infestation of the apple by the codling moth or fruit worm throughout much of the eastern and middlewestern fruit areas was the most severe of the last decade. In the Pacific Northwest the injury caused was nearly as great as that of 1932 due in part to the uncertainty as

to the spray programme and the abandonment of an increasing number of orchards.

ORIENTAL FRUIT MOTH. This moth continued to be very abundant in most of the peach growing sections of the eastern United States. In control work conducted with baits terpenyl acetate $\frac{1}{2}$ c.c. per quart in a 10 per cent solution of medium-soft brown sugar was outstanding in effectiveness. The reduction of the injury in three orchards in Georgia baited in 1933 at a cost of not more than \$3.50 per acre was 47, 77, and 78 per cent, respectively. Due to the extensive inter-orchard movement of the moths the benefits from small-scale baiting are not cumulative from year to year. In field experiments with insecticides in Indiana a partial but not commercial control was obtained without injury from the application of nicotine tannate and nicotine sulphate each used with 1 per cent of white oil emulsion. In control work with parasites nine species were introduced from Japan and liberated.

MEXICAN FRUIT FLY. The effectiveness of the intensive measures of suppression applied against the Mexican fruit fly in the Lower Rio Grande Valley of Texas in 1932 was strikingly demonstrated by the marked decrease in the number that appeared in 1933. Despite the extensive inspections made in the early part of the year no larvæ could be found in valley fruit and only six adults were caught in traps, four in Hidalgo and two in Cameron counties.

JAPANESE BEETLE. There was a striking reduction in the Japanese beetle population as compared with 1932, which year was the worst since its discovery in this country in 1916. This was particularly noticeable in the heavily infested sections of Pennsylvania. A severe drought in July, 1932 during the period when eggs were hatching appears to have been the important factor causing the reduction. An extensive section of the more recently infested area in southwestern New Jersey was, however, severely injured. The area of continuous infestation in all States at the end of the season of 1933 increased to approximately 8600 square miles from a total of some 7600 square miles of the preceding year. The effectiveness of the standard Japanese beetle trap was still further improved and its usefulness for the protection of the second crop of red raspberries and blueberries was further demonstrated. The continued spread resulted in restrictions being placed upon parts of Maine and West Virginia and a modification of the boundaries of the regulated areas in Maryland, New York, and Virginia.

EUROPEAN CORN BORER. Following the announcement of the removal of the Federal quarantine to become effective against the European corn borer regulatory action was taken by all but seven of the uninfested States and also by the partially infested State of Indiana against the two-generation infested States. Its notable increase in the western area during the season of 1932 with a corresponding heavy population of larvæ entering hibernation and successfully overwintering indicated a great increase in borers and damage in 1933. However the late spring and rain and cold of the early summer were so unfavorable to early planting that the corn was too small to attract oviposition by the emerging moths. Such oviposition as later took place came at a period of unusually hot dry weather and resulted in the destruction of many of the egg masses, with a corresponding reduction in the

damage done. In the two-generation area in the East there was a very perceptible increase in the infestation. Many small cornfields in the southern New England States suffered a complete loss of marketable ears.

CHINCH BUG. Thriving under droughty conditions the destructive chinch bug increased notably in many of the Central and Eastern States.

HESSIAN FLY. The fall and winter conditions threatened unusual damage by the Hessian fly in the wheat growing areas east of the Rocky Mountains but the drought and heat of the early summer gave effective control and prevented damage by it. The average infestation found in a survey of fields in Ohio was 8.1 per cent as compared with 35.0 per cent in 1932.

MEXICAN BEAN BEETLE. The spread of the Mexican bean beetle was less extensive than in 1932 although it appeared far to the northwest of its known distribution, in the St. Paul-Minneapolis district of Minnesota, where its eradication was attempted. It continued seriously abundant throughout most of its entire range including the New England and Middle Atlantic States. For several years its survival in the Northern States has been progressively higher with increased damage, probably owing to the milder winters which have prevailed. In the South Atlantic and South Central States it was less abundant than in the preceding year. It appeared in Florida for the first time, at Monticello. Heavy infestations occurred in Colorado and New Mexico. It is noteworthy that the pest has made practically no advance southward since its original introduction into northern Alabama in 1919.

PINK BOLLWORM. Control work with the pink bollworm was pressed with vigor in the Texas-New Mexico-Arizona area and in the infested area in Florida. No pink bollworms having been found in the cotton growing area of the Salt River Valley of Arizona surrounding Phoenix since the 1931 crop it was released on December 23 from the restrictions of the quarantine. The pest was also eliminated from seven counties of western Texas adjoining the southeastern portion of New Mexico and these counties were entirely released from quarantine regulations in the spring. On December 23 the finding of the pest in the Staked Plains Region of New Mexico and Texas made it necessary to add two counties in New Mexico and all or parts of seven counties in Texas to the regulated area. Surveys of the Florida outbreak showed this bollworm to be present in a few cotton fields in Alachua and Columbia counties near the Georgia border in addition to the infestation of wild cotton in the southern part of the State, where excellent progress was made toward its eradication. The discovery of a single specimen of this pest in Madison county, Georgia on September 22 and later of specimens in gin trash and in a field at Enigma, involving the counties of Berrien, Cook, and Tift in Georgia, led to the extension of the quarantine to this area effective December 23. The so-called roller method of sterilizing cotton lint to prevent the spread of the pest was developed and applied commercially during the year at an operating cost of one cent per bale.

MEXICAN BOLL WEEVIL. Although unusually large numbers of the boll weevil entered hibernation in the fall of 1932 and there was a large weevil survival the excessive drought and heat in June and July over much of the cotton area effectively checked weevil development. As a result

serious infestation was spotted and limited to areas of more or less localized rains. Studies covering a period of eight years demonstrated that about 65 per cent of boll weevil mortality on cotton dusted with calcium arsenate is due to the accidental ingestion of the poison while crawling on the leaves, stems, or fruit of cotton, emphasizing the importance of uniformly covering all parts of the plants with the arsenical.

THURBERIA WEEVIL. The control work with the thurberia weevil enemy of cotton progressed satisfactorily in the Santa Cruz Valley of southeastern Arizona where due to the difficulty in obtaining water for irrigation the acreage has decreased until in 1933 there were but 800 acres in cultivated cotton. Two counties and parts of three others were held under regulation. The quarantine restricting the shipment of cotton from this area was modified on October 2 to permit the shipment of cottonseed, baled cotton lint, and baled cottonseed hulls when given certain specified treatment.

GRASSHOPPER MENACE. The grasshopper infestation and resulting loss in the northern Great Plains and Rocky Mountain States was the worst in many years. The check resulting from the cold wet spring was overcome by the favorable heat and drought that followed, their activity continuing even into early October. The intensive eradication campaign conducted in Minnesota through several seasons resulted in the damage caused in that State in 1933 to be negligible. Emphasis was placed by the State and Federal Entomologists upon the importance as a means of control of plowing grain and flax stubble in grasshopper infested areas before May 15 to prevent the young hoppers from reaching the surface. A serious outbreak of grasshoppers in the three prairie provinces of Canada resulted in great damage to wheat and other crops over a wide territory.

GIPEY MOTH. The survey which followed the discovery of the infestation of the gipsy moth near Pittston in northeastern Pennsylvania in July, 1932 resulted in the determination that an area of more than 230 square miles is infested, the extreme limits still remaining to be definitely determined. Next to the infestation found in New Jersey in July, 1920 now nearly eradicated, this is the most extensive gipsy moth infestation ever discovered in the United States west of the New England States. In the old infested area in New England defoliation was more extensive than that of 1932, the total defoliated area amounting to 286,395 acres. White pine in Massachusetts suffered severely as did cranberry bogs south of Boston and on Cape Cod. As a result of the limited control work that had been carried on in the barrier zone along the eastern border of New York State and nearby New England thirty infestations were found in southwestern Massachusetts and northwestern Connecticut. In New Jersey one hundred and eleven new egg clusters were found and destroyed during the late winter and early spring in the northernmost part of the previously infested area.

GLADIOLUS THRIIPS. The gladiolus thrips has now become widespread having appeared during the year at many points in California, and continued to damage whole crops. It apparently does not overwinter out-of-doors in the North and much can be accomplished in its control by the application of naphthalene flakes to stored corms or by immersion in semesan. The thrips can be

controlled through storing the corms for three months at a room temperature of from 35° to 40° F. In the field it has been best controlled on growing plants by weekly applications of a Paris green brown sugar spray started early.

DATE SCALE ERADICATION. The work of eradicating the date scale in the Phoenix and Yuma districts of Arizona and in the Coachella and Imperial Valleys of California was continued, date palms on infested properties being dug out and destroyed.

APICULTURE. A study of the range of flight of the honey bee on a windblown prairie area in Wyoming has shown that when there is no source of food intervening it will fly a distance of 8½ miles to gather nectar and pollen although colonies lose weight when placed five miles or more from the nectar supply.

INSECTICIDES AND INSECT CONTROL. A method for the preparation of insecticidal oil emulsions in which casein-ammonia is used as the emulsifying agent was adopted by fruit growers in the Pacific Northwest, and effected considerable economy. In experiments in Michigan propylene dichloride mixture used at the rate of two pounds to 100 cubic feet of space gave a complete kill of the European corn borer naturally established in sections of corn stalks after an exposure for 24 hours at 60° to 78° F. A spray of 8 per cent miscible oil and three pounds of lye to 100 gallons of water applied to empty grain bins gave good results as a cleanup treatment for stored grain sects in Illinois. It was found in work in Georgia that worn out oils drawn from the crank cases of automobiles and tractors gave good control of the San José scale on peach trees, provided the oil was completely emulsified with calcium caseinate and the resulting emulsion fairly stable. Investigations showed that rotenone and derris root lost more than half of their toxicity during ten days' exposure to sunlight. A new insoluble nicotine insecticide that was prepared has a toxicity for the codling moth equal to that of nicotine tannate.

PARASITES AND INSECT CONTROL. Liberations in 1929 and 1930 of 85,000 adults of the tachinid fly parasite *Ohaetawrista javana* introduced from Japan resulted in a parasitism of the oriental moth in New England of 52.43 per cent in 1932-33. The chalcid *Blastothrix sericea* introduced into British Columbia in 1928 to combat *Eulecanium coryli* a scale pest accidentally introduced from Europe which attacks many kinds of trees and shrubs including roses, has resulted in practical control in the section where the original liberation of the parasite was made. The egg parasite *Trichogramma minutum* was reported as attacking the eggs of the velvet caterpillar in Louisiana in August and September as readily as it did the eggs of the sugar-cane borer or the cotton leaf worm and even without colonization was doing much to control the pest. The results of colonization of this egg parasite in sugar-cane fields of that State over a period of six years conducted at an average cost of one dollar per acre in 1932 resulted in an average saving or gain in yield of 3.28 tons per acre in that year, valued at \$29.04.

INSECT TRANSMISSION OF PLANT DISEASES. Investigations have shown that the destructive fungous of the so-called Dutch elm disease introduced into this country from Europe, having been found in Ohio and the environs of New York City, principally in northern New Jersey, is spread by the elm bark beetles *Scolytus scolytus* and

Scolytus multistriatus. Five years of investigation in New York have shown the leaf hopper *Macropsis trimaculatus* to transmit the virus of peach yellows. In Hawaii the pineapple mealy bug was found to be primarily responsible for the widespread collapse of pineapple plants due to what is known as mealy bug wilt. This mealy bug was also found to be the cause of two general types of spotting on pineapple leaves. Aphids were determined to be responsible for the transmission of several additional plant diseases including yellow dwarf disease of cultivated onions in Iowa, cucumber mosaic in Wisconsin and crinkle disease of the strawberry in Oregon.

NECROLOGY. The death of the eminent Japanese scientist Shinkai Inokichi Kuwana, Chief Entomologist for the Ministry of Agriculture and Forestry, occurred at Tokio on July 14. Mr. Fred E. Brooks, well known investigator of fruit insects for the State of West Virginia and the Federal Department of Agriculture died at French Creek, W. Va., on March 9 at the age of 65 years. Dr. Charles R. Phipps research entomologist at the Maine Agricultural Experiment Station died on June 21 at the age of 38 years.

EQUINE ENCEPHALOMYELITIS. See VETERINARY MEDICINE.

EBITREA, ĕ-rĕ-trĕ-ă. An Italian dominion on the west coast of the Red Sea, with a coast line about 670 miles long reaching from Cape Kasar to Cape Dumeirah. Total area, 45,754 square miles; total population (1931 census), 621,776 including 4565 Italians. Asmara, the capital, had 21,601 inhabitants; Massawah, the chief trade centre, had about 15,000 inhabitants. The natives are chiefly Coptic Christians and Mohammedans. The culture of coffee, cotton, tobacco, flax, bananas, and agave (a fibre plant) has been successfully introduced. Pearl fishing is carried on at Massawah, and gold mines are worked in several localities. The local trade is almost confined to camels, oxen, sheep, goats, and their products.

Imports by land and sea in 1931 were valued at 215,042,393 lire (lira equals \$0.0526 at par); exports, 105,348,027 lire. Steamships entered Massawah in 1931 aggregated 572,742 tons. Railways extended 193 miles. The budget for 1932-33 was estimated to balance at 52,294,281 lire. In 1932 the military force consisted of 98 officers and 3611 other ranks, exclusive of the police force. Governor in 1933, Riccardo Astuto.

ESSAYS. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ETC.

ESTONIA. An independent republic on the eastern shore of the Baltic, established Feb. 24, 1918. Capital, Tallinn (Reval).

AREA AND POPULATION. With an area of 18,353 square miles, Estonia had a population estimated at 1,124,000 on Jan. 1, 1933. Estonians comprised 87.7 per cent of the total; Germans, 1.7

per cent; Russians and others, 10.6 per cent. The population of the chief cities was (1932); Tallinn, 134,000; Tartu (Dorpat), 72,000; Narva, 25,000; and Pärnu, 21,000. The people are predominantly Lutheran in religion.

EDUCATION. Primary education is free and compulsory. In 1930-31 there were 1261 elementary schools, with 105,414 pupils; 56 supplementary primary schools, with 1988 pupils; 50 secondary schools, with 14,409 pupils; and 57 vocational schools, with 4970 pupils. Tartu (Dorpat) University is a government institution, with 3292 students in 1931.

PRODUCTION. About 70 per cent of the population is engaged in agriculture and dairying. Cultivated land in 1932 totaled 2,549,046 acres, or 23 per cent of the total area, and was divided into some 133,360 holdings. There were 2,337,324 acres of forests, 2,249,686 acres of meadow, and 1,754,174 acres of pasture land. Yields of the chief crops in 1932, with 1931 figures in parentheses, were (in thousands of metric tons): Rye, 180.7 (147.8); winter wheat, 20.2 (18.7); summer wheat, 36.6 (38.6); barley, 101.3 (128.8); oats, 130.1 (164.0); mixed grain, 72.2 (91.9); potatoes, 782.8 (854.5); turnips, 169.7 (167.8); flax fibre, 3.8 (5.9); flax seed, 3.9 (6.4); hay, 1315.7 (1403.4). Livestock in 1932 included 692,310 cattle, 514,420 sheep, 302,890 swine, and 208,240 horses. The chief industries are textiles, paper, cement and oil shale, lumbering, woodworking, and leather. In 1933 the agricultural income was about 40 per cent of that earned in the best pre-depression year. The number of hours worked in large-scale industry declined from 53.3 millions in 1931 to 46.1 millions in 1932; wages paid were 20,100,000 Estonian crowns in 1929 and 13,800,000 crowns in 1932.

COMMERCE. The 1932 exports and imports totaled 42,571,000 crowns and 36,860,000 crowns, respectively, as compared with exports of 71,073,000 crowns and imports of 61,224,000 crowns in 1931. The decline in export values was 40.1 per cent; import values, 39.8 per cent. The chief 1932 export items were (in millions of crowns, worth \$0.268 at par): Butter, 15.5; cellulose, 5.1; meat, 2.5; sawn timber, 2.4; veneer, 2.1. Leading imports were (in millions of crowns): Cotton, 2.5; sugar, 2.1; iron and steel, 1.8; fertilizers, 1.0. Exports in 1932 went mainly to England, Germany, Finland, and France, while Germany, England, the United States, and Soviet Russia, in the order named, were the chief sources of imports. A total of 8581 tourists, including 785 Americans, visited Estonia in the summer of 1933. The decline in foreign trade during the period 1930-32 had severe repercussions on the national economy, as previously about one-third of the national production was exported. In 1933 exports were 45,557,700 and imports 39,029,900 crowns.

FINANCE. Actual returns for the fiscal year ended Mar. 31, 1933, showed governmental revenues of 66,069,000 crowns and expenditures of 66,008,000 crowns, or a surplus of 51,000 crowns. This compared with estimated revenues and expenditures of 82,456,000 crowns and 82,256,000 crowns, respectively. Actual receipts were 19.7 per cent below the estimate. The budget for 1933-34, as passed by Parliament, balanced at 61,955,000 crowns. The foreign debt on Mar. 31, 1933, was as follows: British government, £1,189,233; American government, \$17,203,743; Swedish government, 619,914 crowns; Swedish Match

Co., 7,600,000 crowns; banking and currency reform loan of 1927, £664,300 and \$3,771,500; others, £51,000.

COMMUNICATIONS. Estonian railways had 777 miles of line in 1931. In 1932 the railways carried 1,950,000 tons of freight and 8,100,000 passengers (2,550,000 tons of freight and 8,300,000 passengers in 1931). Gross receipts were 11,000,000 crowns (14,200,000 crowns in 1931). There are some 14,424 miles of highways. Foreign ships entering and clearing the ports in 1932 aggregated 1,590,000 net registered tons (1,963,000 tons in 1931).

GOVERNMENT. The constitution of Dec. 31, 1920, vested executive power in a state head or "State Elder," who also served as prime minister. He was elected by the State Assembly of 100 members, who were elected for three years by popular vote. State Head in 1933, Konstantin Päts, who was reelected Nov. 1, 1932. The composition of the State Assembly elected May 21-23, 1932, was: United Agrarian, 42; National Center, 23; Socialist, 22; National Minorities, 8; Radical Labor party, 3; Non-party, 2. For changes in 1933, see *History*.

HISTORY. Far-reaching amendments to the Constitution were adopted by the Estonian people by a vote of approximately 416,000 to 157,000 in a national referendum on Oct. 14-16, 1933. The principal amendment consolidated the executive power in the hands of a president to be elected by popular vote for a term of five years. The presidency and the premiership, formerly held by the State Head, were made separate offices. The president was invested with power to dissolve the State Assembly and the number of representatives in the assembly was reduced from 100 to 50. The vote reflected the wide-spread opposition to party politics, which had been organized by veterans of the war of 1918-20, authors of the constitutional amendments adopted. The Tõnisson Cabinet and the State Assembly had submitted proposed amendments to the Constitution to a national referendum on June 10. Their measure, providing for the popular election of a president for a term of four years, was voted down by 330,000 to 160,000. The Tõnisson Cabinet resigned the day after the October referendum. It had faced wide-spread opposition among the parties of the Left and of the Right since August 12, when it proclaimed martial law in all provinces, imposed a newspaper censorship, dissolved the Fascist, Socialist, and veterans' societies, and raided the houses of suspected conspirators against the state. There was fear of a Fascist *coup d'état*.

Pending formal inauguration of the new authoritarian régime, a transitional, non-party cabinet was formed by the State Head, Konstantin Päts. On Dec. 5, 1933, the Assembly voted to dissolve all Nazi organizations in Estonia and to suppress their party organs. The arrest of various leaders of the Nazi movement followed.

Another important development was the abandonment of the gold standard by the Estonian government on June 28. This lowered the value of the crown about 35 per cent and placed the country on a competitive basis with the free currency Scandinavian countries. At the same time the government took steps to moderate the expected increase in domestic prices. The 15 per cent foreign-exchange tax and the export premiums payable from the proceeds of this tax were discontinued, but the controls on sales of

foreign exchange were retained. In succeeding months, the wholesale commodity price index rose more rapidly than the cost-of-living index, thus creating a more favorable basis for the production of articles for export. On May 23 the State Assembly passed a law providing for the conversion of farmers' short-term private debts into a long-term debt which was transferred to the Land Bank. The creditors were paid in ten-year 4 per cent debentures. A new trade agreement with Great Britain, signed July 15, 1933, became effective July 22. A similar agreement with France, supplementary to the convention of Mar. 15, 1929, was signed in Paris, Apr. 27, 1933. On May 17 a clearing arrangement between Finland and Estonia, signed the previous day, became effective. On Nov. 15, 1933, the Estonian crown was definitely linked to the pound sterling at a selling rate of 18.35 crowns to the pound.

At the fourth unofficial economic conference of the Baltic states—Estonia, Latvia, and Lithuania—held at Riga, Latvia, Sept. 8-9, 1933, resolutions were adopted with respect to various subjects of mutual economic, financial, and political interest. See *LATVIA* under *History*. On July 3, Estonia joined with six other Eastern European and Asiatic states in signing a pact containing a definition of aggression, proposed by the Soviet Foreign Office. See *UNION OF SOVIET SOCIALIST REPUBLICS* under *History*.

ETHIOPIA (ABYSSINIA). An empire of East Africa. Capital, Addis Ababa. Emperor in 1933, Haile Selassie I.

AREA AND POPULATION. Ethiopia has an estimated area of 347,490 square miles and a population variously estimated at from 5,500,000 to 10,000,000. The Abyssinians proper, the ruling race, are Christians of Hamitic origin. They number less than 3,000,000. The Gallas, comprising two-thirds of the population, and the Somalis and Danakil are other important tribes. The chief cities, with their approximate population, are: Addis Ababa, 60,000; Dire Dawa, 30,000; Harar, 40,000.

PRODUCTION. The chief industries are agriculture and stock raising. Coffee, hides and skins, beans, flour, wax, civet, and ivory are the chief exports. Coffee is cultivated in Harar Province, eastern Ethiopia, but grows wild in the western district. Grain, cotton, sugar cane, dates, and grapes are grown for local consumption. The chief minerals found are iron ore, placer gold, potash, copper, silver, and platinum. There is almost no manufacturing.

COMMERCE. Foreign trade (imports and exports) in 1931 was valued at 1,275,295 pounds sterling. Of this about 80 per cent passed through the port of Djibouti, French Somaliland, via the Franco-Ethiopian railway to Addis Ababa. The imports were mainly cotton yarns and piece goods, rayon, corrugated iron sheets, hardware, cement, sugar, glass, and salt.

FINANCE. Government revenues are estimated in normal times at about \$5,000,000 annually, including \$1,000,000 in cash and the remainder in native produce paid as taxes in lieu of cash. The Maria Theresa silver dollar (thaler) is the only coin in most general use; bars of salt and cartridges are used as currency in sections of the country. The Bank of Abyssinia was taken over by the government in 1931 and replaced by the state Bank of Ethiopia, which has a banking monopoly.

COMMUNICATIONS. The only railway extends

from Addis Ababa to Djibouti, a distance of 488 miles. Under the Emperor Haile Selassie I about 65 miles of macadam highways and 1150 miles of dirt and gravel roads were completed up to 1932; others were under construction. There were some 1615 miles of dirt trails. Telegraph and telephone lines linked the capital with other leading cities.

GOVERNMENT. The constitution proclaimed July 16, 1931, provided for a unified state under the absolute rule of the emperor, who was to be advised by two nominated chambers. Succession to the throne was reserved to the present dynasty. All inhabitants were made equal before the law. Ethiopia joined the League of Nations Sept. 28, 1923.

HISTORY. The Emperor Haile Selassie during 1933 continued his efforts to modernize his backward kingdom. Early in the year he modified the feudal systems in the districts of Mattan and Elf. In the territory of Gojjam, where a rebellion broke out in 1932, the Emperor ordered a large-scale liberation of slaves. According to a report by Lord Noel-Buxton in the *London Times Weekly* (Nov. 30, 1933) the institution of slavery still flourished, despite the Emperor's decrees and efforts to eradicate it. As a result of raids made across the Kenya border by the Galubba tribe in 1932, the Emperor promised the Kenya government to disarm the tribe and punish the raiders. In July, 1933, two representatives of the Emperor, Ras Desta Demtu and Ato Paulos Manamano, arrived in the United States to return the visit of an American delegation to the Emperor's coronation in 1930.

ETHNOGRAPHY. See ANTHROPOLOGY.

EUROPEAN FEDERAL UNION. See UNITED STATES OF EUROPE.

EVANGELICAL CHURCH. A denomination formed by the reunion in 1922 of the Evangelical Association and the United Evangelical Church. (For historical details, see the *NEW INTERNATIONAL ENCYCLOPEDIA*, viii, page 202, and xxii, page 661.) In 1933 it had 25 conferences in the United States, two in Canada, one in Japan, three in Germany, and one in Switzerland, its membership throughout the world totaling 265,719. In the United States and Canada there were 229,814 members, enrolled in 2095 churches. Of the 2579 churches throughout the world 1913 were served by itinerant preachers and 469 by local preachers. The 2627 Sunday schools had an enrollment of 360,840. Working under the general direction of the board of missions were 1159 women's missionary societies, with a membership of 33,960. The total value of all church property in the United States and Canada was \$35,509,503, while the amount of money raised during the year was \$4,200,416.

The chief schools of the denomination are: North Central College and the Evangelical Theological Seminary at Naperville, Ill.; Western Union College at Le Mars, Iowa; Albright College and the School of Theology at Reading, Pa. It maintains also two orphanages and five old people's homes in the United States, as well as several hospitals. Official periodicals are the *Evangelical-Messenger* and *Christliche Botschafter*. A quadrennial general conference was held in Milwaukee, Wis., in 1930. All questions of law in the interval between general conference sessions are decided by the board of bishops, which in 1933 consisted of Bishops L. H. Seager, M. T. Maze, J. F. Dunlap, J. S. Stamm, G. E. Epp, and S. J.

Umbreit. Headquarters are at the Evangelical Press, 1900 Superior Avenue, Cleveland, O., and in Harrisburg, Pa.

EVANGELICAL SYNOD OF NORTH AMERICA, THE. A religious communion strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. When they disagree the Evangelical Synod adheres to the pertinent passages of Holy Scripture and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was founded in 1840 at Gravois Settlement, Mo., and was consolidated in 1877 with similar communions. It is organized into 20 districts and has a synodical administration, with legislative powers vested in biennial district conferences and a quadrennial general conference. The congregations are self-governing in strictly local affairs.

The communion in 1932, had 1249 congregations, 1191 pastors, and 263,411 members, also 1167 Sunday schools with an enrollment of 214,490. Money raised by the congregations for all purposes amounted to \$4,571,317, while the total value of church property was \$33,105,699. The home mission board, which reported a total income of \$103,208, employed 109 pastors in 121 fields in the United States. The foreign mission board, which reported a total income of \$135,090, employed 33 missionaries and 333 native helpers in India and 12 missionaries in Honduras.

The denomination supports two educational institutions: Eden Theological Seminary, at Webster Groves, Mo.; and Elmhurst College, at Elmhurst, Ill. It publishes also the following periodicals: the *Evangelical Herald*; the *Tidings*; the *Light Bearer*; and *Der Friedensbote*. The Rev. C. W. Locher, D.D., has been president since 1929. Headquarters of the synodical administration and the administrative boards are at 1720 Chouteau Avenue, St. Louis, Mo.

EWART, JOHN S (KIRVING). A Canadian lawyer and publicist, died in Ottawa, Feb. 21, 1933. Born in Toronto, Aug. 11, 1859, he attended Upper Canada College and after studying law at the Osgood Hall Law School was called to the bar in 1871. He practiced in Toronto until 1882 when he removed to Winnipeg where he was made King's Counsel two years later. In the prolonged political contest over the Manitoba school question during 1890-96 Mr. Ewart represented the demand of the Roman Catholic and French-speaking minority for the repeal of the laws whereby parochial or separate schools and the official use of the French language had been abolished. After 1906 he practiced in Ottawa where most of his cases were confined to those of the highest courts, the Supreme Court of Canada and the Judicial Committee of the Privy Council. In 1910 he was chief counsel for Canada before The Hague Tribunal in reference to the North Atlantic fisheries controversy between the United States and Great Britain, which resulted in American fishermen not being permitted to enter the bays and harbors of Canada and Newfoundland for any purpose than that of shelter and repairing damages. In addition to such legal works as *Manual of Costs*, *Taylor and Ewart's Judicature Act*, and *An Exposition of the Principles of Estoppel by Misrepresentation*, Mr. Ewart published *The Kingdom of Canada and Other Essays* (1908); *Canadian Independence*

(1911); *The Kingdom Papers* (1912); and *The Roots and Causes of the War, 1914-18* (1925).

EXPLORATION. Four years of world economic depression reduced explorations and allied activities to a minimum during 1933. Asia was the field of greatest activity in exploration during the year, and there was a revival of interest in the Antarctic. The expeditions to the Arctic and Antarctic regions are discussed under the title **POLAR RESEARCH**. Anthropological and archaeological investigations are described under their separate headings.

ASIA. Soviet expeditions continued their geological and geographical researches in the little known regions of northern Asia. Another expedition of the Soviet Academy of Sciences returned in the autumn of 1933 from the Pamir-Tadzhikistan region. They explored about 100,000 square kilometers, discovering at Karamazar in northern Tadzhikistan important bismuth and radium deposits. Tin deposits were discovered on the northern Turkestan ridge and gold in the eastern Pamirs. The expedition erected a meteorological station on the Fedchenko glacier at a height of 4300 meters and climbed Stalin peak (24,384 feet), the highest peak in the Pamirs. Another Soviet expedition under the engineer Fedortsov explored the "Tas Kkayakhtakh," so-called "white spot" of Yakutia. They discovered an uncharted mountain range and located deposits of valuable minerals.

An exhaustive study of Central Asia, which threw fresh light on the history of the continent, was ended by Dr. Sven Hedin's Sino-Swedish Expedition in 1933 after six years in the field. Dr. Hedin himself returned to Central Asia toward the end of the year, after reporting on some of his discoveries in the United States. The expedition began its work with a staff of 27, 75 servants, and 300 camels. Splitting up into small units, it explored and charted a large section of Inner Mongolia and Central Asia. At the beginning of 1933 only a few units were still in the field. Early in the year Dr. Erik Norin, geologist, returned to Peiping from Northern Tibet, where he had spent the previous eight months working at an average height of 18,000 feet. He made a special study of the glaciers which during the Ice Age filled a large part of Tibet and the valleys of the Karakorum. Melting, they formed the great inland Tarim Sea, of which only a few "wandering" lakes remain.

Another member of the expedition, Dr. Folke Bergman, found numerous remains of the Han period, including more than 10,000 Han scripts inscribed 2000 years ago on wooden strips. Dr. Birger Bohlin returned to Peiping from Northwest Kansu and Koko Nor. During his three years' study he found numerous animal, fish, insect, and plant fossils formed 20,000,000 years ago in the Mesozoic period. His researches indicated that the uplifting of the great Central Asian plateau occurred in comparatively recent times. A third member to return to Peiping during 1933 was Dr. Nils Hoerner, who reported new discoveries concerning the lost city of Edsina, mentioned as a flourishing city in Marco Polo's annals.

On May 15, 1933, Dr. Norin left Peiping again to search for Dr. Nils Ambolt, geodasy expert of the expedition, who had gone into Chinese Turkestan in 1929 and failed to return. From wild Turki tribesmen of southeastern Turkestan, Dr. Norin learned that Dr. Ambolt was safe and was traveling south through Tibet to India. Dr. Ambolt reached the Indian coast safely in midsummer. On the

latter stages of his trip into Turkestan, Dr. Norin traveled by camel caravan for three weeks without meeting a human being along the northern tip of the Asai Dam, a vast region of desert and salt swamp at an elevation averaging 10,000 feet. He found wild camels, horses, and other animal life fairly plentiful. He had a narrow escape from the Turki tribesmen, who believed him to be a Russian and prepared to execute him in revenge for the activities of White Russians in Chinese employ who had suppressed Turki uprisings. Dr. Norin's return to Peiping early in December, 1933, coincided with that of Gerard Bexell, a paleontologist and last member of the Hedin group to return. Dr. Bexell had spent four years in collecting fossilized plant and animal remains in the Nan Shan range, Koko Nor, and in Kansu Province. He lost all of his personal possessions to bandits, but returned with 70 cases of fossil materials. During its years of work, the expedition studied earth movements and climatic changes, remains of ancient civilizations, rare fossil plants and animals, and the cult of lamaism. In addition it surveyed and mapped a large area.

A somewhat similar study of the geology, zoology, and geography of the Himalaya region in Northern India was carried on during 1933 by an expedition under Dr. Hellmut de Terra, of Yale University. This party, besides mapping 4600 square miles of territory, found evidence that at least part of the earth movements which raised the Himalayas to their great height occurred subsequent to prehistoric man. A lost tribe of the Reindeer Tungus was found in the Amur region and studied by Ethel Lindgren, an American scientist. The distribution of animal life in the western Chinese provinces and Tibet was studied by a group under F. T. Smith of the Field Museum, Chicago. Traces of a country which existed in the Arabian Peninsula during Babylonian times were unearthed by Dr. R. P. Dougherty of Yale University. The Gangotri glacier in the Tehri district of the Himalayas was explored by a group headed by Marco Pallis, of Liverpool.

British expeditions renewed the assault on Mount Everest during the year. The attempt by a large expedition under Hugh Rutledge to climb the peak failed, although climbers twice ascended to within 1000 feet of the 29,141-foot summit. The expedition took more than 100 porters with 14 tons of equipment and a long train of baggage animals 300 miles through rough country to the foot of Mount Everest. They successfully established camps between 18,000 and 27,400 feet, three-fourths of the party working for two weeks above 23,000 feet. Four men climbed to about 28,000 feet, only to be turned back by new snow on the sloping slabs of the couloir below the final pyramid. However the summit of Everest was flown over for the first time on April 3 by two British airplanes, the *Houston-Westland*, manned by the Marquess of Clydesdale and Col. L. V. S. Blacker, and the *Westland-Wallace*, carrying Flight Lieutenant D. F. McIntyre and S. R. Bonnett, photographer. A second flight over the peak was made April 20. Excellent photographs were obtained.

AFRICA. The little-known Auenat region of Cyrenaica was studied and surveyed by an Italian expedition, which mapped some 100,000 square miles. A party of South Africans left Cape Town in a motor caravan to explore the Kaoko Veld region of Southwest Africa, reputed to be the place where elephants betake themselves to die.

The Martin Johnsons continued their explorations in Africa, making use of airplanes. They were joined for a period during the year by F. Trubee Davison, president of the American Museum of Natural History, with his wife and four sons.

SOUTH AMERICA. The search for Col. P. W. Fawcett, the explorer who disappeared in the Brazilian wilderness in 1925, was continued during 1933 by a Swedish expedition. A party under Commander G. M. Dyott explored some of the interior valleys of Ecuador and lived for a while among the communistic Shuaros Indians. Representing the Carnegie Institution of Washington Earl Hanson traveled 20,000 miles in South America, investigating the behavior of the magnetic needle in the equatorial regions. A Brooklyn Museum Expedition under Desmond Holdridge explored and mapped some of the Amazon delta islands. Two American women, Marian Gillespie and Violet Ohlsen, traveled among the Jivaros of Ecuador. Other researches were conducted by Dr. W. A. Archer of the National Museum, Washington, in northwestern Colombia and by Amos Berg, for the Chilean government and the National Geographic Society (United States), in Patagonia.

NORTH AMERICA. A party of nine mountain climbers and geologists from the United States explored the Fairweather Range on the Alaskan coast during the summer. Three members of the party—H. Bradford Washburn Jr., Walter Everett, and Robert H. Bates—ascended to within 500 feet of the summit of Mount Crillon (12,725 feet), the highest coastal peak in the world. All nine members climbed Mount Dagelet and three other unnamed and previously unscled peaks in the range. Making an airplane flight over Yakutat Bay, they photographed the glaciers and peaks of St. Elias range and Mount Logan for the first time. The other members of the group were Charles S. Houston, William S. Child, Adams Carter, Richard P. Goldthwaite, Russel Dowie, and Howard Platts.

An air expedition led by C. J. Hubbard, Jr., explored the interior of Labrador in search of gold, but reported largely negative results. They took numerous aerial photographs of the region. The periodical epidemics among rodents of the Hudson Bay region were studied by Dr. R. G. Green of the University of Minnesota, Mrs. Green, and Dr. J. Allen, pathologist of the Province of Manitoba. The isolated Utah-Arizona border country was explored by a party under A. F. Hall, chief forester of the National Park Service, to determine whether the region should be made a national park. An expedition under R. Stuart Murray and George Witten entered the mountain region of southeastern Honduras to make anthropological and ethnological studies of the Indian tribes. Two other parties were in Honduras during the year. One under Gregory Mason, University of Pennsylvania, studied the apes of that region. The other, including W. D. Strong, Alan Paine, and Norman Haskell, of the Smithsonian Institution, searched for evidences of Mayan culture.

OTHER LANDS. In April an expedition sponsored by the American Museum of Natural History, led by Austin Rand, entered the jungles of New Guinea. In October they reported reaching Mount Albert Edward in the interior, a place never before visited by white men.

OCEANOGRAPHY. Of outstanding interest were the submarine explorations of the Sir John Murray Expedition, under Col. Seymour Sewell, which

sailed from Alexandria, Egypt, in the Egyptian government fishery vessel *Mabahiss* on September 3 and arrived in Bombay, Dec. 8, 1933. Oceanographic investigations were carried out in the Red Sea, the Gulf of Aden, the Arabian Sea southeast of Socotra, the Arabian coastal waters from the Kuria Muria Islands to Ras el Hadd, the Gulf of Oman, and that part of the Arabian Sea north of a line between Ras el Hadd and Bombay. A large area of the ocean bed was surveyed by means of an echo-sounding apparatus, which took soundings at the rate of about 27 a minute. The soundings revealed some 10 submarine ranges running across the Gulf of Aden in a northeasterly-southwesterly direction. Between India and Arabia to the south of the Makran-Baluchistan coast were found two submerged mountain chains and a raised plateau. One mountain range rose in places to a height over 10,000 feet above the general level of the ocean bottom. The expedition discovered two zones—one in the Red Sea and the other in the Gulf of Oman—in which there appeared to be little if any animal life.

Soundings in the Pacific revealed new knowledge of the contour of the ocean floor. Capt. C. B. Mayo, U.S.N., on the oil tanker *Ramapo*, obtained a sounding of 5542 fathoms near the Japanese coast 250 miles southeast of Yokohama. A greater depth has been recorded in only one place, the Emden Deep, of 5900 fathoms. Near Vancouver Island Capt. R. B. Horner, U.S.N., discovered an uncharted peak rising 1000 fathoms to within 60 feet of the surface. Another submarine peak, found 150 miles southwest of Monterey Bay, Calif., was 10 miles long and rose about 7500 feet from the ocean floor. The waters around Puerto Rico and the Virgin Islands were explored by a Smithsonian Institution party under Dr. Paul Bartsch on the yacht *Caroline*. See GEOGRAPHICAL SOCIETY, AMERICAN; GEOGRAPHIC SOCIETY, NATIONAL.

FAIRCHILD, BLAIR. An American composer, died in Paris, France, Apr. 23, 1933. He was born at Belmont, Mass., June 23, 1877, and was graduated from Harvard University in 1899. Simultaneously with his academic studies at Harvard he took courses in composition under Paine and Spalding and later studied piano with Buonamici in Florence. In 1901 he entered the diplomatic service, being successively an attaché at the American legations in Istanbul and Teheran. Influenced by the Arabic-Persian school of music, he decided to devote himself entirely to composition and in 1903 went to Paris for further study under Widor and Ganaye. Thereafter he resided alternately in Paris and New York City, and during the World War was Paris representative of the American Friends of Musicians in France.

In his compositions Fairchild incorporated many of his Eastern impressions, both as to atmosphere and musical cadence. Outstanding among these was the ballet-pantomime, *Dame Libellule*, in which on its première at the Opéra-Comique in 1921 was said to have been the first work of an American composer produced there. He wrote also the symphonic poems, *East and West*, *Zal*, and *Shah Péridouin*; *Tamineh*, a sketch

after a Persian legend, for orchestra; *Légende* and *Étude Symphonique*, for violin and orchestra; the Bible lyrics, *From the Song of Songs* and *David's Lament*, for soprano solo, chorus, and orchestra; *Six Psalms*, for soloists and chorus a cappella; *In Memoriam*, for mixed chorus a cappella; the song cycle, *Stornelli Toscani*, and such songs on Oriental themes as *A Bagdad Lover*, *Five Greek Sea Prayers*, and *Les Amours de Hafiz*; two novelettes, for string quartet; six esquisses, for violin and piano; a violin sonata; two piano trios; a piano quintet; and two fugues for organ. Among his arrangements were *Twelve Persian Folksongs*.

FALKLAND, fôk'land, **ISLANDS**. A group of British owned islands in the South Atlantic Ocean about 300 miles east of the Strait of Magellan, consisting of East Falkland, with adjacent islands, 2580 square miles; West Falkland, and adjacent islands, 2038 square miles. Total, 4618 square miles. The total area of the dependencies of the Falklands, including sea, is over 3,000,000 square miles. South Georgia, an island about 800 miles southeast of the Falkland group has an area of 1000 square miles and is the only part of the dependencies which is permanently habitable, the inhabitants being engaged in the whaling industry at Grytviken Harbor. Other dependencies are the South Shetlands, South Orkneys, Sandwich group, and Graham Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. Population (census of 1931), 2392, exclusive of the whaling settlement of South Georgia which had 562 inhabitants including one female. Stanley, the capital and chief city, had 1213 inhabitants in 1931.

Sheep raising, whaling, and seal hunting are the principal occupations. A total of 615,766 sheep were pastured on about 2,248,000 acres of land in 1932. Imports in 1932 were valued at \$422,163; exports, \$1,895,420. In 1931 there were 165 vessels aggregating 252,974 tons that entered the harbors. Total revenue (1932), £115,909; total expenditure, £98,463; public debt—nil. A governor administers the colony assisted by an executive council of 3 official and 1 unofficial members, and a legislative council of 4 official and 2 unofficial members. Governor in 1933, Sir James O'Grady.

FARNAM, HENRY WALCOTT. An American economist, died Sept. 5, 1933, in New Haven, Conn., where he was born Nov. 6, 1853. He attended Yale University (A.B., 1874; A.M., 1876) and then studied at the Universities of Berlin, Göttingen, and Strassburg, receiving the degree

of R.P.D. (Doctor of Political Science) from the latter in 1878. After spending two years as tutor he was appointed in 1880 professor of economics at Yale College, where over a period of four decades he made his influence felt as one of the most eminent authorities on insurance and other economic problems in the United States. From 1881 to 1903 he held a corresponding chair at the Sheffield Scientific School of Yale University. He then became a collaborator in, and from 1909 to 1916 was chairman of, the department of economics and sociology of the Carnegie Institution of Washington. He was also president of the American Association for Labor Legislation during 1907-10 and of the American Economic Association during 1910-11. Appointed Roosevelt exchange professor at the University of Berlin in 1914, he was prevented from attending on account of the outbreak of the World War. He retired as professor emeritus in 1918.

A pioneer in civil service reform, Dr. Farnam served as chairman of the New Haven Civil Service Board from 1898 to 1899 and as president of the Connecticut Civil Service Association from 1901 to 1923. He was also a prohibition advocate, editing while a member of the Committee of Fifty John Koren's *Economic Aspects of the Liquor Problem* (1899). From 1887 to 1909 he was chairman of the Connecticut Commission of Sculpture. He served as associate editor of the *Yale Review* (1892-1911) and of the *Economic Review* (1911-12) and was a member of the supervising board of the *American Year Book* (1910-30). Among his works were *The Economic Utilization of History* (1913) and *Shakespeare's Economics* (1931) and, in German, *Die innere Französische Gewerbepolitik von Colbert bis Turgot* (1878); *Die Amerikanischen Gewerkschaften* (1879); and *Deutsch-Amerikanische Beziehungen in der Volkswirtschaftslehre* (1908).

FAROE, fär'ô; fär'ô, **ISLANDS**. A group of 21 islands, midway between the Shetland Islands and Iceland, owned by Denmark. Area, 540 square miles; population (1930), 24,200. Thorshavn, the capital, had 3200 inhabitants; Klaksvig, had 1409. Sheep raising and fishing are the principal occupations. Administration is under a prefect named by the King of Denmark. There is a local parliament (Lagting) of 21 elected members, which elects 1 representative to the Danish Landsting (upper chamber). The people elect 1 member to the Danish Folketing (lower chamber). The Faroe Lagting elected in January, 1932 comprised 11 unionists, 8 autonomists, 2 social democrats. Prefect in 1933, H. Ringberg.

FARRINGTON, OLIVER CUMMINGS. An American geologist, died in Chicago, Ill., Nov. 2, 1933. He was born at Brewer, Me., Oct. 9, 1864. On his graduation from the University of Maine in 1881 he taught science for several years in various Maine academies. He received his Ph.D. degree from Yale University in 1891 and two years later was appointed an assistant in the United States National Museum in Washington. In 1894 he was called to the newly-established Field Museum of Natural History in Chicago as curator of geology, building up its collection of gems, gem minerals, and meteorites during the next 40 years to one of the finest in the United States. He led several expeditions for the Field Museum, the most notable being that of 1922-23 to Brazil, whose interior was found to be rich in unworked mines of diamonds, emeralds, and topazes. From 1894 to

1904 he was also lecturer on mineralogy at the University of Chicago.

Dr. Farrington was a collaborator in the arrangement of the mines and mineralogy exhibition at the Paris Exposition of 1900 and a member of the International Jury of Awards at the Louisiana Purchase Exposition of 1904. During 1915-16 he was president of the American Association of Museums. His publications included *Gems and Gem Minerals* (1903) and *Meteorites* (1915).

FARRINGTON, WALLACE RIDER. An American publisher and ex-governor of Hawaii, died in Honolulu, Oct. 6, 1933. He was born at Orono, Me., May 3, 1871. On his graduation from the University of Maine in 1891, he started his newspaper career as a reporter on the Bangor (Me.) *Daily News*. During 1892-93 he was reporter for the *Kennebec Journal* in Augusta, Me., and in 1894 managing editor of the Rockland (Me.) *Daily Star*. In the latter year he went to Honolulu where he became editor of the *Pacific Commercial Advertiser* and president of the Hawaiian Gazette Co. From 1899 to 1912 he was editor of the *Evening Bulletin* and president of the Bulletin Publishing Co., Ltd. On the merger of this paper with the Honolulu *Star* he became vice-president and general business manager of the Honolulu Star-Bulletin, Ltd. At the time of his death he was president of the company.

Appointed governor of Hawaii by President Harding in 1921, Mr. Farrington served in that capacity, through reappointment by President Coolidge, until 1929—the only person to hold that office for two successive terms. During his administration he strove especially for racial amity in the islands. He was also an advocate of better educational opportunities for all the children of Hawaii, serving on the Territorial Board of Education and acting during 1909-11 as chairman of the Territorial School Fund Commission. He was chairman of the board of regents of the College of Hawaii and in 1932 president of the Pan-Pacific Union. As an appendix to Alexander's *History of the Hawaiian Revolution* he wrote *Review of the Revolt of 1895*.

FASCISM. Addressing the National Council of the Italian Fascist party in 1933, Mussolini declared that fascism "has ascended from the national plane to the world plane. . . ." On Oct. 27, 1933, the 11th anniversary of the Fascist march on Rome, he said: "The world of doctrines, against which . . . fascism rose is retreating and capitulating everywhere. In Italy it is now far away and obliterated even in memory." The capitulation to fascism of more than 70,000,000 persons in Germany and Austria during 1933 and its permeation into numerous other countries the world over appeared to confirm Il Duce's statements.

Before fascism's violent assaults, the principles of democracy, individual liberty, and minority rights appeared almost everywhere to be losing ground. The Communist wave, which after the World War seemed about to sweep over Europe and other parts of the world, was likewise placed on the defensive by Fascist movements which owed much of their strength to the Communist menace. The sudden upward surge of fascism during 1933 was attributed by Harold Callendar, writing in the *New York Times*, to "the inability (so far) of governments to solve the great economic problems of our time; to the industrialists' fears of socialism or communism; the desperation of the lower middle classes and farmers; the restlessness of youth, now largely

unemployed; the failure of internationalism in both the economic and the political spheres; the instinctive tendency of the masses to oversimplify all social problems, to distrust thought and scholarship as such and to demand instead action—even, or perhaps particularly, violent action."

EUROPE. Under the impulse of Fascist victories in Germany and Austria, and often aided by high-pressure Nazi propaganda, fascism made rapid strides during the year in many countries of eastern and central Europe. The dissolution of the Fascist Iron Guard association by the Rumanian government was followed by the assassination of Premier I. G. Duca by a member of the organization on December 29. The police arrested 1400 members of the Iron Guard the following day. Hungarian Fascists inaugurated anti-Semitic excesses in Budapest and Debrecen Universities in November, 1933, but the riots were ended by the police. Active Fascist movements developed among German-speaking minorities in Czechoslovakia, Switzerland, Austria, Denmark, Belgium, the Netherlands, the Saar, Danzig, and Memel. The Czechoslovak government banned the Nazi organizations on October 4 and the Dutch and Danish authorities were forced to take similar action.

Half a dozen Nazi organizations sprang up in Switzerland, but their excesses, the demonstrations by German Nazis across the border, and the report of a German military plan for the invasion of Switzerland alienated the Swiss and the Nazis lost out to the Socialists in several municipal elections. Fascism in Belgium found its main strength among the Flemish separatists. They demanded an autonomous Flanders from which Communists, Jews, and the French-speaking Walloons were to be excluded. The Austrian Nazis, swearing allegiance to Hitler and to the Anschluss movement, waged a desperate battle to overthrow Chancellor Dollfuss's newly proclaimed "Catholic fascism." At the end of the year they seemed on the verge of success. Groups allied to the German Nazis captured control of Danzig and Memel but were forced to retain representative forms of government. By a campaign of terrorism and effective propaganda, the Nazis likewise were gaining the upper hand in the Saar.

As in many other non-German countries, the Fascist agitation in Scandinavia was said to be financed and directed in large part from Germany. Under the influence of Hermann Goering, Nazi Premier of Prussia, fascism gained some strength in the southern provinces of Sweden. The movement split into pro-German and anti-German factions on the proposal to hand over the northern section of Sweden to German colonization. Former Defense Minister Vidkun Quisling headed the Norwegian National Union, a Fascist group which secured some 30,000 votes in the October parliamentary elections. The Lapuan (Fascist) movement in Finland, which in 1931 and 1932 seemed ready to overthrow the government, lost ground to the Socialists in the 1933 elections, probably due to the almost complete eradication of communism in previous years and to subsequent Fascist schisms. In the small Baltic states a vigorous Nazi propaganda was maintained. Estonia late in the year adopted a new constitution which embodied many Fascist conceptions of government. The legal abolition of the citizenship of the Jews was sought by the Latvian Nazi organization. The Lithuanian government had for several years been a dictatorship of pronounced Fascist tendencies.

While the other western European states appeared relatively less vulnerable to the Fascist attack, they were by no means immune. The National Guard, a private military organization of Fascist complexion organized in the Irish Free State, made such progress that it was banned by the De Valera government. Gen. Owen O'Duffy, leader of the movement and former chief of the Free State police, was arrested on December 17 on a charge of wearing the blue shirt emblematic of his organization. The only important Fascist movement in Great Britain was that led by Sir Oswald Mosley. His "Black Shirt" organization, moulded on the Italian model, was said to have enrolled several hundred thousand young men. In France the Camelots du Roi, a royalist organization, and several other groups perpetrated anti-Semitic acts of violence and agitated for a "totalitarian state."

THE AMERICAS. In the United States orthodox fascism made little apparent progress during 1933. The Khaki Shirts of America, led by Art J. Smith, announced from their Philadelphia headquarters a plan for a Columbus Day "march on Washington" by 1,500,000 Fascists, for the purpose of establishing President Roosevelt as a dictator. The "march" proved a fiasco. Police raided the organization's offices on October 12, arresting 25 on charges of violating the State Firearms Act, inciting to riot, and disorderly conduct. Smith, arrested four days later, was charged with converting the funds of the organization to his own uses. A more able Fascist propaganda organization was established during the year in New York under the leadership of Lawrence Dennis, a former Foreign Service officer. Meanwhile there was speculation in some quarters whether President Roosevelt's "New Deal" would not prove the precursor of a Fascist state. An investigation into Nazi propaganda in the United States was carried on by Representative Samuel Dickstein of New York. He charged that the German government had appropriated funds for the dissemination of Nazi propaganda in America.

A more pronounced trend toward fascism was noted in several Latin-American countries, where Fascist semi-military groups were organized to defend constitutional or semi-dictatorial régimes against threatened Leftist revolts. In Chile an armed civilian law enforcement organization of some 50,000 members, called the "Milicia Republicana" or "White Guard," made its appearance during the year and did much to strengthen the position of President Alessandri's constitutional government. Its leader was Eulogio Sánchez Erázuriz. Another Fascist group, which adopted the name of the German Nazis or National Socialists, was also organized in Chile. Both groups declared their support of the government and their opposition to communism. In Argentina, the Legion Civica Fascistica, uniformed in gray shirts and Sam Browne belts, enrolled more than 10,000 members to oppose the powerful Radical and Socialist parties. In August a "black shirt" Fascist organization was launched in Peru. It was reported that extensive Nazi propaganda was carried on from the various German legations and consulates in South America (*New York Times*, Jan. 30, 1934).

ASIA. Japan had several Fascist organizations which developed great strength during 1933. For a time it was feared that they would attempt a *coup d'état* against the government, but toward the end of the year their power showed strong

evidence of decline. Chief among these groups was Kenzo Adachi's National People's League, which had 33 of the 466 seats in the Lower Chamber of Parliament. In China a Fascist organization, garbed in green shirts, was organized by Marshal Chiang Kai-shek in support of his Nationalist government and to oppose the spread of communism.

For a more detailed description of Fascist movements in the various countries, see ITALY, GERMANY, AUSTRIA, RUMANIA, CZECHOSLOVAKIA, SWITZERLAND, DENMARK, BELGIUM, the NETHERLANDS, the SAAR, DANZIG, MEMEL, SWEDEN, NORWAY, FINLAND, ESTONIA, LATVIA, LITHUANIA, IRISH FREE STATE, PORTUGAL, YUGOSLAVIA, BULGARIA, ARGENTINA, CHILE, and JAPAN under *History*; COMMUNISM.

FEDERAL ALCOHOL CONTROL BOARD. See PROHIBITION; UNITED STATES under *Administration*.

FEDERAL CAPITAL TERRITORY, AUSTRALIA. A territory of 940 square miles within the state of New South Wales, containing Canberra the capital of Australia. The population (exclusive of full-blood Australian aborigines) at the June, 1933 census, was 8947. See AUSTRALIA.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. An organization established in 1909 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1933 it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention; Free Baptists; Seventh-Day Baptists; General Council of the Congregational and Christian Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; United Brethren in Christ; United Presbyterian Church of North America; United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council coöperates in certain specified areas of work.

In June, 1932, the United Church of Canada affiliated with the Federal Council. This was the first time that a denomination outside the United

States entered into official relationship. The total number of local churches included in the Council's constituency, according to the *Yearbook of the Churches*, 1933, was 112,915. Clergymen numbered 135,833, while the total communicant membership (persons 13 years of age or over) was 22,177,622. Coöperating with the Council were such agencies as the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Foreign Missions Conference of North America, and the International Council of Religious Education.

The work of the Council was carried on during 1933 by the following departments under the direction of the executive committee: Evangelism; social service; research and education; race relations; international justice and good will; relations with churches abroad; radio; and field. The official organ is the *Federal Council Bulletin*, a monthly. The department of research and education published a special study on radio broadcasting, while the department of international justice and good will issued a study course for use by young people, entitled *Men Conquer Guns*. The department of relations with churches abroad shared in the Universal Christian Council for Life and Work, held at Novi-Sad, Yugoslavia, in September, 1933.

At the Council's biennial session held in Indianapolis in 1932 the Rev. Albert W. Beaven, president of the Colgate-Rochester Divinity School, was elected president and the Rev. Lewis Seymour Mudge, stated clerk of the Presbyterian Church in the United States of America, vice-president. The general secretary is the Rev. Samuel McCrea Cavert. National offices are at 105 East Twenty-second Street, New York City. Regional offices are maintained in the Woodward Building, Washington, and at 77 West Washington Street, Chicago.

FEDERATED MALAY STATES. A number of states forming a large part of the Malay Peninsula, under the protection of Great Britain. They are:

State	Sq. mi.	Pop. (1931)	Capital
Perak	7,875	765,989	Taiping
Selangor	8,195	533,197	Kuala Lumpur
Negri Sembilan	2,573	283,799	Seremban
Pahang	14,006	180,111	Pekan
Fed. Malay States	27,649	1,713,096	Kuala Lumpur

The population of the chief towns (1931 census) was: Kuala Lumpur, 111,738; Ipoh, 53,863; Taiping, 31,881; Seremban, 21,650; Klang, 20,913; Kampar, 15,301; Teluk Anson, 14,671. The 1931 population of the Federated Malay States included 443,618 Malays, 150,113 other Malaysians, 711,540 Chinese, 379,996 Indian, 6350 Europeans, and 17,222 others. Port Swettenham is the chief port. In 1931 there were 1249 schools with a total average attendance of 80,295.

PRODUCTION. The principal agricultural products are rubber, coconuts, rice, oil palms, pineapples, and tapioca. The cultivation of rubber and the mining of tin are the chief industries. Timber, gutta-percha, gums, oils, resins, and canes are products of the forests. In 1932 the production of timber, firewood, and charcoal amounted to 4,561,237, 7,348,287, and 763,863 cubic feet solid respectively.

COMMERCE AND FINANCE. Excluding bullion and specie, imports for 1932 were valued at £8,298,886 (£12,390,142 in 1931) and exports (including reexports) at £10,249,316 (£14,604,001 in 1931). Revenue in 1932 amounted to S\$43,817,151; expenditure S\$53,740,139; public debt on Jan. 1, 1933 amounted to S\$96,185,174 (Straits dollar averaged \$0.404 for 1932).

COMMUNICATIONS. Railways, which are government owned or controlled, extended 1089 miles in 1931. There were 2866 miles of surfaced highway and 152 miles of unsurfaced highway in 1932; also 1644 miles of bridle roads and paths. Shipping entered and cleared at Port Swettenham during 1932 aggregated 5,925,736 tons.

GOVERNMENT. The states are governed by the Federal Council in matters common to the four states. State councils legislate in individual state matters. The Federal Council consists of the Governor of the Straits Settlements (who is *ex-officio* High Commissioner) as President, 13 government officials, and 12 unofficial members who are nominated by the High Commissioner with the approval of the King of England. There is a native ruler, assisted by a British Resident, in each of the four states. High Commissioner in 1933, Sir Cecil Clementi. See BRITISH MALAYA.

FEISAL. King of Iraq, died at Berne, Switzerland, Sept. 8, 1933. He was born at Taif, Arabia, May 20, 1885, the third son of Hussein Ibn Ali (1856-1931), first King of the Hejaz and descendant of Fatima, daughter of the Prophet Mohammed. After being reared as a Bedouin he was taken at the age of seven to Constantinople where he was educated in private schools and served in the Ottoman Army, rising to the rank of general. He took a leading part, with his brothers Ali and Abdullah, in the Young Turk movement which led to the deposition of the Sultan, Abdul Hamid II, in 1909. During 1911-13 he commanded an Arab contingent in the operations of the Turks against the Idrisi, a religious sect which threatened to overthrow the emirate of the Hejaz, to which his father had been appointed with the title of Grand Sherif of Mecca. In 1914 he was elected to the Turkish Parliament as deputy for Jidda, identifying himself thereafter with the Arab Nationalist party which envisaged an Arab empire freed after 600 years from Turkish control.

During the early part of the World War Feisal was stationed at Damascus under the surveillance of the Turkish governor of Syria, but in 1916 he escaped to the Hejaz and assumed command of the rebels at Medina. The moving spirit behind this revolt was Col. T. E. Lawrence of the British Military Intelligence who assisted Feisal, after his initial defeat, in uniting the desert tribes into an effective army. After moving northward along the Red Sea coast for 500 miles, conquering the territory through guerrilla tactics, Feisal established his headquarters at Akaba where his army served as protection for the right wing of the Egyptian Expeditionary

Force under Allenby, enabling it to occupy Jerusalem on Dec. 9, 1917. The Arab and British armies then advanced side by side from their respective bases, entering Damascus on Oct. 3, 1918, amid the general rejoicing of the Arab population. The story of this colorful campaign was told by Colonel Lawrence in *Revolt in the Desert* (1927).

After the Armistice Feisal set up in eastern Syria a provisional military administration, and, with Colonel Lawrence, represented the Arabian cause at the Paris Peace Conference. In March, 1920, he was proclaimed King of Syria by a Syrian National Congress, but as he was unable to curb the attacks against the French mandatory power he was deposed in July by General Gouraud who had defeated the Arabs outside of Damascus. The British government, however, was willing to satisfy to a certain extent Feisal's ambition for the establishment of an Arab state and in 1921 placed him on the throne of Iraq and his brother Abdullah on that of Transjordan. Although a constitutional monarchy was established in 1923, Iraq was administered under a British mandate until its admission to the League of Nations in 1932.

In August, 1933, while on a holiday in Europe, Feisal was recalled to Iraq on account of a rebellion of the Assyrian minority. He subsequently returned to Switzerland to take a cure, but worry over his country's unsettled condition contributed to his sudden death. He was succeeded as king by his son Ghazi.

FELLOWSHIPS. See UNIVERSITIES AND COLLEGES.

FELS PLANETARIUM. See ASTRONOMY.

FENCING. Spurred on by the interest shown in the Olympics, fencing in 1933 reached its highest peak, as a sport, particularly in the United States. With more active participants than ever before and with the national outdoor championships staged as one of the attractions of the Chicago Century of Progress Exhibition, several new tournaments were introduced, including a national outdoor sabre tournament, several outdoor competitions for women, and the women's intercollegiate event.

Joseph L. Levis, representing the Boston Athletic Association, who placed second in the foils, in the 1932 Olympics, higher than any of his mates, retained his national foils title and in addition to taking this most coveted title also won the outdoor championship at Chicago. He turned back Hugh Alessandrini, of the Fencers Club, New York, and Frank S. Righeimer, Jr., of Chicago, indoors, and outdoors bested Righeimer and Miguel A. de Capriles, of the University Fencers Club, who finished second and third.

Dr. John R. Huffman, of the New York Athletic Club, also repeated as champion, retaining his national indoor sabre title, but placed second to Norman C. Armitage of the Fencers Club in the outdoor competition. Huffman, however, led the New York A. C. team to the national team title. The epee crown was won by Lieut. Gustave M. Heiss, of the U. S. Army, and Righeimer won outdoors. Heiss led the Fencers Club to the national epee team title.

New York University became the first New York institution to dominate the intercollegiate championships, held in Philadelphia. New York University took three of the team titles, foils, sabre, and three-weapon, and placed its captain, Jose R. de Capriles, as individual epee champion.

Charles Abuasheritz of Yale University captured the sabre award.

The fencing-through champion Miss Dorothy Locke, of the Salle d'Armes Vince, took the women's national indoor championship, but was topped outdoors when Miss Helene Mayer, former German and Olympic champion, who applied for United States citizenship after the 1932 Olympics, and who lives now in Los Angeles, won. Miss Locke was second. The Salle d'Armes Vince team of Miss Locke, Miss Marion Lloyd, former champion, and Miss Muriel Guggolz, won the team title. The New York University fencers also had their own way in the women's ranks, winning the team honors and the individual crown when Miss Frances Siegel won.

FERTILIZERS. The total consumption of fertilizers for the year in the United States again was considerably below normal. According to the National Fertilizer Association heavy losses were sustained by many fertilizer companies during the year. In the early part of the year fertilizers were sold at prices less than the cost of the materials of manufacture. However, the fall tonnage reflected a renewed interest on the part of farmers due to better farm products prices. It was estimated by the National Fertilizer Association that farm products prices advanced to 70 per cent of prewar and fertilizer prices to 77 per cent of prewar which was considered a favorable relationship. According to the Bureau of Chemistry and Soils the expenditures for fertilizers during the past two years decreased less than expenditures for labor, feed, or farm equipment. This was considered to indicate in general the basic importance and absolute necessity of fertilizers in maintaining soil productivity, quality of farm products, and low production costs. The tag sales in 12 Southern States for the first 11 months of the year were 16 per cent larger than for the same months of the previous year. Sales for the same 11 months period in five midwestern States were 14 per cent larger than for the first 11 months of the previous year. The October tag sales especially reflected this increase. According to the United States Department of Commerce, fertilizer consumption in Germany, where it is used more extensively than in any country of similar size or larger in the world, increased nearly 10 per cent during the year. Consumption of all fertilizers was not only well maintained, but the increase therein was notable for the first time since the beginning of the depression, especially with reference to superphosphate. The demand for superphosphate was favored by the scarcity of basic slag caused by the inactivity of the steel industry. The improved consumption was due in large degree to the measures instituted by the Reich government in connection with the fertilizer syndicates for overcoming credit difficulties resulting from the adverse financial situation of German farmers. These included the creation of a special credit guarantee fund and the granting of prior liens upon farm crops for payments due on account of fertilizer sales designed to protect fertilizer sellers against credit losses. A further factor in the fertilizer trade expansion was the growing realization by farmers that, even in the face of a depressed market for agricultural products the application of fertilizers was profitable. Official figures on Italian fertilizer consumption during the year also showed important gains in the use of all fertilizers. The production of superphosphate in Italy during the

first quarter of the year registered a gain of 62 per cent over the output for the same period of the preceding year. Phosphate exports from Tunis in northern Africa were considerably in excess of production during the first five months of the year and showed a gain of 31 per cent over the previous year. Morocco phosphate deliveries increased markedly during the first half of the year. Domestic production of superphosphate declined during the year in Great Britain as did also the imports and consumption. Spanish potash exports increased markedly during the year and phosphate rock production in Algeria, the third largest North African source of supply, netted a gain of 54,000 metric tons for the first seven months of the year over the corresponding months of the preceding year. Potash consumption was relatively well maintained in Great Britain during the year.

Owing to the continued acuteness of the competition in international trade in fertilizers and the increased necessity for retrenchment, several of the larger producers of fertilizer materials both in the United States and in foreign countries renewed reorganization and consolidation activities and several fertilizer producing nations took additional governmental action to rehabilitate and protect their industries. The Spanish Nitrogen Commission proposed that the state promote nitrogen production in sufficient quantities to supply the entire domestic demand. Under this proposal imports would be subject to control and permits would be assured only upon presentation of evidence that a proportionate quantity of national products had been previously acquired. Sales prices for imports would include a tax to compensate domestic producers. The plan also contemplated a maximum sales price equivalent to 25 per cent over the average prices prevailing in the interior of Germany, France, and Italy. If the plan should become effective the price of nitrogen to farmers would increase 65 per cent.

Reorganization of the Chilean nitrate industry was proposed in a bill submitted to the Congress by the Chilean President. This would establish a monopoly for the sale of nitrate and iodine through a single sales corporation which would acquire all stocks existing on July 1, 1933, and the subsequent output of the nitrate industry. The sales corporation would have a directorate of 12, of whom three would be appointed by the President and the remainder would be elected by the majority of producing enterprises. Stocks of nitrate now held abroad would be acquired by the sales corporation for the sum of obligations which such stocks now guarantee, the payment of which would be assumed by the corporation. The price of nitrate and iodine produced after July 1, 1933, would be its industrial cost at nitrate ports, exclusive of depreciation of machinery, the depletion of lands, and the interest and service on debts. To this cost would be added \$1.50 United States currency per metric ton subordinated to the prior service of the bonded indebtedness of the corporation. The selling corporation would fix the selling prices and the sales quotas of producers. During the year the nitrate and iodine industry was required to pay to the government the sum of 140 million pesos. After July 1, 1933, the net profits of the selling corporation would be distributed 25 per cent to the government and 75 per cent to the producers. An executive decree, dated July 31, 1933, canceled all concessions obtained from the Chilean government for the ex-

ploitation of Chilean guano deposits. This action was considered to be in line with the government's plans to establish a guano monopoly under the control of the state in order to exploit the deposits more scientifically and supply cheaper fertilizers for domestic consumption.

A price agreement, reached by the Chilean and Belgian nitrogen producers at a meeting held in August, 1933, stipulated that the price of Chilean nitrate on the Belgian market will be maintained at 12.5 francs per 100 kg. more than the official prices of Belgian ammonium sulphate.

In Japan the Department of Commerce and Industry proposed, according to the U. S. Department of Commerce, to exercise control over fertilizer materials prices and to regulate exports for the purpose of safeguarding Japanese markets abroad. Although the production of ammonium sulphate within the Japanese Empire almost trebled during the past four years the domestic supply could not meet the demand during the year and the government undertook fundamental measures to cope with the constant shortage resulting from the decrease of imports due to adverse foreign exchange and the controlled marketing policies of domestic producers. Prices fell after the government suspended the fertilizer import license system during December, 1932, but not in proportion to the decline in farm products prices. As a temporary measure the government planned to subsidize foreign imports to the extent of 20 yen per ton.

The Italian government announced the formation of a nitrogen committee under the Ministry of Corporations. The functions of the committee were outlined as (1) to ascertain periodically domestic consumptive needs for nitrogenous products; (2) to check periodically available supplies of nitrogenous products of domestic manufacture; (3) to regulate imports of foreign nitrogenous products by means of import licenses and by authorizing business firms or other bodies to buy and sell such products on terms to be established by the Committee; (4) to authorize warehousing of stocks of imported nitrogenous products; and (5) to adopt whatever measures may prove necessary to assure supplies of nitrogenous products for Italian agriculture and industry.

After more than five months of intensive work by the Fertilizer Recovery Committee of the National Fertilizer Association, the Code of Fair Competition for the fertilizer industry of the United States was approved by the National Recovery Administration and signed by the President of the United States on Oct. 31, 1933. The purpose of the Code is "to aid in eliminating from the fertilizer industry destructive and unfair methods of competition, waste, and improper practices, to place the industry upon a sounder basis, and better enable it to serve labor and agriculture by bringing about higher wages, shorter working hours, better living conditions for employees, fair prices, and high quality products for the farmer, and reasonable profit for the producers of fertilizer and to the industry generally." To further the policies of the Code a fertilizer recovery committee was designated to cooperate with the National Recovery Administration as a planning and fair practice agency for the fertilizer industry. This committee consists of not less than 12 representatives of the fertilizer industry. Three members without vote may be appointed by the President of the United States. The Code establishes minimum wage rates for fertilizer

factories by zones and also hours of labor for various conditions of production. The National Fertilizer Association pointed out that operation of fertilizer plants under the Code will add more than \$4,000,000 per year to the total payroll of the fertilizer industry. However, since labor costs represent a relatively small percentage of the cost of a ton of fertilizer the increased cost to farmers will be moderate. The Code fully recognizes the rights of farmers' cooperative organizations in their production, in their purchases of fertilizer from manufacturers, and in their sales to members, including the distribution of patronage dividends. A voluntary plan also is provided for reducing the number of grades offered for sale, through cooperation with official agricultural workers. Provision is made for conferences between control officials, agronomists, and fertilizer manufacturers in each State or zone for the purpose of deciding what grades should be offered for sale. After the list of grades is decided upon the sale or offer for sale of any additional grades is considered a violation of the Code. Unfair methods of secret rebating and other unfair business practices in the industry are prohibited by the Code. For purposes of administration the United States is divided into 12 trade zones, in each of which a fair practice and planning committee is to be set up.

The development of better methods of fertilizer production continued, and the fertilizer industry was taking advantage of these developments in spite of continued general world overproduction and low consumption. The new concentrated materials especially were being adopted. The research programme of the Bureau of Chemistry and Soils was concentrated largely on the development of promising new processes, the improvement of old methods, the investigation of promising raw materials and the determination of the properties and utility of new products suggested for fertilizer use. The Tennessee Valley Authority began the design, construction, and operation of smelters for phosphorus and potash, a research programme on the nature and behavior of fertilizers, a programme of research and development in the manufacture of fertilizers, and the maintenance and operation of Nitrate Plant No. 2 at Muscle Shoals. The position of the United States continued to improve with reference to its supply of raw materials, maintaining its independence in phosphate supplies and reaching a position in regard to nitrogen making it independent of foreign monopoly, according to the Bureau of Chemistry and Soils. The country was about 80 per cent sufficient in its domestic potash supply.

Following two years of decline, world production and consumption of nitrogen showed an upward trend during the year, according to early estimates. European countries continued to increase their facilities for the production of nitrogen. The agricultural consumption of chemical nitrogen in Germany continued to shift from the ammonia to the nitrate forms, including ammonium sulphate-nitrate. The consumption of ammonium sulphate declined to about one-third of its high level, whereas nitrate consumption trebled. To meet this demand a calcium nitrate plant was built at Merseberg and several other plants began the production of synthetic sodium nitrate. The German nitrogen industry reached a capacity to produce over one million tons annually of pure nitrogen. Ammonium sulphate consumption in Great Britain for the first six months

of the year made a new high record, representing an increase of 67 per cent, and facilities for meeting this demand were being increased. Nitro-chalk also was becoming a popular top dressing and its use and facilities for its production increased. Production of ammonium sulphate by 23 companies in Japan was slightly below the level of the previous year, but the prices secured were more favorable.

Progress continued in the development of synthetic fertilizers, especially in the United States, with reference to the fixation of atmospheric nitrogen. There were eight plants operating in the United States with an annual nitrogen capacity of some 275,000 tons according to the Bureau of Chemistry and Soils. Due to the independence of foreign nitrogen monopolies thereby gained the Bureau estimated that the saving to farmers in the cost of nitrogen in fertilizers amounted to \$125,000,000 during the period 1924-32. However, the imports of nitrogenous fertilizer materials into the United States during the first nine months of the year showed an upward trend in practically all classes, indicating a growing market.

The work of accumulating information regarding the catalysts and catalytic reactions involved in atmospheric nitrogen fixation continued. An important conclusion from the year's work was that the rate at which ammonia is formed on a catalyst depends on the rate at which nitrogen is absorbed by or reacts with the surface atoms of the iron catalyst.

Additional information was revealed concerning the physical constants of gases and fertilizer salts. In connection with the gas purification process which precedes the catalytic conversion to ammonia and byproducts the Bureau of Chemistry and Soils determined the solubility of hydrogen in water over a temperature range of from 0° to 100° C. and up to 1000 atmospheres pressure. Similar measurements were made on nitrogen from 25° to 100°. Mathematical treatment gave added importance to these compressibility data by developing precise methods for calculating quantities such as high pressure specific heats, entropies, and coefficients of expansion for both measured ranges and higher temperatures and pressures.

On the synthesis of urea from ammonia and carbon dioxide further information was obtained. This process was put into commercial operation at one plant in the country and the product was being employed in the preparation of mixed fertilizers. As a result of this process, urea is now obtainable for fertilizer purposes for about 4 cents a pound, according to the Bureau of Chemistry and Soils, whereas previously it was far too expensive for such use. Laboratory investigations by the Bureau on the conversion products obtained in the synthesis of urea furnished data indicating the conditions necessary for the separation of urea from the unconverted ammonia, carbon dioxide and other products. The relatively low vapor pressures of the mixtures with excess ammonia present and the low freezing point indicated the possibility of transporting the liquid for use in the preparation of mixed fertilizers. A solution of this character modified by the addition of water, thus further reducing the vapor pressure and freezing point, was being produced commercially for the direct ammoniation of superphosphates. The process for the treatment of peat with ammonia to form a product with a nitrogen content in some cases as high

as 20 per cent, part water soluble and part water insoluble, was developed during the year. The nitrogen content of the product increased with increased temperature of heating. A maximum nitrogen content was obtained with peat containing about 10 per cent of moisture. The product obtained possesses general physical characteristics which indicate its value as a conditioner of mixed fertilizers. The abundance and cheapness of both peat and ammonia give promise of its commercial production at a price comparable to that of organic nitrogen carriers. In connection with the fixation of nitrogen in the soil by natural agencies, information continued to accumulate regarding the properties of the nitrogen fixing enzyme present in *Azotobacter*. It was shown to be active only at a pH above about 6.0. The knowledge of the stimulating action of humates on nitrogen fixing bacteria was enlarged and new and improved methods were devised for the preparation of synthetic and natural humates containing various metals. Information accumulated on the direct combination of nitrogen and organic compounds indicating that nitrogen in an activated form combines with certain types of substances to yield a variety of highly nitrogenous bases.

The status of domestic potash materials gave promise that a serious shortage is unlikely to occur, although the United States continued to be dependent largely upon imports. Particular attention was devoted during the year to the provision of cheap potash for the Middle West and Northwest from the abundant volcanic lavas of Wyoming. Methods were under development providing means for the combination of potash and phosphates as potassium phosphate in a form which carries a low distribution charge because of its high plant food concentration. Substantial improvements were made in the processes of extracting potash from the more abundant potash materials by the application of various commercial acids. The potentialities of smelting methods applied to a mutually fluxing mixture of potash and phosphate rock were greatly enhanced by the substitution of local coals for coke heretofore considered essential to the process. Advances continued in the technology of potash recovery as a by-product of cement manufacture. It was estimated by the Bureau of Chemistry and Soils that the potash now allowed to go to waste in this industry amounts to approximately 85,000 tons of K_2O annually in normal years.

The world production and consumption of superphosphates appeared on the increase during the year. The German superphosphate industry increased its production during the year, reaching an estimated capacity of 600,000 tons. This was aided by an increased import duty of 1.5 marks per 100 kg. An extensive study of the occurrence, production, reserves, and chemical composition of phosphate rock in the United States was completed and published by the Bureau of Chemistry and Soils. Efforts were continued in the United States to develop methods for more economically converting phosphate-bearing minerals into suitable available fertilizer materials with the conservation of important by-products. The treatment of phosphate rock with phosphoric acid seemed to offer the best means of utilizing phosphoric acid produced by acid decomposition and furnace processes. The best conversion of the phosphate rock into available forms was obtained with acid containing approximately 50 to 65 per

cent H_3PO_4 . It was possible to eliminate the fluorine from phosphate rock completely by heating the rock at approximately $1400^\circ C$. in an atmosphere of steam in the presence of small quantities of silica. Removal of the fluorine resulted in the conversion of the phosphate into available forms. Improvement in blast furnace methods of phosphate smelting during the year consisted of an increase in the temperature of the hot blast of about $500^\circ F$., which resulted in a saving of fuel and reduced the cost of phosphoric acid. The Tennessee Valley Authority announced on Oct. 12, 1933, the expectation to have plans completed within three months for a phosphoric acid blast furnace to make phosphatic fertilizer on a commercial scale.

The Department of Agriculture and the State Agricultural Experiment Stations continued the experimental testing and comparison on prominent soil types of new concentrated fertilizers with fertilizers of ordinary strength. Considerable improvement occurred in the quality and mechanical properties of fertilizers, particularly those of higher analysis. In this connection the addition of dolomite to a fertilizer mixture was found to reduce its acid forming tendency and decrease its solubility. The development of the mechanical placement of fertilizers continued.

BIBLIOGRAPHY. Current progress is recorded in *The Fertilizer Review* published by the National Fertilizer Association at Washington, D. C., and in *The American Fertilizer* published in Philadelphia, Pa. Statistics of the fertilizer trade and industry will be found in reports of the United States Department of Commerce. FIJI, fē'jē, ISLANDS. An archipelago of about 250 islands (80 inhabited), forming a British Crown colony, about 1100 miles north of New Zealand. The two largest islands are Viti Levu (4053 square miles) and Vanua Levu (2130 square miles). Rotuma (area 14 square miles; population about 2200), an island lying about 220 miles north of the main Fiji group, is also included in the colony. Total area, 7083 square miles; population on Jan. 1, 1932 was estimated at 185,573 including 93,414 Fijians, 76,722 Indians, 5058 Europeans, 1441 Chinese, and 8938 others. Suva, the capital, on the south coast of the island of Viti Levu, had 12,982 inhabitants in 1921, including 1741 Europeans. Government assisted schools (154) had an attendance of 12,048 students in 1931.

Bananas, coconuts, maize, sugar cane, tobacco, rice, pineapples, cotton, and timber are the main products. In 1932, imports were valued at £857,346; exports, £1,698,964, including sugar (raw) 131,302 tons valued at £1,289,239, copra totaling 15,076 tons valued at £170,240, and 340,968 bunches of bananas valued at £67,235. Total tonnage entered and cleared the ports in 1931 aggregated 1,263,772 tons. There are 300 miles of railway, including a narrow gauge railway of 120 miles from Tavua to Sigatoka. Fiji has direct cable communication with Canada, Australia, and New Zealand; and also direct wireless communication with Australia.

Government revenue was £547,461; expenditure, £528,604; public debt, £1,091,404; for 1931. The Governor, appointed by the King of England, administers the colony assisted by an executive council and by a legislative council consisting of partly nominated and partly elected European, Indian, and native members. The Governor is also High Commissioner for the British islands of the Western Pacific. Governor in 1933, Sir A. G. M. Fletcher.

FINANCE. See **FINANCIAL REVIEW**; **PUBLIC FINANCE**, and sections under *Finance* in Countries and States.

FINANCIAL REVIEW. Significant alterations of far-reaching influence in their effect on private—as on public—finance were characteristic of the year 1933. The preceding twelve months had brought the community to low point of discouragement; and values generally to the bottom of their cyclical movement. At the opening of 1933, therefore, the question whether it would be possible to bring the downward movement to a close, and to initiate some upward trend was a general, if not universal, preoccupation in the American financial community. Everywhere, there was a willingness to submit to drastic measures, if only for the sake of trying an experiment, and "getting something done." It was in such a situation that the new national administration took office; and almost at once was forced to face the state of things caused by the closing of practically the entire body of banks of the United States.

The restoration of payments on the part of the banks gave to the public a fictitious confidence that something was actually being sought, or was contemplated, for their relief; and this tended, during the latter part of the month of

March, to bring about a distinct tendency for the better on the New York market, and to some extent, in the other stock markets of the United States. The better trading thus established was accompanied by larger manufacturing activity, due, in no small measure, to the exhaustion of stocks of goods throughout the country, and thus, during the late spring and early summer, there was a business boom which, in the financial field, took form partly as a larger volume of trading, and partly as a higher range of prices for stocks.

The summer boom did not last long, but was halted by the middle of August, and predictions that this recession would soon pass with the resumption of business activity after Labor Day were not verified. Recession, both in production, consumer-buying and securities-issuing and trading continued throughout the remainder of the calendar year. This reaction was variously described, and was the more regrettable because in foreign countries, and particularly in Great Britain, there appeared to be a distinct turn for the better which indicated to some observers as much as a 25 per cent recovery from the low point of the depression.

The fact that the United States, after seeming about to join the van of the recovery, had sunk back again was ascribed very generally to the adoption of the control of industry embodied in what was called the National Recovery Act adopted by Congress in May, 1933 and aiming at strict regulation of hours, wages, and trade practices. Unquestionably, the effect of this Act was to cause considerable unsettlement and uncertainty in business, and thus to bring to a standstill the beginnings of greater activity which had made their appearance as the result of the flush of hope which the community had felt with regard to national policies under the new national administration.

Whatever may have been the truth, the recession threatened to reduce both conditions in the financial market, and the volume of employment of labor, to the old level of business, and such a result was averted mainly by the adoption on the part of the government, of measures designed to bring about the distribution of immense sums of money either for public works, needless public buildings, subsidies to farmers or direct relief to needy persons. The consequences of this policy were of course to develop an immense deficit on the part of the United States Treasury, to establish an artificial and unwholesome industrial condition, and to tend to make many persons and businesses dependent upon government largesse. Nevertheless, the policy must be admitted as having tended to create at least a statistically better condition of affairs, and thus to have enabled business and finance to exhibit a better superficial appearance than they would otherwise have been able to show.

The adoption during May, of the so-called Securities Act on the part of Congress, with a view to repressing some of the grossest of the abuses from which the public had suffered during the era of dishonesty prior to 1929, however, neutralized, so far as the financial community was concerned, some of the influences otherwise likely to have made themselves felt; and, during the past six months of the year, was responsible for practically terminating the business of issuing new securities. That branch of financial business accordingly, as distinct from speculation and trading, reached low point during the year

1933; and much of the business previously transacted in the New York market returned to London, whence it had been attracted during the preceding decade.

The changes thus initiated partly through government financial policy, and partly through legislation, were consequently of the most far reaching nature so far as the ultimate development of the markets of the United States is concerned. It is, as yet, too soon to appraise with accuracy, their final results, though there can be little doubt of the nature of the trend of Stock Exchange activity. Transactions of the New York Stock Exchange for the twelve months included 604,816,452 shares of transfers of stocks as against 425,235,294 for 1932, and 526,921,426 for 1931. Total bond sales were \$3,217,566,000 as against \$2,973,725,895 in 1932 and \$3,075,347,100 the year previous. Although at times, there were trading days of great activity the business was fairly well distributed and on few occasions were there abnormal volumes of transfers. Trading as already incidentally noted, tended, to some extent, to be seasonally concentrated, but there was little overconcentration otherwise. Taking the year as a whole, there were some 75 three million share days, 52 with four millions, 34 with five millions or over, and 1 with nine million.

It was still true that a great deal of business on the exchange was of a nature that grew out of the difficulties of financial institutions. Embarrassed banks and trust companies closed at the time of the bank holiday, or in process of reorganization thereafter, found it expedient to dispose of their holdings with a view to bettering their position, and not a few from time to time, found it practically unavoidable thus to relieve themselves. On the other hand, much selling took place on behalf of foreigners who, distrusting the future monetary policy of the United States, endeavored to transfer their funds to foreign countries, as well as a good deal of selling of like sort for the account of Americans who, in similar wise, endeavored to find a supposed safety for their accumulations. The earnings of stock exchange firms were materially better than in 1932 owing to the few months of midsummer prosperity, but in many cases were far from being satisfactory.

Seats did not average so low as in the preceding year, but low point for 1933 was \$90,000 and the price did not improve as had been expected, the best value paid for the twelve-month being \$250,000. More consolidations and failures took place, and there was a distinct tendency toward shrinkage in the personnel of the brokerage community. Not a few concerns cut their staffs by serious percentages and the number of branches again underwent reduction. During mid-year there was some gain. The number of offices open at the close of the year was 1215 as against a total of 1171 at the opening of 1933.

The trend of prices on the Exchange was, generally speaking, consonant with the tendency of business change. From January to about the end of March, a period of doubt and recession coincided with the last weeks of the Hoover administration, and reflected the doubts regarding the policies of the new management, which were partly resolved by what was considered a courageous way of meeting the opening difficulties of the early weeks of March, when the banks were closed throughout the nation. Stock averages, which, at the opening of January, were 56.33 stood

at 45 three months later while bonds had indicated no tendencies of a convincing sort toward recovery.

The improvement of business-demand, and the enlargement of manufacturing partly, it seemed, for the purpose of anticipating the restrictions upon manufacturing hours and wages later to be established, gave a renewal of courage to trades, and a considerable increase of speculative demand ensued. This was intensified by the fact that the administration early committed itself to what was termed inflation, abandoned the gold standard and accepted the idea of debasement of the dollar in foreign exchange through the imposition of strict control of transfers in foreign trade and an absolute prohibition of exportation of gold. All this tended to stimulate the notion that debasement of the currency would be reflected in advances of stock prices.

It should, normally, have had a reverse effect upon bond values, but in fact the combined prices of triple "A" bonds never varied more than a few points either way. The higher values of stocks, which attained considerable proportions during midsummer, speedily fell off during the late weeks of the season and again during the autumn, so that stocks closed the year at an average of 86.02 with bonds at 73.03. The result was discouraging to the inflationist school of thought, as it proved impossible to trace a direct connection between stocks and bonds on the one hand, and inflation policies on the other.

The banking situation was favorable to stock operations during the year, and many institutions did their best to improve values by making credit as cheap as possible. The National Administration plainly favored, if it did not support, an attitude on the part of Reserve banks which was at least complaisant toward speculation, notwithstanding the threats constantly uttered against the Stock Exchange and its members.

Nevertheless, the advance of loans on securities, and particularly of brokers' loans, was slow, and at no time more than moderate. Total such loans in reporting Member banks had stood at \$3,751,000,000 at the opening of January, and at the end of December was only \$3,620,000,000. Brokers' loans, for the same periods stood at \$394,000,000 and \$801,000,000 respectively.

The advances of the Reconstruction Finance Corporation were moreover continued on an extensive basis, with new appropriations from Congress during the year, the result being to keep not a few enterprises from financial embarrassment. At no time, did there appear to be any lack of stock exchange credit or any high charge for it, so that from this side the year was favorable to a broadening of operations. It was, however, evident, throughout, that the general public was still reluctant to engage in open market operations, believing as it did that it had not been fairly treated during the new era period of manipulation prior to 1929, and clearly feeling that conditions were still deeply unfavorable to the general public, owing to the doubtful character of the business situation.

The year must therefore be regarded, so far as stock exchange trading is concerned, as having been still a period of clearing-up and adjustment, rather than a time during which new positions or constructive policies were under advisement. In such circumstances profits of brokers, especially that part of their income usually derived

from the advancement of substantial sums to margin-traders was greatly reduced.

STOCK EXCHANGE AND INVESTMENT BANKING INVESTIGATION. During the year 1932, the Senate Banking Committee had undertaken some hearings intended, at first, to ascertain reasons for "short selling," and the depreciation of stock values on the New York Exchange. After the beginning of 1933, these hearings broadened considerably, and took shape as an investigation into bank manipulation, pool operations by bankers, and, to a smaller extent, transactions by corporation heads, who operated in the market on the strength of "inside" knowledge. Much time was devoted to the methods which had been employed by brokers and bankers in marking off their income tax liabilities. The outcome was a series of revelations regarding market operations by conspicuous figures which, although not particularly novel to the well-informed, advertised widely the methods that had been pursued by not a few of the more prominent men in Wall Street.

Most of what was done appeared to have the color of legality, and the single prosecution for income tax invasion that was undertaken by the government, resulted in an acquittal. However, the effect of the inquiry undoubtedly was to stimulate legislation. Among the more important results in this field, was the adoption of the so-called Securities Act, which prescribed heavy penalties for misstatement on the part of issuers of securities, and subjected the entire business of underwriting to unusual restrictions. At the same time, the Banking Act of 1933 (urged for some two years preceding as the so-called "Glass bill") was pressed forward to adoption on the strength of the disclosures developed in the investigation. The Banking Act of 1933 contained important limitations and restrictions upon the lending of Federal Reserve funds or the overengagement of member bank resources in stock exchange operations.

A final outcome of the operations of the committee in question was the naming of a commission by the Department of Commerce under instructions from the President (it was understood), charged with the mission of inquiring into what changes if any, ought to be prescribed by law in the methods actually pursued by the Stock Exchange in establishing the rules governing trading on the part of its members. The vague, and at times, alarmist, reports of the deliberations of the committee, and the forecasts of its probable investigations, while not, up to the close of the year, authenticated in any respect,

nevertheless, had an unfavorable influence upon the tone of the market, and tended to cause doubt and uncertainty on the part of many stock exchange houses who unavoidably tended to think of their business as unstable, and on the verge of attack in some unknown way at the hands of the Federal Government.

Then, too, the atmosphere of scandal and criticism which enveloped the entire financial community during much of the year, naturally reacted strongly against the restoration of any healthy or normal tone in the day-to-day trading. It was still uncertain, at the close of the year, just what concrete results would actually be produced by these investigations and by the legislation of the year in so far as directed against the exchange and its members, but there was still wanting concrete evidence of benefit.

NEW ISSUES. It was in the field of new issues that the year 1933 seemed to bring the most disastrous reaction. The Securities Act, as we have seen, had brought a feeling of apprehension and well-warranted doubt on the part of bankers, and underwriters, which doubtless had a powerful effect against any real rejuvenation of the market. What was more influential probably, however, was the fact that business conditions remained so unsettled, due to the interference of the government under its National Recovery Programme that the offering of new issues with any assurance of favorable reception, was open to the greatest doubt. Accordingly, the new issue business, already at low ebb during the final months of the Hoover régime, tended still lower from and after the first months of 1933, and touched the lowest level yet attained toward the close of the year.

Even the satisfactory flotation of refunding issues, on behalf of unquestionably solvent concerns was exceptionally difficult. Government financing tended more and more to occupy the attention of the banking and financial communities; and, due to the indisposition of the Treasury to undertake any thorough refunding programme, most such issues were made on a short-term basis, and were dumped directly into the banks. The result was to cut off a good deal of private financing that would otherwise have been needful, the various concerns getting their supplies for the Treasury through the Reconstruction Finance Corporation, while the Treasury sold government notes and bonds to supply the need. Thus, much ordinarily private financing passed into the hands of Reserve banks as Treasury issues.

MOVEMENT OF GOLD. The year 1933 was an un-

precedented period in the history of the gold stock of the United States. For a twelvemonth the outflow and inflow of the metal had been portentous, yet at the opening of 1933 the country and the Federal Reserve system stood possessed of nearly the largest stock of gold ever held by them, respectively. Aggregate ownership of gold by the nation was fully 40 per cent of the entire monetary gold stock of the world, at the same time that the banking portfolios of the country were becoming gradually frozen. There had, moreover, sprung up a popular agitation against the gold standard, which was especially severe in the farming districts.

The new administration was strongly urged before it took office, by organizations both of business men, and of farmers, to assume a position hostile to gold, and this it undertook to do. When the bank holiday became a necessity, it was promptly extended to the Reserve banks which were authorized to refuse gold payment on their obligations and to maintain this irredeemability, even after the other banks had been nominally opened. This decision was moreover, promptly followed by the Act of June 2, which repudiated gold obligations of the United States, forbade the use of the gold clause in contracts, and made all forms of currency legal tender. It was a remarkable adoption of the idea of repudiation and abandonment of solvency as previously known. It had been preceded by a definite embargo on gold, so that movements into the country were greatly reduced, and those out of the country disappeared except so far as taken from previously earmarked funds.

Inward movement such as remained, became, to no small extent payments made for the purpose of refining, and hence subject to withdrawal, since foreign countries knowing that they could not withdraw goods freely, naturally sought to find other means of settling obligations in the United States. The habit of depositing gold and other funds in New York banks as a place of safe-keeping which had been greatly developed before 1929, and had only moderately been interfered with after that date, now became completely obsolete, and such funds began once more to flow toward London, as in past years.

Foreign countries ceased to pay debts in gold, although some of them, despite the repudiation of our own gold obligations, continued to settle their obligations in the United States at the gold equivalent of the face of the debts they had undertaken. This, for instance, was true of the French railways.

Germany and other large debtors, on the other hand, found it increasingly difficult to provide dollar exchange, and ceased to pay in gold or gold equivalent.

Practically all foreign debtors including Great Britain, which had kept up the installments on her governmental war debt, began to default, or to adopt a policy of making merely nominal settlements as a "token" of indebtedness. Others in which we possessed large corporate indebtedness, due us as in the case of various South American states, and sundry of the European nations including Germany, began to impose foreign exchange "controls," or in not a few cases, to declare moratoria or to default, without further explanation. These factors all influenced the movement of gold, and reduced the sums imported.

^a Gold released from earmark at Federal Reserve banks less gold placed under earmark. ^b For explanation of this figure, which is derived from preceding columns, see *Bulletin* for July, p. 423. ^c Allowance has been made for gold earmarked at the Bank of England for account of the Federal Reserve Bank of New York. ^d Differs from Department of Commerce figure since \$8,900,000 declared for export on February 2nd was not actually taken from the Federal Reserve Bank of New York until March 1.

in the international trade of the United States had been developed during the years since the panic of 1929. These were partly the result of the commercial tactics of foreign countries, partly of the excessive tariff rates levied by the United States itself, partly the outcome of current monetary and banking conditions. They had caused a severe downward movement of goods imports, while on the other side, the cessation of foreign lending on a large scale, which was due to a feeling on the part of American investors that they were already too heavily committed abroad, led at the same time to a discontinuance of large portions of the export trade.

Revival of this trade upon some reasonably sound basis was accordingly a feature of the campaign of 1932, and the early months of the new administration brought many promises and forecasts of reciprocity treaties and other trade agreements. The London Economic Conference which had been set for June 12, 1933, was regarded as the date at which definite action would be taken for the purpose of assuring a better trade and tariff relationship between the United States and other nations. Meantime however, a new policy—that of commercial nationalism—had been adopted by the government of the United States, and when the London Conference reached the point at which it was prepared to take tentative action looking to some agreement, the disappointing news that the Washington authorities had concluded not to consent to monetary stabilization (which was regarded and had been announced at Washington during the spring months as a necessary prerequisite to any trade improvement) practically deferred to an indefinite future any real measures looking to commercial adjustment.

A "tariff truce" which had been concluded with Great Britain just before the London sessions, was revoked during the autumn, by the British authorities, and the close of the year found the nation further off, probably, from any definite trade accommodation than had ever before been the case. Meantime, export business had fallen to a low ebb at mid-year. The growing depreciation of the currency early in the autumn, and

throughout the latter months of the year, however, gave the temporary fillip to trade which is usually administered under such conditions. As a result, there was improvement in the statistical showing.

Moreover, the movement of capital abroad, at the instance of American owners anxious to place their funds in greater safety, took the form, in many cases, of purchases of staple goods which were shipped to foreign ports, there to be sold and placed in warehouse pending the sale for cash, which could then be placed on balance with British and other banks. This factor, coinciding with the currency depreciation, had a powerful influence in altering the apparent balance during the later months of the year, and giving a false appearance of recovery which was not merited by the actual conditions. The background of this situation, which formed the basis for developments in 1933 is afforded by the international balance sheet for 1932, which is shown in the following table.

UNITED STATES BALANCE OF INTERNATIONAL PAYMENTS IN 1932

[In millions of dollars]

Item	1931 (revised)			1932

Total capital movements	- 491	- 154
Unestimated items, errors, omissions, etc. *	+ 165	+ 114

* This item consists roughly of 3 parts: (1) exports and imports of goods for which data are available but not recorded in the official trade figures (e.g. ships, bunker fuel sold in the United States, silver, etc.); (2) goods whose export or import is wholly or partly omitted from official trade data (e.g. unrecorded parcel-post shipments, goods smuggled into the country, etc.); (3) corrections of certain recorded trade figures to allow for possible overvaluation (in case of goods sent on consignment) or undervaluation (in case of imports subject to ad valorem duties), uncollectible accounts, etc.

* These figures include several small items which are, strictly speaking, of a capital, rather than current, nature; for example, receipts of principal on war debt account, and unestimated portions of several items in Government transactions such as payments by the Alien Property Custodian. On the other hand, gold exports and imports, which ordinarily may be considered as current outgo or income, are classified separately because of the "noncurrent" nature of a great part of the gold exports during 1932.

* This figure represents the net change in the country's short-term position during the year. Data on gross movements are not available and would serve no particular purpose. The net change in 1932 is determined by deducting the year's decline in United States balances held abroad from the decline in foreign balances held here.

* This item takes account of all security movements between the United States and foreign countries and includes international sales and purchases of long-term issues, new underwriting, sales and purchases of properties not represented by security issues, and security transfers resulting from redemption and sinking fund operations.

* An unestimated part of this item is accounted for by the year's net change in outstanding commercial accounts abroad—presumably a net collection in 1932—of American exporters. The remainder, it must be assumed, is the net result of errors and possible omissions or duplications.

The export and import movement of the nation by months is presented in the table on page 265.

FOREIGN EXCHANGE. The extraordinary demoralization of the foreign exchange markets, which had been characteristic during 1932 had reached what seemed to be "peak" point, with the advent of the new national administration in the spring of 1933. Throughout the world, the appearance of moratoria on foreign transfers, foreign exchange controls, appropriation of all

exchange originating domestically, and in some cases the assumption by central governments of responsibility for colonial or other debts, had caused a confusion of currency values and an inability to collect, or bring home funds, admittedly due to individuals and corporations, but for the time being in foreign hands, was an outstanding factor which strengthened the demand for a settlement of international currency controversies and conditions at the London Conference.

Action on the part of the United States in abandoning the gold standard and placing an embargo on gold followed by the repudiation of gold obligations through act of Congress brought the position of the United States to an acute point before the middle of 1933, and greatly added to the confusion in foreign exchange. Inasmuch, as practically all countries save France, Holland, and Switzerland had now left the gold standard, most of the exchanges of the world were carried on between irredeemable paper currencies and

quotations assumed the erratic and unaccountable trends which in such conditions have always been manifest. The situation, during the second half of the year, began to assume difficult aspects, which suggested a possible necessity on the part of France for abandonment of the gold standard with the other gold standard countries probably following her example.

Great Britain had, early in the year, adopted a fairly definite policy of attempting to control

* Preliminary.

the currencies of all countries which either possessed as their own, or were in the habit of using, British sterling as the foundation of their exchanges into a joint "sterling bloc" whose exchanges ought to move in harmony. A so-called "currency war" was threatened when the United States in October announced an intention of fixing the price of gold for itself each day and attempting to make this price effective through purchase operations in the London market. Although the amounts of gold so bought were carefully kept secret, they are well understood to have been only nominal and the chief effect of the policy was apparently that of depreciating the dollar in terms of sterling and francs still further.

As the French government fell further into arrears, with its incomes, the danger of budget difficulties, possibly resulting in gold standard abandonment, followed by further devaluation of the franc made its appearance as an eminent possibility. The complex forces thus acting upon the franc and the pound sterling sometimes offset those proceeding from the dollar variations and sometimes tended to intensify them. In the absence of information as to the sums expended, and policies definitely followed by the Bank of England and the Federal Reserve system in attempting to control foreign exchange, explanations of exchange movements are still obviously theoretical. The main currents of exchange are afforded in the table on page 266.

COMMODITY PRICES. The electoral contest of 1932 had been made to centre in the United States about the question of commodity prices and the best methods of raising them and the new administration had undertaken the definite task of restoring the price level of 1926—as frequently and positively stated by President Roosevelt in addresses to the public during the summer of 1933. Much of what was done in a monetary way was accordingly conceived with the distinct idea of acting upon the price level. The abandonment of gold was accompanied by action in Congress authorizing the President to reduce the weight of the gold dollar to an extent not greater than 50 per cent, while at the same time permission for the coinage of silver at a ratio to be named by the executive was granted, and at the same time provision was made for the issue of three billion dollars of "greenbacks," or legal tender notes.

While, up to the close of the year, none of these grants of power had been employed there was constant promise or threat of inflation, and continuous attempt to bring about artificial

increase both by monetary means and by the application of policies of reducing acreage, destroying crops, and killing animals—the products in large measure to be thrown away or distributed as charity. Notwithstanding these attempts to raise prices, the outcome was singularly unsuccessful, partly due, it would seem, to poor distribution of purchasing power, partly to inept management of the forces in operation, and partly the result of misunderstanding of currency theories and erroneous expectations of their working out.

Accordingly, the course of prices followed an uneven route, and sometimes appeared likely to register decided advance, while at others recession impended or actually took place. The net outcome was a moderate advance in wholesale quotations of possibly 15 per cent—considerably less than was witnessed in some foreign countries where no inflation methods had been resorted to. The truth was that many articles had already touched bottom in world trade, and were about ready to move upward, at least moderately.

One factor which needs to be considered in studying American prices for 1933 is the circumstance that some of the administration's policies quite notably operated to defeat others, as was the case, for instance, with the opposite effects of its inflation methods and its raising of costs under the National Recovery Plan. This opposition of policies at times was so pronounced as to give rise to widespread comment, even among those who were engaged in the management of the economic policies of the government. The end of the year found the price trend still uncertain and confused, with no definite certainty of its early destination. The net gain in the Bureau of Labor index for the year was an advance of 15 per cent as compared with a drop of four points the year before. Wheat prices stood (for No. 2 Red) at \$1.02½ in New York as against \$0.92½ a year earlier, while corn was 63½ cents against 40 cents in 1932. Cotton was .1030 cents against .0610 for middling upland at the end of 1932, while family beef closing at around \$11.50 showed a loss of about \$1.50 from twelve months earlier. Pork which had been \$14.28 at the beginning, rose to \$17.00 at the close, of 1933.

MONEY RATES. Efforts to maintain "cheap money" at reserve banks and thus to influence the general adoption of cheap money policies continued during 1933, following the programme of the preceding year, and at no time did the official rate show much correspondence with real or true rates. The latter were in fact high, and in many cases—as for instance, for loans on domestic dwellings—nearly unobtainable, even at

the time when Reserve banks were quoting 2½ per cent. The low rates thus nominally kept up did not help the business man, nor did they stimulate the offering of commercial paper for discount, but such paper notably declined in volume during the year. Rates were further cut as compared with the beginning of the year, by several of the Reserve banks, and at the close of the period had reached a level of 2 and 2½ per cent according to location.

The Reconstruction Finance Corporation, in line with the general anxiety to demonstrate the existence of low rates likewise cut its rates finally to 4½ per cent. Acceptance rates continued low and tending downward. At the end of the year, most open market rates were close to an all time low, and the government was finding it possible to borrow as low as a fraction of 1 per cent on its short paper, while the two and one-quarter one-year Treasury notes issued at the end of the year, to an amount of \$950,000,000 were generally regarded as about ½ to 1 per cent above their true market rate. The Banking Act of 1933, adopted on June 16, had prohibited the payment of interest by banks on demand deposits, and had subjected the interest on time deposits to regulation by the Federal Reserve Board which at once named 3 per cent as the prevailing official rate for such deposits.

Investment returns remained extraordinarily variable. The spring and summer months saw many bonds especially of the second and lower grades, previously quoted at merely nominal figures restored to a price level somewhat corresponding to their original real values, though in many cases still almost unprecedentedly low. High grade bonds continued to yield a low return because of the artificial demand for them created by the continued lack of confidence on the part of the public in other bonds. Banks were still reluctant to invest in a type of security from which they had already suffered so heavily and institutions which were in process of liquidation found themselves practically under the necessity of dumping many securities with bad results so far as quoted price was concerned so that the indicated yield of such issues moved higher and often maintained abnormal levels.

Receiverships were less numerous and in the case of some companies, there was a recovery of balance-sheet position which promised favorable things for bonds, but the latter usually responded only sluggishly, with the result that, in many instances, the actual incomes received by buyers were out of all reasonable proportion to the facts as to probability of continued payment. This disorganization of the investment market which was hardly relieved during the year, left the study of yields as a matter largely of speculation, and often of conjecture, owing to the large number of doubtful issues left open regarding investments, taxation, trade, and real income of corporations.

FINANCIAL SITUATION. See RAILWAYS.

FINE ARTS. See ART MUSEUMS; LITERATURE, ENGLISH AND AMERICAN; PAINTING; SCULPTURE.

FINLAND. A republic of Northern Europe, whose independence was proclaimed Dec. 6, 1917. Capital, Helsinki (Helsingfors).

AREA AND POPULATION. With a land area of 132,589 square miles (18,397 square miles of water), Finland had an estimated population on Dec. 31, 1931, of 3,697,505, compared with 3,403,487 on Dec. 31, 1921. The urban population

in 1931 totaled 707,159, or 19.13 per cent of the total. The movement of population in 1931 was: Living births, 71,866; deaths, 48,968; marriages, 23,856. Emigration in 1932 was 1161 (741 in 1931). The chief cities, with their populations at the beginning of 1932, are: Helsinki (Helsingfors), 260,838; Turku (Åbo), 67,722; Viipuri (Viborg), 59,321; Tampere (Tammerfors), 57,349. Of the 1930 population, 3,022,257 spoke Finnish and 342,916 Swedish. Both are official languages; Swedish names are given above in parentheses. Lutherans at the end of 1931 numbered 3,536,551.

EDUCATION. In 1930, illiterates comprised only 0.9 per cent of the population over 15 years of age. In 1931 there were 5217 primary schools, with 219,756 pupils, and 4608 lower elementary schools, with 108,456 pupils, in the country districts and 1396 higher elementary schools, with 42,874 pupils, in the towns. Secondary schools comprised 133 lyceums, with 39,941 pupils; 80 middle schools, with 9541 pupils; and 57 high schools for adults, with 2869 pupils. The universities at Helsinki (Finnish) and Turku (1 Finnish and 1 Swedish), enrolled 6688 students in 1932. There were in addition various teachers' training colleges, and vocational and professional institutions.

PRODUCTION. The 1930 census showed 59.6 per cent of the population engaged in agriculture and 16.8 per cent in industry, as compared with 65 and 15 per cent, respectively, in 1920. In 1929, there were 285,448 farms, with 5,411,000 acres, covering 6.5 per cent of the total land area, while forests covered 62,500,000 acres, or 73.4 per cent. The forests, chiefly pine and spruce, are the chief source of industrial wealth; 40 per cent of the forest land is state owned. Woodworking, paper, food and drink, machinery and shipbuilding, textiles, leather, clay and stone, light, and power are the chief industries, in order of value of production. The production of chemical woodpulp in 1932 was 870,000 tons (714,000 in 1931); mechanical woodpulp, 176,000 tons (212,000); paper, 335,000 tons (320,000). The gross value of industrial production declined from 13,710,000,000 marks in 1928 to 9,264,000,000 marks in 1931, but rose in 1932 to about 9,800,000,000 marks. As compared with 1931, the output of exporting industries increased about 7 per cent in 1932, while its value was raised by about 10 per cent. The boom in the export industries continued during 1933, Finland being one of the few relatively prosperous countries in a world of economic depression.

The chief crops in 1932, with 1931 figures in parentheses, were (in metric tons): Wheat, 34,300 (30,500); rye, 346,500 (315,200); barley, 174,500 (165,600); oats, 661,000 (669,700); potatoes, 1,005,600 (977,900); and hay, 2,992,400 (2,904,300). Agricultural output, 1932, was estimated at 5,000,000,000 marks (\$77,500,000 at average exchange rate); 1931, 4,400,000,000 marks.

COMMERCE. After declining from 7,001,400,000 Finnish marks in 1929 to 3,464,700,000 marks in 1931, imports rose in 1932 to 3,502,300,000 marks. Exports fell from 6,429,700,000 marks in 1929 to 4,456,700,000 marks in 1931 and then rose to 4,631,500,000 marks in 1932. The favorable trade balance was 1,129,200,000 marks in 1932 (992,000,000 in 1931). The Finnish mark equals \$0.0252 at par and exchanged at an average of \$0.0239 in 1931 and \$0.0154 in 1932. The leading

1932 exports were: Pulp and paper, 2,056,852,219 marks (1,828,009,335 in 1931); timber, 1,657,234,026 marks (1,771,941,183); animal foods, 517,074,855 marks (514,841,930). Imports in order of value were metals and manufactures of metal, colonial produce and spices, cereals, textiles, minerals and earth, chemicals, oils and fats, machinery, and spinning materials. Great Britain was Finland's chief customer in 1932, taking exports to the value of 2,156,369,595 marks (1,991,010,362 marks in 1931); the United States, Germany, and France followed in order. Germany in 1932 supplied imports to the value of 1,002,547,652 marks (1,207,402,676 marks in 1931), followed by Great Britain, Sweden, and the United States.

FINANCE. Closed accounts for 1931 showed gross revenues of 3,975,135,000 marks and gross expenditures of 4,245,600,000 marks. Actual net revenues in 1932 totaled 2,925,100,000 marks and expenditures 3,001,700,000 marks, the deficit being 76,600,000 marks, of which 42,100,000 marks was met out of the balance from previous years. The budget estimates for 1933 were: Revenue, 2,877,362,000 marks and expenditure, 2,877,336,000 marks; for 1934, preliminary government estimates were: Revenue, 3,035,600,000 marks and expenditure, 2,996,600,000 marks.

The public debt on Dec. 31, 1932, totaled 3,471,900,000 marks (foreign funded debt, 2,431,700,000; foreign floating debt, 350,900,000 marks; internal funded loans, 505,300,000 marks; internal short-term credits, 184,000,000 marks).

COMMUNICATIONS. Railways on Jan. 1, 1932, extended 3377 miles, of which all except 158 miles belonged to the state. In 1931, the state railways carried 19,624,000 passengers and 8,522,000 tons of freight; total revenues were 693,454,000 marks; expenditure 608,980,000 marks. Public highways in 1931 aggregated 31,792 miles (main roads, 16,513 miles). An important medium of transportation is the network of lakes and canals, forming 2500 miles of navigable waterways. The merchant marine on Jan. 1, 1933, included 4378 vessels of 538,315 net registered tons. Entrances in the foreign trade in 1932 numbered 8408 vessels, of 5,983,124 tons; clearances, 8519 vessels, of 6,102,135 tons.

GOVERNMENT. Executive power is vested in a president elected for six years by 300 electors, who are chosen by direct election in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The President appoints the Cabinet Ministers and executive decisions are taken in the Council of State formed by the 10 Ministers, who are responsible to the Diet. Members of the Diet are elected for three years by a direct vote of all citizens over 24. President in 1933, Pehr Evind Svinhufvud, elected Feb. 16, 1931. The Cabinet formed Dec. 15, 1932, from a coalition of the bourgeois parties (Agrarians, Unionists, Progressive, and Swedish parties) was headed by Premier Toivo Mikael Kivimäki (Progressive). For changes in 1933, see *History*.

HISTORY

THE DIET ELECTIONS. The triennial election to the Finnish Diet, held July 1 and 3, 1933, was in effect a referendum upon Fascism, which during 1931 and 1932 had grown increasingly aggressive. Two armed Fascist revolts against the government were quelled in 1932 (see 1931 and 1932 YEAR BOOKS). Confident of making decisive gains,

numerous Fascist groups entered candidates in the elections. They suffered a decisive defeat, while the Social Democrats and other Left groups registered striking increases in their parliamentary representation. The two Fascist groups modeled on Hitler's Nazis received a combined vote of 3893 out of 1,100,000 ballots cast. The Lapuan Black Shirts, who united with the Conservative party, fared no better. The combined Lapuan-Conservative vote was 186,824, compared with the Conservative vote of 203,958 in 1930. Of the other Fascist groups, only one—the People's (Crisis) party—secured parliamentary representation. Polling 8549 votes, it seated two Deputies in the Diet. On the other hand the Social Democratic vote rose to 412,759 from 385,820 in 1930 and the Progressives, another Left group, captured 82,476 votes against 65,830 in 1930. The vote of the Agrarian party was 249,086 (308,280 in 1930); Swedish party, 115,385 (122,589 in 1930). The standing of the parties in the new Diet, which convened Sept. 1, 1933, was: Social Democrats, 78 (66 in former Diet); Agrarians, 53 (60); Swedish party, 21 (21); National Union (Conservatives and Lapuan National Patriots), 32 (42); Progressive party, 11 (10); Small Farmers' party, 3 (1); People's party, 2 (0).

COMMUNISTS SPY SCARE. Earlier in the year (May) the Diet had acted to check the growth of Fascist organizations by passing legislation prohibiting political parties from organizing military auxiliaries. The Lapuan and other Fascist movements in Finland had arisen largely as a reaction against aggressive Communist propaganda. The Lapuans succeeded in outlawing the Communist party and driving the movement underground. That communism was not entirely eradicated was indicated during the 1933 elections by the 2000 votes cast for candidates who were nominally non-partisan but actually Communists. In October, the Finnish police uncovered a fairly extensive espionage system, whose members included Marvin Jacobson, a former Detroit school teacher; Mrs. Mary Louise Martin, an alleged Latvian citizen who had lived in the United States; and others. The police charged that the ring had been established by the Soviet government and that it had operated in Finland for three and one-half years through Soviet military attachés.

THE ECONOMIC UPSWING. One factor in the decline of the Fascist movement in Finland was the distinct economic upswing which became evident during 1933. Finland's foreign trade rose about 50 per cent above the 1932 level, although none of the neighboring Scandinavian countries achieved similar results. There was some decrease in unemployment, the total registered in August, 1933, being 15,269, as against 16,966 in August, 1932.

A treaty which was expected to promote foreign trade was signed with Great Britain on Sept. 27, 1933. The United Kingdom granted Finland most-favored-nation treatment, the maintenance of the duty of 10 per cent ad valorem on birch and plywood, a reduction in the duty on wooden sewing thread reels from 20 per cent to 15 per cent ad valorem, and an equitable share in any agricultural import quotas which might be imposed. The British guaranteed that they would import 198,000 hundredweight (of 112 pounds) of butter from Finland annually, regardless of future restrictions. In return Finland agreed to

import at least 75 per cent of its annual coal requirements from the United Kingdom, instead of 29 per cent, as well as certain quantities of flour, creosote, jute, and salt. It promised to admit British coal and coke duty free; to reduce the Finnish tariff on British textiles, herring, tin plate, and many other articles, and to maintain existing duties on another long list of imports from Great Britain. The treaty was to run three years. It was received with mixed feelings in Finland, the fear being expressed that due to the most-favored-nation clause it opened the Finnish market to the cutthroat competition of all the great industrial nations. The British made vigorous efforts to extend their market in Finland during "British Week," held in Helsinki in September. A new commercial agreement with France, designed to aid exports of pulp, paper and boards, was signed early in 1933. Germany, piqued at the Anglo-Finnish treaty, notified Finland on October 24 that it would not renew its trade agreement, which expired Dec. 31, 1933.

Finland was the only nation which paid in full the war-debt installments due to the United States government during 1933. The sum of \$148,592 was paid June 15, 1933, and \$229,623 on Dec. 15, 1933.

FIRE INSURANCE. See **INSURANCE.**

FIRE PROTECTION. The 1933 fire loss is estimated at \$316,897,733 by the National Board of Fire Underwriters, a reduction of 28 per cent from the similar estimate for 1932. This is the lowest loss figure recorded for the post war period, and compares with a peak of \$561,980,751 for 1926.

The loss by months for the past three years is as follows:

COMPARATIVE MONTHLY LOSS ESTIMATES

	1931	1932	1933
January	\$44,090,449	\$39,224,788	\$35,547,565
February ..	41,776,051	39,824,622	36,661,481
March	44,074,362	49,189,124	35,321,248
April	41,423,764	43,822,233	27,825,970
May	37,835,273	39,270,524	24,338,714
June	33,368,378	34,338,670	21,578,609
July	33,024,594	32,982,434	20,004,049
August	31,917,630	31,425,931	23,626,505
September ..	33,202,986	30,972,318	20,447,571
October	35,501,580	30,734,458	21,465,382
November ..	35,287,641	31,167,708	22,454,200
December	40,514,868	39,190,506	27,626,439

Total 12 mos. 452,017,026 442,143,311 316,897,733

Adjusted loss figures 451,643,866 400,859,554

The following table gives the annual fire loss by years since 1916.

1916	\$258,377,952	1925	\$559,418,184
1917	289,535,050	1926	561,980,751
1918	353,878,876	1927	472,938,969
1919	320,540,399	1928	464,607,102
1920	447,886,677	1929	459,445,778
1921	495,406,012	1930	501,980,624
1922	506,541,001	1931	451,643,866
1923	535,872,782	1932	400,859,554
1924	549,062,124	1933 (Est.) ..	316,897,733

Various authorities attribute the 1933 decrease in the national fire losses to different causes. The reduction in burnable material in mercantile and manufacturing occupancies, both in units and dollar value, has undoubtedly been a major factor. It is noteworthy, however, that the initial drop was coincident with the declaration of the bank moratorium and the adoption of the 60-day rule by the insurance companies. The effect of the bank

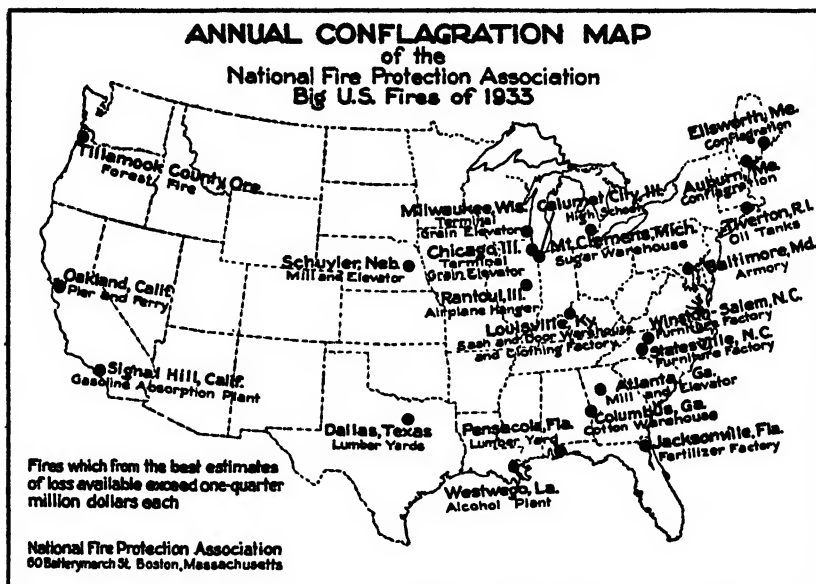

moratorium was to create skepticism as to the solvency of all financial institutions, insurance companies as well as banks, and made it temporarily impossible for the companies to pay losses. The decision to withhold payment of losses for 60 days discouraged incendiarism and made honest property owners unusually careful to avoid having fires.

Other factors in the lower loss for 1933 may be the better coördination of fire prevention activities, more favorable weather conditions, the upturn in business since March and the general drive against arson, resulting in a higher percentage of arson convictions. This drive came opportunely, at a time when the rising tide of incendiarism had reached the dwelling house, a classification normally least affected by arson. Just what per cent of the fire loss of the country is due to arson is a matter of conjecture, but the experience of the past year seems to substantiate the opinion that incendiarism, deliberate or unconscious, is responsible for a very substantial part of the total fire loss.

LARGE LOSS FIRES 1933. The National Fire Protection Association reports 22 fires involving an individual loss estimated at \$250,000 or more, just half the number reported for the previous year. Two conflagrations occurred in Maine communities in May. On May 7 a part of the business and residential sections of Ellsworth, Maine was destroyed. Most of the 127 buildings burned were of frame construction and 97 had wooden shingle roofs, the principal factor in the spread of the conflagration. The destruction of 250 buildings in Auburn, Maine, on May 15 was also due largely to wooden shingle roofs. The most serious forest fire of recent years occurred in Tillamook County, Oregon, from August 14 to 26 inclusive. Approximately 267,000 acres of forest area were burned over and it is estimated that ten billion feet of high grade virgin timber were destroyed. The direct property loss to the owners of the timber is estimated between \$10,000,000 and \$20,000,000 based on present discounted values. Indirect losses, including taxes, freight charges, and labor, which would have benefited had the timber been liquidated in a normal way during the next fifteen or twenty years, will amount to many times the direct fire loss.

The accompanying map shows the location of the large loss fires and the character of property involved. The chief factors responsible for the large loss in these 22 fires are shown by the following table. In most instances more than a single factor was involved.

	No. of fires
Inferior construction	14
Headway of fire when discovered	11
Ineffective fire fighting	8
Failure of private fire protection	8
Inefficient fire fighting (including bursting of hose)	3
Fire department delayed in getting to work ..	2
Unfavorable weather conditions	9
Highly combustible contents or excessive amounts of burnable materials	7
Lack of adequate public or private protection ..	5
Sprinkler equipment shut off	4
Inadequate water supplies	4
Point of origin difficult of access	3
Large quantities of flammable liquids	3
Delayed alarm	3
Explosions aided rapid spread of fire	2
Wooden shingle roofs	2
Delayed fire department response	2
Lack of exposure protection	1
Contents especially susceptible to water damage ..	1
Forest inaccessible and in tinder-like condition ..	1

PUBLIC AND PRIVATE FIRE PROTECTION. The general trend toward the reduction of fire department personnel and economy in equipment noted in 1932 continued in 1933, but did not go far enough to have any material effect on fire losses. There were few, if any, significant extensions of private fire protection during the year, but projects inaugurated for the relief of unemployment, financed by Federal funds, promise a valuable contribution toward fire safety. These include the protection of public buildings by automatic sprinklers, replacement of old public buildings by modern fire-resistive structures, the clearing of fire breaks and trails in forests, and other projects.

RURAL FIRES. The decrease in fire losses in urban areas during the past few years has not extended to farms and rural communities, where organized fire prevention and fire protection effort involves much greater difficulties. To meet this situation the National Fire Protection Association in 1933 organized a Volunteer Firemen's Section designed to disseminate fundamental fire prevention information through the medium of the ten thousand or more volunteer fire departments in the smaller communities in the United States, and to improve fire fighting technique. The response to this move has been enthusiastic.

MARINE FIRES. A series of fires at sea, culminating in the destruction of the French liner *Atlantique*, has stimulated the interest of ship owners and operators, naval architects and builders, and the marine underwriters, and has forced the realization that modern marine construction has lagged behind shore practice in respect to fire safety. Opinion on this subject was crystallized during 1933 with the preparation by the Marine Committee of the National Fire Protection Association of a standard for fire-resistive construction of vessels, and a subsequent project for expanding the Committee into a Marine Section of the N.F.P.A. as a general forum for the discussion of marine fire problems and a medium for putting into effect improved standards of marine fire safety.

FISK UNIVERSITY. A coeducational institution for colored people in Nashville, Tenn., founded in 1866. It consists of a liberal arts college, a music school, and a graduate department. The total enrollment of 350 for the autumn of 1933 included 144 men and 206 women. The faculty numbered 41, and there were 14 administrative officers and assistants. The productive endowment for 1932-1933 was \$1,510,000 and the total income was \$278,078.51. The library contained approximately 45,100 volumes. President, Thomas Elsa Jones, Ph.D.

FIVE-YEAR PLAN. See UNION OF SOVIET SOCIALIST REPUBLICS.

FLAX. The flaxseed production in 1933 of 13 countries reporting to the International Institute of Agriculture, estimated at 26,681,000 bushels, was 18.6 per cent below the yield of 32,780,000 bushels in 1932 and 34 per cent below the average annual yield for the five years 1927-1931. The crops of the leading producing countries not including the United States were reported as follows: India 16,120,000 bushels, Lithuania 829,000 bushels, and Canada 679,000 bushels. The Canadian crop was only 27.8 per cent of the preceding year's production and 18.8 per cent of the average annual yield for the five-year period mentioned. Argentina, the world's leading flaxseed producing country, reported a yield of 52,305,000 bushels for the crop year 1932-1933 of the southern hemisphere as compared with an annual average of 75,694,000 bushels for the five-year period reported. Preliminary estimates placed the yield of the 1933-1934 harvest season of 50,000,000 bushels. The Soviet Republics reported an average annual yield of 25,081,000 bushels for the four years 1927-1930 and an average annual acreage of 5,238,000 acres for the five years 1927-1931.

Preliminary estimates by the Department of Agriculture placed the flaxseed production of the United States in 1933 at 6,785,000 bushels, the smallest production since 1919 and as compared with 11,671,000 bushels in 1932 and 20,011,000 bushels, the average annual yield for the five years 1926-1930. The area devoted to the crop

in 1933 was 1,283,000 acres, or only 65 per cent of the area in 1932 and 43 per cent of the average annual acreage for the five-year period last mentioned. The 1933 average yield per acre, 5.3 bushels and one of the lowest on record, was the result largely of long continued drought in North Dakota, South Dakota, and Minnesota. Among the ten States reporting flaxseed production Minnesota ranked first with a yield of 4,365,000 bushels and North Dakota second with 1,677,000 bushels. These two States produced 89 per cent of the country's crop. Kansas ranking third produced 223,000 bushels and Iowa, fourth, 175,000 bushels.

During the fiscal year ended June 30, 1933 the United States exported 101,000 long tons of linseed oil cake, 7000 long tons of linseed oil cake meal, and 781,000 pounds of linseed oil, and imported 6,213,000 bushels of flaxseed, 36,000 pounds of linseed oil, and 20,071,000 pounds of linseed oil cake and oil cake meal.

The International Institute of Agriculture reported the total yield of flax fibre in 1933 in seven European countries and Egypt at 62 per cent above their production in 1932 but very much below the annual average for the five years 1927-1931. Lithuania, the leading country, reported a yield of 39,656,000 pounds and Latvia, ranking next, of 28,263,000 pounds. A yield of 1,212,546,000 pounds was recorded for the Soviet Republics in 1932 and an average annual production of 844,797,000 pounds for the five-year period. Experiments with fibre flax by the United States Department of Agriculture and the agricultural experiment stations indicated that a good quality of fibre can be produced in the United States.

FLEMISH AUTONOMY MOVEMENT. See BELGIUM.

FLETCHER, SIR WALTER MORLEY. A British physician, died in London, June 7, 1933. Born in Liverpool, July 21, 1873, he was educated at Trinity College, Cambridge, where from 1900 to 1914 he was senior tutor and lecturer in natural sciences. He served also as senior demonstrator in physiology at Cambridge University during 1903-05 and as proctor during 1904-05 and from 1899 to 1914 was president of the Cambridge University Pitt Club. In 1914 he was appointed secretary of the Medical Research Committee and at the time of his death was serving as secretary of its successor, the Medical Research Council, recognized in almost every branch of medicine as the leading organization of its kind in the world. Sir Walter personally sponsored its study of vitamins and of viruses and advocated the new use of insulin to diminish the risk of shock after a surgical operation. During 1928-29 he was chairman of the Committee on the Organization of Medical Research under the government of India. He was also a member of the Army Pathology and Air Force Medical Advisory Committees, the Pensions Ministry Disability Committee, and the Health Advisory Committee.

From 1919 to 1922 Sir Walter served as a member of the Royal Commission on Oxford and Cambridge Universities and in 1915 was Croonian lecturer for the Royal Society, of which he was a Fellow. He was also a Fellow of the Royal College of Physicians and of Trinity College, Cambridge. In 1918 he was created a Knight Commander of the Order of the British Empire and in 1929 a Companion of the Bath. His papers appeared in the *Journal of Physiology* and other scientific periodicals.

FLOOD CONTROL. MISSISSIPPI RIVER. Before noting the present status of Mississippi Flood Control work it might be well to recall just what the 1928 flood-control project, drawn up after the record breaking flood of 1927, contemplated. The main points of this plan are:

1. The raising of the levees line about 3 feet above the previously adopted or 1914 grade line, along the whole length of about 1000 miles of river from Cairo to New Orleans.
2. The construction of an emergency spillway at Bonnet Carre, just above New Orleans, to discharge flood-flow into the upper arm of Lake Pontchartrain (an arm of the Gulf of Mexico).
3. The construction of three wide floodways outside the normal leveed width of the river's high water channel, one just below Cairo to lower the flood crests at Cairo, a second from the mouth of the Arkansas southerly through the western half of the Tensas Basin (Bouef Floodway) to carry the excess floodflow which the leveed river could not accommodate, and a third along the course of the Atchafalaya River to carry water from the Red River and from the Bouef Floodway directly to the Gulf, leaving only part of the total discharge to go past Baton Rouge and New Orleans.
4. Stabilization of the river channel was to be carried out.

The critical levee work on the main river is nearly completed. About 385 miles of levee remain to be raised, and of this 148 miles is opposite back-water areas. More than half of the remainder is north of Helena (in the Memphis district). These latter levees were to have been completed in 1933 if the funds could be obtained. The Missouri and Bonnet Carre floodways are completed. The Atchafalaya guide levees have been started. Work has been started in the Tensas Basin. River stabilization is still an important problem.

A significant happening of the year was the artificial cutoff in one of the Greenville Bends. These four loops had previously been maintained for 50 years by revetment work and dike construction. The advisability of this cutoff had previously been established in Vicksburg tests.

RIO GRANDE. A positive step in solving the difficult problem of flood control in the stretch of the Rio Grande extending from El Paso, Tex., 155 miles to Box Canyon below Fort Quitman, Tex., was taken by the signing on February 1 by representatives of Mexico and the United States of a convention based on a report of the International Boundary Commission created by the two nations.

The situation called for international action. The Rio Grande, rising in Colorado, flows almost directly south through New Mexico to El Paso, Tex., with Juarez, Mexico, across the river. At El Paso the river swings eastward and thence marks the boundary between Mexico and the United States.

Above El Paso the river valley lands are developed for irrigation, water being taken by means of diversion dams at several points along the river. In 1916 the Elephant Butte Dam was built about 150 miles above El Paso to store floodwaters for regulating the dry weather flow for irrigation. Below El Paso the river valley, which is wider than it is above El Paso, is developed for irrigation on both the Mexican and the American sides. It is in this section that the great problem of flood control and land drainage has arisen.

Through the El Paso-Juarez Valley the river has a serpentine course. Floods from the runoff area lying between Elephant Butte and El Paso-Juarez are of annual occurrence. The Mexican Department of Communications and Public Works and the City and County of El Paso have expended in the last few years more than \$750,000 to pro-

tect the city of El Paso-Juarez and the valley lands from floods. These works consist largely of levees built along the banks of the meandering channel, and they require constant strengthening and repair on account of the raising of the riverbed. A more substantial and effective plan must be adopted to secure permanent and efficient protection.

The plan of Rio Grande flood control proposed by the International Boundary Commission consists of a detention dam at Caballo on the upper river above El Paso-Juarez and a rectified channel for 155 miles of the river below those cities. Briefly, the engineering features involve: (1) the reduction of river length in the El Paso-Juarez Valley from 155 miles to 88 miles; (2) the provision between levees along this 88 miles of a floodway 590 ft. wide having a capacity of 11,000 sec.-ft.; and (3) increasing the slope from 1.82 ft. per mile to 3.28 ft. per mile. The total cost of the work will be about \$7,365,500.

MODEL STUDY. Observation on natural rivers has proved a slow and almost hopeless road for one who desires to discover the laws through which rivers may be regulated. Hydraulic laboratories to study such problems have been developed in Germany especially, but also in France, Italy, Great Britain, and the United States. They have proved that a well equipped laboratory can solve many problems and yield profits many times over the investment.

In 1929, for instance, the Mississippi River Commission decided to apply laboratory experimentation to its river problems. It built the Waterways Experiment Station at Vicksburg and began intensive river model experiments in 1930. Scientific methods were applied to river problems such as cutoffs, transportation of sediment, in suspension and along the bottom, and protection of railway embankments with results of much practical worth.

The process of developing model similitude is of some intricacy. The essential problems of model design are: (1) selection of type, (2) selection of model limits, and (3) selection of model scale values. Models may be reduced or full scale, distorted or undistorted scale, and fixed bed or movable bed. Definition is obvious except perhaps of distorted and undistorted models. Physically, the distinction is simple. An undistorted model is one in which all linear dimensions are on the same reduced scale; the model has exact geometrical similarity to the object in nature (river channel or harbor) that is being modeled for the test. In a distorted model the geometrical similarity is abandoned by making the vertical and the horizontal scales different. The purpose of this distortion is to get similarity of performance between model and prototype.

It is impossible in a small model of a river or a harbor to simulate in model scale all the natural conditions. Certain forces acting and properties of materials acted upon cannot be reduced to model scale. These properties include density and viscosity of the liquid and the size, shape, cohesion, and density of the bed and bank materials. The external forces include gravity, friction, and surface tension. It is obviously impossible to decrease or modify these forces and properties to model scale ratios. In order that they may not become disproportionate, they are kept in harmonious relationship by geometrically distorting the model by increasing the vertical scale, i.e. geometrical similitude sacrificed to secure simi-

tude of effect. Vertical distortions of 8 and 10 to 1 have been found most convenient.

BIBLIOGRAPHY. The monumental volume, *Hydraulic Laboratory Practice* published in 1929, contains many examples of the river and harbor studies now undertaken by means of models.

FLOODS. Heavy rains in December, 1932 and January, 1933 caused many rivers in the South Atlantic, Gulf, and the Ohio Valley States to pass the flood stage. Some streams, notably the Tallahatchie and Yazoo Rivers in Mississippi, remained in flood for long periods. In general the floods during January and February were not important but the floods in the Alabama, Wabash, White, St. Francis, and Ouachita rivers at this time were severe.

In the four months of March to June, inclusive, floods were unusually numerous and severe in the Mississippi and Columbia river systems, but in other parts of the United States no important floods occurred. Also no significant flood occurred in the Missouri basin during this time, and the absence of high water in the Missouri materially lessened the severity of the floods in the lower Mississippi.

Heavy rains in the upper Mississippi basin, beginning in late March, caused three floods, each of short duration, in the upper Mississippi River and two prolonged floods in the Illinois, as well as floods in the smaller streams. In southern Wisconsin and Northern Iowa rapidly melting snow at the beginning of these rains caused some unusually rapid rises in the streams there.

The first flood in the Illinois River was the highest since the great 1927 flood in the upper reaches but was not so severe in the lower reaches of the river. The second flood was even more severe than the first.

Important floods occurred in all of the northern tributaries of the Ohio, but only minor floods occurred in the southern tributaries. Among the northern tributaries of the Ohio the Wabash had the most severe floods. During the three months of March, April, and May five flood crests passed down the Wabash. One of these five crests, that of May, was the most destructive flood in this river since January, 1930.

In the Ohio River three flood crests took place. The first extended from Pittsburgh, Pa., to Cairo, Ill., from March 15 to April 4. The second from Dam No. 47 (near Newburgh, Ind.) to Cairo, from April 22 to April 24. The third from Portsmouth, Ohio, to Cairo, Ill., from May 14 to May 24. The second of these crests was the least important.

The flood of March was more destructive than any since the very disastrous flood of 1913. However points on the Ohio River above Parkersburg, W. Va., have had higher stages than the March, 1933 crests since 1913 as also has Paducah, Ky. For the reach from Parkersburg to Paducah the March, 1933 flood was the highest for 20 years.

This March flood occurred very suddenly. On the morning of March 12 fair weather prevailed over the Ohio Valley and the weather map of that day did not indicate any especially heavy rains for the Ohio Valley. The river was at or below the average stage for this time of the year. Moreover the precipitation for the past three months had not been heavy and the ground was not overly moist for this season. In less than 24 hours rains set in which lasted for nearly three days. The rains were heaviest around Pittsburgh and on March 18 it appeared that the

flood stage would not be reached below Huntington, W. Va. However a second and more severe storm with heaviest rains around Cincinnati caused the river to rise very rapidly to the highest stages of the season.

Although the March, 1933 flood was the most destructive flood since 1913 and in spite of the fact that it came on with great suddenness the total damage was not excessive. The total damage for the March, 1933 flood was about \$2,000,000 as compared with about \$154,000,000 for the 1913 flood. The small damage of the March, 1933 flood was mainly because the 1933 flood did not attain the height which the 1913 flood did, but was also partly the result of flood protection works and increased efficiency of flood warnings.

Very heavy rains fell over southern Ohio and northern Kentucky on May 13 and 14. This narrow strip of heavy rainfall caused the Ohio to reach flood stage immediately thereafter although several of the tributaries did not reach flood stage. While this flood was much lower than the March flood it is noteworthy because the crest stage at Cincinnati was the highest during the summer half of the year (May 1 to November 30) since the August, 1875 flood.

In the lower Mississippi basin severe floods occurred in the Black and St. Francis rivers both in April and May. The St. Francis flood of April caused four breaks in the levees, while that of May caused 19 breaks. The crest stage of the May flood was the highest of record in the upper reach of the St. Francis River. Considerably higher water would have occurred in the lower reach of this river had there been no breaks in the levees.

The flood in the Tallahatchie-Yazoo rivers lasted for six months and reached high stages. The crest at Swan Lake, Miss., was exceeded only by the 1932 flood crest while the crest at Greenwood, Miss., was exceeded by the floods of 1882, 1927, and 1932.

There were two rises in the lower Mississippi River. The first lasted from March 26 to about the middle of May, and was principally the result of the first rise in the Ohio River. The second lasted from the middle of May to June 19 and was principally the result of the third rise in the Ohio River and the nearly simultaneous overflows in the upper Mississippi and Illinois Rivers. The lower Mississippi River did not pass below the flood stage at all points between these rises. No crevasse occurred in the levees of the lower Mississippi River.

A prolonged flood occurred in the Atchafalaya River in Louisiana. The chief interest of floods here is the changes which they cause in the river channel. During the last 50 years the channel capacity has steadily increased except that there was a moderate decrease in channel capacity in the upper reach following the 1927 flood. The behavior of the 1933 flood would indicate that the lower reach is still increasing its channel capacity.

The Columbia River reached its highest stage since 1894 during a long flood which ended late in July. This flood was the result of melting snow. The winter of 1932-33 was unusually cold over the Columbia basin, and while the precipitation was not much above the normal, practically all of it was in the form of snow and very little of the snow melted until the coming of spring. Temperatures remained below normal until the middle of May when an unusually warm spell of weather set in. Following this warm weather

record breaking rains fell in the Willamette Valley, causing higher stages in the Willamette and its tributaries than had ever been recorded in June. Then heavy rains fell in northern Idaho, causing a rapid rise in the Clearwater. Then a second spell of warm weather set in bringing temperatures above 100°. The Columbia river reached its crest late in June.

The damage at Portland, Ore., was not very great because of the protection afforded by the harbor wall and pumping system. Basements in the principal west-side business district, which heretofore had been generally flooded in high-water periods, were kept dry in this flood.

Unusually heavy rains in Oregon and Washington during December caused severe floods in the streams there. Over most of these States the month was the wettest December on record. While the Columbia did not reach nearly so high a stage as during the previous June, in general the small streams reached considerably higher stages and the total damage caused by the December floods was about six times as great as the total damage caused by the June floods. The reason of this disparity was that the June floods occurred only in the Columbia River, which has extensive flood protection works, while in December floods occurred in the minor streams as well and these do not have any extensive flood protection works.

UNITED STATES FLOOD LOSSES IN 1933

Drainage ^a	Reported losses ^b	Lives
Great Lakes	\$ 74,250	0
Atlantic Slope	5,585,923	2
Gulf (except Mississippi) ..	1,500,061	0
Mississippi (except Ohio) ..	10,257,003	6
Ohio	6,174,178	1
Pacific Slope	11,730,995	14
Total	\$35,322,410	23

^a There were no losses reported in other Drainage Areas.

^b Probably about 75 per cent of actual.

Floods naturally fall into two classes. One type is the local flood which is caused by very heavy rains over a small locality. If the locality is not densely populated little damage is done but if thickly settled great damage is sometimes caused by a local flood. The other type is the flood in a large stream caused by heavy rains over very extensive areas. Among local floods in 1933 may be mentioned one in Bear Creek Valley on July 7 and one in Cherry Creek Valley on August 3, both near Denver, Colo. The latter flood caused Castlewood Dam, 32 miles above Denver, to break. In this flood two persons were drowned, hundreds of acres of fertile farm lands were ruined. Many head of livestock were lost and many bridges, six within the city limits of Denver, were destroyed. Basements of hundreds of houses in the lower portion were flooded, and water completely filled the subway of the Union Station and reached a depth of one and a half feet in the main waiting room. The total damage approximated \$1,000,000.

Heavy rains in southern Mississippi, Louisiana, and eastern Texas occurred on July 15-16 and still heavier rains on July 23-26. These rains caused very high stages in the Sabine River (the highest of record in the upper part) as well as much flooding in the creeks and small streams. The damage was greatest in and around Shreveport, La. These heavy rains flowed off very slowly because the levees are built to keep water from flowing from the river to the adjacent land. In

this case the Red River was low but the flood water on the surrounding land could not readily reach the river because of the levees.

Local floods occurred in Wichita and Scott Counties of Kansas on August 4-5.

A tropical hurricane passed over the Middle Atlantic States on August 23-24 and the resulting rains caused rises in all the rivers of these States, the Delaware, Schuylkill and Susquehanna passing the flood stage. The Delaware and Schuylkill rivers reached very high stages and caused much damage. Much flooding occurred in the creeks of the Middle Atlantic States during these rains.

Unusually heavy rains over the Big Sioux River Valley in Iowa and South Dakota on September 1 caused a flood.

The Rio Grande River was above flood stage during the greater part of September but very little damage resulted. See FLOOD PROTECTION.

FLORIDA. POPULATION. The population of the State on Apr. 1, 1930, according to the Fifteenth census, was 1,468,211; in 1920, it was 968,470; in 1933 (Federal estimate), 1,554,000. Jacksonville had (1930) 129,549 inhabitants; Miami, 110,637; Tampa, 101,161; Tallahassee, the capital, 10,700.

AGRICULTURE. The following table shows the acreage, production, and value of the principal crops for 1933 and 1932:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges	1933	15,100,000 *	\$18,875,000	
	1932	16,200,000 *	20,736,000	
Grapefruit ..	1933	9,800,000 *	8,702,000	
	1932	11,800,000 *	8,558,000	
Corn	1933 673,000	5,384,000	3,392,000	
	1932 687,000	5,840,000	2,219,000	
Potatoes	1933 18,000	2,232,000	1,897,000	
	1932 23,000	1,541,000	1,842,000	
Peanuts	1933 252,000	131,040,000 *	2,883,000	
	1932 273,000	113,295,000 *	1,360,000	
Sweet potatoes	1933 21,000	1,470,000	882,000	
	1932 25,000	1,500,000	660,000	
Cotton	1933 96,000	27,000 *	1,215,000	
	1932 102,000	17,000 *	484,000	

* Boxes. ♢ Pounds. ° Bales.

MINERAL PRODUCTION. Further severe curtailment occurred in the production of phosphate rock, the State's main mineral industry. The shipments fell to 1,486,573 long tons (1932), from 2,061,466 (1931); their value, to \$4,652,275, from \$7,202,086.

FINANCE. State expenditures in the year ended June 30, 1932, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments \$19,391,079 (of which \$6,339,554 was for local education); for interest on debt, \$4072; for permanent improvements, \$6,365,048; total, \$25,760,199 (of which \$9,048,751 was for highways, \$3,048,760 being for maintenance and \$5,999,991 for construction). Revenues were \$25,904,554. Of these, property and special taxes furnished 15.8 per cent; departmental earnings and compensation to the State for officers' services, 8.9; sale of licenses, 63.4 (in which was included a gasoline sale tax that produced \$8,875,022). Funded debt outstanding on June 30, 1932, totaled \$500,000, which did not include a contingent debt of \$11,692,686, the immediate liability of the Everglades drainage district. On an assessed valuation of \$520,453,958 the State levied in the year ad-valorem taxes of \$2,681,357.

EDUCATION. There were enrolled in the public schools of the State, in the academic year 1932-

33, 374,915 pupils. Of these, 324,013 were in common schools or elementary grades, and 50,092 were in high schools. The reported enrollment in the high schools was considerably less than that for the year before, but that for the common schools and elementary grades increased by a somewhat greater total, and the total enrollment was consequently slightly higher. The expenditures of the year for public-school education (current only) totaled \$10,649,499, which was nearly \$3,000,000 less than the total reported for the year previous. The salaries of teachers, by the year, averaged \$676.78. The averages for white and those for colored teachers differed, that for whites being \$812.40 and that for the colored, \$352.01.

CHARITIES AND CORRECTIONS. Central authority over the State's institutions of care and custody, under the system in force in 1933, was exercised by a Board of Commissioners of State Institutions. This body was composed of seven *ex-officio* members: the Governor, as chairman, and the Attorney-General, Secretary of State, Comptroller, Treasurer, Superintendent of Public Instruction, and Commissioner of Agriculture. It had an executive secretary (J. P. Newell). The five institutions under the supervision of the board were: Florida State Hospital for the Insane, at Chattahoochee (population at the end of 1933, about 3750); Florida Industrial School for Boys, Marianna (about 400); Florida Industrial School for Girls, Ocala (about 91); Florida State Penitentiary, Raiford (about 1622, exclusive of some 1365 convicts in road camps); Florida Farm Colony for the Feeble-Minded and Epileptics, Gainesville (about 492).

LEGISLATION. A regular 60-day session of the Legislature opened on April 4. Provision was made for the popular election of 67 delegates to a State convention which was to act for the State with regard to the proposed repeal of the Federal Eighteenth Amendment. The sale of 3.2 per cent beer was legalized, and a system of local option as to the control of liquor was enacted, subject to popular approval by vote, to replace the existing State prohibition law. Taxpayers of certain localities were allowed to present bonds of the respective localities in discharge of delinquent taxes. A decrease of about \$2,000,000 a year was effected in State appropriations. The 7-cent tax on gasoline was continued for two years. Death was made the penalty for kidnapping except when the jury finding guilty should recommend mercy, in which case life imprisonment was prescribed. The practice of nepotism in appointments to public office was prohibited; residence of two years within the State was made a necessary qualification for public employment, that of teachers in the public schools included. A strict system for the certification of eggs, in labels and advertising, and for their inspection by the commissioner of agriculture, was provided.

POLITICAL AND OTHER EVENTS. Miami was the scene on February 15 of an attempt to assassinate President Roosevelt. While in an automobile passing through a crowd on his return from a fishing trip, he narrowly escaped being hit by several shots fired from a pistol by a crank of radical ideas named Zingara. Mayor Anton Cermak (q.v.) of Chicago, who was close to Mr. Roosevelt, was mortally wounded. Zingara was seized, prosecuted for murder by the State, convicted, and executed.

At the height of the banking panic the banks of the State were closed on March 4 by the Governor's proclamation of a legal holiday. On October 10 there were elected by a light popular vote, in the approximate proportion of 4 to 1, delegates favorable to repeal, who met in State convention on November 27 and voted the State's adoption of the superseding amendment proposed by Congress for the repeal of the Eighteenth Amendment. A Federal three-judge court, in a case relating to payments in St. Lucie County, ruled that the State statute known as the Futch law, permitting taxpayers to present the depreciated bonds of their respective communities at par in payment of taxes was unconstitutional. The Federal Supreme Court in a decision of March 13 invalidated as unconstitutional a State law taxing chain stores that increased the rate of the tax in proportion to the number of counties in which a chain of stores operated.

OFFICERS. The chief officers of the State, serving in 1933, were: Governor, David Sholtz; Secretary of State, R. A. Gray; Attorney General, Cary D. Landis; Comptroller, J. M. Lee; State Treasurer, W. V. Knott; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

Judiciary. Supreme Court: Chief Justice, Fred H. Davis; Associate Justices, Rivers Buford, W. H. Ellis, James B. Whitfield, Armstead Brown, Glenn Terrell.

FLORIDA, UNIVERSITY OF. A State institution of higher education for men in Gainesville, Fla., founded in 1905. In the autumn of 1933 the registration totaled 2242; distributed as follows: Arts and Sciences, 618; Business Administration, 500; Engineering, 346; Education, 212; Agriculture, 167; Law, 224; Graduate, 123; Architecture and Allied Arts, 60. The registration for the summer session of 1933 was 498 men and 588 women. The general faculty numbered 158. The cost of operating and maintenance was \$2,134,944; the annual endowment was \$315,488. The library contained 90,000 volumes. A new \$350,000 laboratory-demonstration school building to be used in connection with the College of Education will be completed early in 1934. It will house a school of twelve grades and a nursery and kindergarten—about five hundred pupils in all. President, John James Tigert, LL.D.

FLORIDA STATE COLLEGE FOR WOMEN. An institution founded in 1905 at Tallahassee, Fla., for the higher education of women. For the year 1933-34 the faculty numbered 139 members. The enrollment for the autumn of 1933 was 1504, distributed as follows: Graduate School, 7; College of Arts and Sciences, 616; School of Education, 629; School of Home Economics, 176; School of Music, 46; Special Students, 30. The enrollment for the summer session was 572. There were 53,500 volumes in the Library. Income: State appropriations, \$480,065; all other sources, \$86,454. President, Edward Conradi, Ph.D.

FOOTBALL. Princeton University's football team, taught by Herbert Orrin (Fritz) Crisler, dominated the collegiate game in 1933. The Tigers possessed the lone eleven of major magnitude to go through the season undefeated and untied, and accomplished the feat with such impressive dispatch that other claims of greatness bowed to Princeton's. Up to the final Saturday of the season, Army and Duke stood on the same plane with Princeton, but a Notre Dame team, beaten five

times, scored thirteen points in the last ten minutes to down Army, and an ill-considered Georgia Tech eleven turned on Duke. Michigan's team went through undefeated but was held to a scoreless tie by Minnesota.

In a season that showed such amazing evenness among the more important teams, attendance boomed. A check-up after the season showed a 13 per cent increase in attendance figures over 1932, besides a greatly decreased mortality list and a marked subsiding of the critical outbursts against the evils of commercialization. Ticket prices were lower, more in accord with the pocket-books of the spectators, and the year furnished the greatest crowd in Western Conference history when 93,000 saw Michigan subdue Ohio State. Southern California played to more than 600,000 persons in the season and new attendance records were set in the Big Ten, Big Six, and Rocky Mountain areas. No fewer than thirty-five of forty-six major colleges reporting their figures, showed an increase.

The 1933 season was one in which past reputations meant little. After winning twenty-eight consecutive games, Southern California bowed to Stanford and was held to a tie by Oregon State. Notre Dame, held to a tie by Kansas in the first game of the season, lost to Carnegie Tech, Pittsburgh, Navy, Purdue, and Southern California, Purdue, Tennessee, Alabama, Tulane, Colgate, and Utah, all powers of 1932, met with setbacks in 1933.

Notre Dame's campaign, capped by the victory over Army, was the most disastrous in its history, and at the end, Hearly Anderson, coach, was succeeded by Elmer Layden, former member of Knute Rockne's famous Four Horsemen backfield. Princeton's eleven, the only major one in the country to do all that was asked of it, downed in succession Amherst, Williams, Columbia, Washington and Lee, Brown, Dartmouth, Navy, Rutgers, and Yale, and allowed the opposition a total of only eight points in the process. Columbia rallied after the crushing defeat by Princeton and swept through all other opponents to be chosen as Eastern representative in the Rose Bowl game at Pasadena, Calif. New Year's Day, to face Stanford, conqueror of Southern California. Columbia was the first New York City team ever chosen for the Rose Bowl, and was invited when Princeton and Michigan turned down the offer.

Fordham, coached by Jim Crowley, showed a 100 per cent attendance increase and lost only two games—to St. Mary's and Oregon State. It was one of the most powerful teams in the country as well as in the east. Among the other eastern titans were Pittsburgh, Boston College, Duquesne, Colgate, Villanova, and Bucknell. Michigan was supreme in the Big Ten, winning the conference title for the fourth straight year. Nebraska again took the Big Six crown. The Conference title on the Pacific Coast was shared by Stanford, Oregon, and Southern California. Alabama carried off the honors in the newly formed Southeast Conference, and Duke won in the Southern Conference. Arkansas, closely followed by Baylor and Texas Christian, had the best record in the Southwest Conference.

Professional football, operating under the regular intercollegiate rules with two important exceptions, was more popular than ever and furnished some exciting competition. The two rules exceptions used in the professional ranks were the moving of the goal posts to the goal line and

thus increasing the possibility of field goals, and the privilege of forward passing from any point behind the line of scrimmage. These changes opened up the game considerably and afforded more scoring chances. In the National League the Chicago Bears won the Western division title and downed the New York Giants, Eastern winners, in the final at Chicago, 23-21, before a crowd of 30,000.

The year was marked by the death of two famous coaches, Bill Roper, formerly of Princeton, and Major Frank Cavanaugh, formerly tutor at Fordham, Boston College, Holy Cross, and Dartmouth.

The scores of some important games follow:

Michigan, 40—Cornell, 0; Fordham, 2—Alabama, 0; Army, 21—Yale, 0; Stanford, 7—California, 3; Harvard, 19—Yale, 6; Southern California, 26—Oregon, 0; Princeton, 27—Yale, 2; St. Mary's, 13—Fordham, 6; Princeton, 20—Columbia, 0; Army, 12—Navy, 7; Georgia Tech, 6—Duke, 0; Michigan, 7—Illinois, 6; Notre Dame, 13—Army, 12; Tulane, 7—Louisiana State, 7; Chicago, 39—Dartmouth, 0.

FORDHAM UNIVERSITY. A Roman Catholic institution for higher education, under the Society of Jesus at Fordham, New York City, founded as St. John's College in 1841. It is the largest Roman Catholic educational institution in the United States. The enrollment for 1933-34 totaled 7274 students, including 1203 in the teachers' college and 636 in the graduate school, and a distribution among the other colleges as follows: Law, 1088; Fordham College, 1549; Fordham College (Manhattan Division), 574; School of Business, 206; Pharmacy, 177; Social Service, 331; preparatory school, 469. The registration for the summer session of 1933 was 1041. There were 375 faculty members. The endowment fund amounted to \$4,454,000. There were 115,000 volumes in the library. President, the Rev. Aloysius J. Hogan, S.J., Ph.D.

FOREIGN ARCHITECTURE. See ARCHITECTURE.

FORESTRY. Astounding developments in the field of public forestry marked the year 1933. The organization of the Civilian Conservation Corps under authorization of the Unemployment Relief Act passed by Congress on March 31 made possible the greatest advance in constructive forestry that the nation has ever witnessed. As a result of this action an army of 300,000 young active workers directed by skilled foresters were employed in planting cutover lands, in thinning overcrowded forests, in constructing fire lanes and roadways, preventing erosion by building dams and setting out soil retaining plants and in various other useful operations. At one stroke of the pen there was removed from the ranks of idleness thousands of the nation's young men and great forward strides were made possible in protecting and developing the forests, one of the nation's primary assets. Although it is not expected that a large number of the temporary forest workers will pursue forestry as a life vocation, it is certain that they will take back to their homes a more intelligent conception of the important rôle that forests play in the welfare of these United States. Additional stimulus to constructive forestry resulted from an allotment of nearly \$16,000,000 by the Public Works Administration for improvement and protection work on the National Forests and for the support of existing research activities. A grant of \$50,000,000 from the Industrial Recovery Act for building roads and trails in the National Forests, Na-

tional Parks and other public domains made possible much needed improvements.

LUMBER TRADE AND PRODUCTION. There was a surprising similarity in the values of the export and import trade in lumber products for the years 1932 and 1933 as revealed by figures released in the October Monthly Summary of the United States Department of Commerce. The total value of exports, including unmanufactured wood, sawmill products, wood manufactures, paper base stocks and paper, and manufactures, was \$50,529,310 in 1933 and \$51,406,648 in 1932. The total value of the imports of the same items was \$134,635,583 in 1933 as compared with \$139,581,675 in 1932. In view of the sharp decline from 1931 to 1932, the slight changes of the present year may well be considered indicative of improved business conditions in the lumber world.

Lumber production within the United States continued at low ebb but with some increase in late autumn as a result of purchases for the construction of winter camps for the Civilian Conservation Corps and for new construction authorized by the Public Works and Civil Works Administrations. An item in a late December issue of the *Washington Star* states that the lowest point in lumber production since 1869 was reached in March, 1933, with an upward movement since that time. Production in 1932 was 10,000,000,000 feet as compared with 37,000,000,000 feet in 1929.

The formulation of the Lumber Code under authority of the National Recovery Act was expected to aid in bringing about a better situation in 1934 due to stabilization of prices and to restrictions in logging operations where overproduction now exists. A meeting of government officials and representatives of the lumber, pulp, paper, and naval stores industries was held at Washington, D. C. in late October to discuss those phases of the code dealing with conservation of national resources.

RESEARCH ACTIVITIES. Never before in the history of the United States was the need and value of research in forestry more keenly realized than in the past year. Provided suddenly with a veritable army of workers in the Civilian Conservation Corps, the burden of developing a constructive programme of operations became the overnight problem of the scientific foresters called into service with the corps. Fortunately the work of the United States Forest Service, of the forest schools, and certain other public and private agencies supplied a foundation of knowledge. For example, the discovery that currants and gooseberries are obligatory alternate hosts of the blister rust disease of five needled pines led to a constructive and ultimately highly profitable eradication programme.

Despite reduced funds for regular research work and loss of workers' time spent in assisting the Conservation Corps, much worthwhile progress was made by scientific foresters during the year. Naturally economic problems received considerable attention. Tax delinquency followed by reversion of the land to the States, an important problem in the Lake States, South and Pacific Northwest, was carefully studied in the hope of arriving at some satisfactory solution. Further work was done on the value of variations in water content of duff and dry wood as indication of fire hazards in the forest.

Studies by the United States Forest Service in the southern States showed that the planting of black locust, creeping plants, and grasses would

materially aid in preventing and checking erosion. The Forest Products laboratory at Madison carried forward its important work. Among its valuable findings were that Florida sand pine and Monterey pine may be successfully utilized in the manufacture of paper.

THE NATIONAL FORESTS. As set forth in the Report of the United States Forester for 1933, the addition of 648,454 acres during the fiscal year ended June 30, 1933 brought the total net area of the National Forests up to a total of 162,009,145 acres. The largest single acquisition, 466,254 acres, was made possible by the Presidential proclamation which created the Nicolet National Forest in Wisconsin. Perhaps never before was the potentially stabilizing value of the National Forests on employment so fully appreciated as when they afforded useful occupational fields for over 300,000 workers of the Civilian Conservation Corps.

Marked stimulus to the enlargement of national forests resulted from the publication of the so-called Copeland report, entitled *A National Plan for American Forestry* and prepared by the United States Forest Service under orders of the United States Senate. The report showed that less than 4 per cent of the nearly 9,900,000 acres of private land logged annually is cut with regard to the future growth. In addition to recommending better handling of privately owned forests lands, the report urged more rapid enlargement of the National Forests, particularly with reference to large areas of cut over non-productive land which will require actual planting. As presently constituted, these lands are national liabilities rather than assets.

FOREST FIRES. Although the aggregate losses from forest fires were unusually small in 1933, there were some exceptionally costly disasters. According to data presented in the September number of *The Timberman* over 10,000,000,000 board feet of prime timber were killed by a devastating conflagration known as the Tillamook fire, which swept over a large area in western Oregon in August. The burned area included more timber than is normally cut in Oregon in five years. The possibility of salvaging the best of the killed timber, approximately 80 per cent of which was Douglas fir, was considered by the national conference on forest practice and timber conservation held at Washington, D. C., October 25-27.

The total number of fires in 1933 was not greatly below 1932 but their average extent and cost of suppression was markedly less. See *Civilian Conservation Corps* below.

CIVILIAN CONSERVATION CORPS. Hailed before election as a friend of forestry, President Roosevelt justified the faith of Americans who recognize the importance of the forests in the national welfare by organizing promptly the Civilian Conservation Corps under the authority of the Unemployment Relief Act. More than 300,000 young men were taken from the ranks of the unemployed and brought together in 1466 forest camps scattered over the nation. Here, after preliminary conditioning, they were put to work on various planting, thinning, and fire prevention projects. Most of the conservation work camps were established too late in the spring for effective planting but about 4500 acres were planted in Pennsylvania, Wisconsin, and Minnesota during late May and early June. Adding about 39,000 acres, mostly in the Lake States region, in autumn plantings, the total acreage reforested was more than 43,500,

constituting a splendid beginning in the restoration of cut over lands to a profitable condition. In addition, the Conservation army prepared many thousands of acres for spring planting in 1934. According to information published in the *Washington Post* on December 1, the Conservation Corps played a most important part in the prevention and suppression of fires in the National Forests. Official estimates for the first 10 months of 1933 showed that burned areas were 60 per cent less than in the corresponding period of 1932.

Obviously much of this favorable showing was due to the presence of this considerable army of student foresters, ever ready to attack fires before they attained large proportions. Up to August 1, the Conservation Corps and 12,000 members of Indian camps had built 3944 miles of fire prevention trails, 1674 miles of telephone lines, 1020 miles of fire breaks, cleared 2279 miles of roadsides and removed fire hazards, such as unburned snags, from over 45,000 acres. When, in addition, the work in suppression of insects and diseases and in prevention of soil erosion is considered, even the severest critic must concede the venture well worthwhile.

NECROLOGY. Several well known foresters passed from the active field during the year.

Lord Lovat, founder of the Imperial Forestry Institute at Oxford, England, and Director of Forestry for the Allied Armies in France during the final period of the World War, died on Feb. 18, 1933.

T. S. Woolsey, Jr., author of several forestry books, including *American Forest Regulation*, *Studies in French Forestry* and *Riding the Chuck Line*, died July 10, 1933, at the age of 54 years.

John Bentley, Jr., Professor of Forest Engineering at Cornell University, died July 26, 1933. With A. B. Recknagel he was co-author of *Forest Management* and contributed many bulletins and scientific articles on forest subjects.

John M. Briscoe, Head of Forestry at the University of Maine, died Aug. 3, 1933, at Orono, Maine.

The most tragic loss of the year was the accidental death of Maj. Robert Y. Stuart, Chief of the United States Forest Service, on Oct. 23, 1933. In addition to carrying his own responsible duties, Major Stuart had during the year rendered material assistance to the Civilian Conservation Corps. He was succeeded by Ferdinand A. Silcox, a graduate of the Yale School of Forestry, former Forest Service employee, and, at the time of his appointment, Director of Industrial Relations of the New York Employing Printers Association.

BIBLIOGRAPHY. Under the stress of the depression, publications were relatively few during the year. Among the most noteworthy were: *Trees of North America* (exclusive of Mexico) vol. i.—*The Conifers*. G. R. Green. Ann Arbor, Mich., 1933; *Forestry Bankruptcy in America*. G. P. Ahern. Washington, D. C., 1933; *Forestry, An Economic Challenge*. A. N. Pack. New York, 1933; *Enquête Internationale sur les Incendies de Forêts*. Rome, 1933.

FORMOSA or TAIWAN. An island belonging to Japan, about 75 miles from the southeast coast of China and opposite the province of Fukien. Total area, 13,890 square miles including the adjacent Pescadores Islands (49 square miles) and other small islands. The total estimated population in 1932 was 4,932,433. In 1929 there were 220,730 Japanese, and 43,118

foreigners. The chief cities are Taihoku, the capital (229,005 inhabitants in 1930); Tainan (95,013); Keelung (74,541); and Kagi (55,405). Chinese is the language most used but Japanese is used officially. In 1930-31 there were 134 primary schools for the education of the Japanese, with 34,163 students; for educating the natives there were 757 schools, with 248,478 pupils. The University of Formosa was opened in 1928.

Rice, tea, sugar, and various fruits, are the chief agricultural products. The island supplies all the world's Oolong tea and nearly all the natural camphor. Indigo, hemp, sweet potatoes, cereals, and peanuts are other crops. Agricultural production: rice (1932-33 estimate), 1,631,100 metric tons; cane sugar (1932-33 estimate), 700,900 metric tons; tea (1931), 9600 metric tons. Camphor exported in 1931 had a value of 1,586,448 yen (yen equals \$0.4985 at par). Mineral production for 1931 was coal, 1,422,000 metric tons; gold, 554 kilograms; silver, 553 kilograms; sulphur ore, 800 metric tons; copper, 1400 metric tons; petroleum production is increasing. The total value of minerals produced in 1931 was 15,141,198 yen. Manufacturing is confined mainly to the making or refining of flour, sugar, tobacco products, oil, iron-work, glass, bricks, and soap. The manufacture of opium, alcohol, salt, sake, camphor, and tobacco products are government monopolies.

In 1931, total imports were valued at 145,622,123 yen (includes 114,763,307 yen from Japan proper); total exports, 201,424,107 yen (includes 201,424,107 yen to Japan proper). The budget for the fiscal year ended Mar. 31, 1933 was estimated to balance at 98,090,805 yen. In 1930 there were 1886 vessels aggregating 3,640,258 tons entered the ports of Formosa. At the end of 1931 government railways extended 549 miles; privately owned plantation railways, 1383 miles; about 2500 miles of highway suitable for motor traffic. In 1931-32 there were 876 miles of telegraph lines; and 2286 miles of telephone lines.

The civil government of the island is administered by a Japanese governor-general, supported by a force of Japanese police. Governor-General in 1933, M. Ohta. See JAPAN.

FORTIER, SAMUEL. An American mechanical engineer, died in Oakland, Calif., Aug. 19, 1933. He was born at Leeds, Que., Canada, Apr. 24, 1855. On his graduation from McGill University in 1885 he came to the United States, entering the employ of the Denver Water Co. as first assistant engineer. From 1890 to 1893 he was chief engineer and superintendent of the Ogden Water Works and of the Bear River Canal and Irrigation Co. While acting as professor of civil and hydraulic engineering at the Agricultural College of Utah during 1893-97 he served also as hydrographer for the United States Geological Survey and as consulting engineer for irrigation enterprises. In 1899 he was called to the Montana Experimental Station as director, acting also during the next four years as resident hydrographer of the United States Geological Survey in Montana and as irrigation engineer for the United States Department of Agriculture.

Placed in charge of the Pacific Coast district of irrigation investigations of the United States Office of Experimental Stations in 1903, Dr. Fortier was promoted four years later to chief of the irrigation investigation bureau of the United States Department of Agriculture, and in 1912 was advisor to the government of British Colum-

bia on irrigation law and its administration. From 1915 to 1922 he was chief of the division of irrigation investigations for the United States Bureau of Public Roads and from 1922 to 1924 associate chief of the division of agricultural engineering. Appointed senior irrigation engineer for the United States Department of Agriculture in 1924, he was made three years later principal irrigation engineer. After his retirement from the Federal service in 1930 he was professor of irrigation at the University of California. He was the author of numerous State and government publications on irrigation subjects.

FORTIFICATIONS. See MILITARY PROGRESS. **FOUNDATIONS.** The year 1933 has been marked by an unusual number of interesting and, in large part, unique foundation undertakings among which the outstanding constructions include a remarkable, in fact record breaking, cofferdam construction, that for the North River Piers in New York, the Bay Bridge Caisson at San Francisco, the sinking of the shaft for the Antwerp Tunnel in Belgium, several interesting pier constructions, and the core wall problem for the Quabbin Dam in Massachusetts. In the building field, however, there has been practically no activity and, accordingly, no notable foundation problems have developed.

THE NORTH RIVER PIERS, NEW YORK. These three great piers, located between 48th and 52nd Streets on the west side of Manhattan Island, are each 1100 feet long and 125 feet wide with slips between 400 feet wide. In these slips a 46-foot depth, capable of accommodating the largest liners, was required.

The outer ends of the piers are of the usual timber pile construction, common to New York Harbor. In the inner portion, however, the rock surface rises rapidly and a large volume of heavy rock excavation was required.

Instead of attempting subaqueous work, the contractor, A. N. Spooner & Son, Inc., enclosed the entire rock area of this contract in a huge cofferdam. The area enclosed was then pumped out, the rock excavation was carried out in the dry, and the concrete walls for the bulkhead and shore end of piers and footings for the pier structures were completed.

This remarkable cofferdam, running 1450 feet along the river and with end walls 295 feet long (total length 2039 feet) was composed of 43 cells of steel sheet piling each 50 feet square. The bottom of the dam was reinforced with heavy rock fill but, in spite of this reinforcing, the heavy pressure from the outside forced the cofferdam in 5 feet at one point. Motor trucks, operating on ramps, were used to remove the excavated material.

ANCHORAGE PIER, BAY BRIDGE, SAN FRANCISCO. The pier constructions for the west section of this structure (the entire work consists of two great bridges and the connecting tunnel through Yerba Buena Island) involve caissons of unusual size. These have been made at the Moore Dry Dock Company's plant in Oakland, floated to the site and sunk in position.

The central or common anchorage pier for the two 2300-foot West Channel Suspension is particularly noteworthy. Its cutting edge was 92 by 197 feet in plan and 17½ feet high. Before launching on August 11 the assembly (side construction, bracing, etc.) was carried to a height of 77½ feet. This huge box was then floated to position and sunk to rock by the open dredging method

at the remarkable depth of 226 feet below bay level.

GOLDEN GATE BRIDGE PIERS. The San Francisco pier of this great bridge rests on a bed of serpentine 1000 feet offshore from Fort Point. This rock, swept clean by swift tidal currents, is 52 to 87 feet below m.l.w. (mean low water). The plans called for placing the foundation of the pier, 90 by 185 feet in size, at 100 feet below water level. To permit a caisson of this size to be securely landed at the site and to protect the finished pier, a concrete fender construction 27½ feet thick was built to surround the site. Several features of the plan are worthy of note.

The contractor began by building a construction trestle out from shore. The rock surface was then excavated in a unique manner. Operating from a derrick barge, the rock was shattered, not by drilling in the usual manner but by using dynamite bombs dropped through a 12-inch blasting tube or pipe. Holes 18 feet deep and about 10 feet apart in each direction were made in this way and single bombs of 200 pounds were then lowered in these holes and exploded. Shattered rock was removed by a clamshell bucket and dumped into deep water.

Half of the fender was then built by placing tremie concrete in steel forms. The caisson was moved into position and sunk and the fender completed. The 3-foot space between caisson and fender was finally filled with concrete up to the original surface after the bottom of the caisson had been stopped off by placing forms under air pressure from inside the working chamber. The remaining space to water level was clay filled and, inside this cofferdam, the caisson was unwatered and the pier constructed in the dry.

This method avoided the difficulties of sinking the caisson 35 feet in rock under air pressure. The North, or Marin, Pier presented no unusual difficulties as it was close to shore and is located on rock near the water surface.

NEW ORLEANS BRIDGE. In constructing the piers for this bridge, located about 10 miles above the Old City section of New Orleans, an interesting modification of the sand island method, previously employed on the Suisan Bay Bridge near San Francisco, was used.

Due to the danger from scour around the caissons, a woven willow mattress 250 by 450 feet in size was ballasted with sandstone and sunk at each pier site.

On the mattress a huge steel pipe section was then sunk, the mattress was cut through, and the shell settled several feet into the river bottom. The usual procedure was then followed, the shell being filled with sand and the caisson constructed on and sunk through the island thus formed. Open dredging was used to carry the piers to the unusual depth of 180 feet.

ATCHAFALAYA RIVER BRIDGE. The sinking of the pier caissons for this three 600-foot simple truss bridge over the Atchafalaya at Morgan City, La. presented an unusual problem. The river bottom consisted of a semi-liquid silt for a depth of 30 or 40 feet. This material was so fluid that the caisson sank of its own weight to a depth of 43 feet in the river bottom (53 feet below water level). Soil was also forced up in the inner shaft and had to be excavated to prevent its forming a plug and stopping further movement. After excavation a steel deck was placed across the caisson above the cutting edge and it was carried to a depth of 129 feet, under pneumatic conditions,

that required the maximum permissible air pressure of 49.5 pounds per square inch. Finally the excavation was continued by open dredging until the caisson rested on a bed of fine sand at a depth of 176.5 feet below water level.

ANTWERP TUNNEL. The construction of the ventilator shafts for this Belgian tunnel furnished interesting examples of the rather unusual freezing process. These shafts are about 600 feet from the river edge and are 53 by 56 feet in section. They rest on a bed of clay 85 feet below high water. The contractor drove 116 wells in two concentric circles, 78 and 86 feet in diameter. These wells were of 6-inch pipe driven to a good seal in the clay bed. A 2-inch pipe was used to carry brine to the bottom of each well, while proper connections at the top of the wells completed the circulation for the refrigerating system. Walls of ice and sand, some 10 or 15 feet thick and entirely surrounding each site, were frozen in this way. The unfrozen cores were then excavated, without sheeting, and the concrete shafts constructed in the open. See TUNNELS.

VANCOUVER TUNNEL. The shaft sinking operation for this water tunnel, being built by the Greater Vancouver Water District under the First Narrows at the entrance to Vancouver Harbor, B. C., is also a notable work. A 400-foot shaft is required to reach the tunnel level and this shaft had to penetrate 100 feet of sand before it could be sealed and work carried forward in the open. The sand island method was used to start the shaft which was sunk by open dredging, bowlders being blasted out by using numerous small dynamite charges.

QUABBIN DAM CORE WALL. The core wall for this work on the Boston Metropolitan District water supply extension is an interesting example of the pneumatic caisson cofferdam method. The wall is 1500 feet long and was sunk to rock at a depth of 40 to 140 feet below river bed by using a series of pneumatic caissons, each 9 by 45 feet in size and sunk end to end.

Inasmuch as the ground water level at the site was practically at the ground surface, three isolated caissons were first sunk and were then used practically as well points to lower the ground water level. For these first caissons a maximum air pressure of 48 pounds was required. Through the pumping, however, the ground water level was lowered 50 feet and the maximum pressure required in the remaining 25 caissons was only 18 pounds per square inch. Each caisson was sunk as far as possible by open dredging with a clamshell bucket, the working chamber was then shut off and the sinking completed under air.

FOUR H ("4-H") CLUBS. See AGRICULTURAL EXTENSION WORK.

FOURNIER D'ALBE, EDMUND EDWARD. A British physicist, died at St. Albans, England, July 7, 1933. Born in London in 1868, he attended the Royal Gymnasium at Düsseldorf, Germany, and the Royal College of Science in London and served for many years as assistant in the physical laboratories of the Royal College of Science for Ireland and Trinity College, Dublin. While in Ireland he became interested in the Pan-Celtic movement, organizing the congresses held in Dublin in 1901, Carnarvon in 1904, and Edinburgh in

1907, editing *Celtia* during 1901-06, and publishing *An English-Irish Dictionary* (1903). From 1910 to 1914 he was assistant and lecturer in physics at Birmingham University and from 1914 to 1915 special lecturer in physics at the Punjab University, Lahore, India.

Dr. Fournier d'Albe's great contribution was the invention in 1912-14 of the optophone, an instrument which by converting light rays into sound effects enabled blind persons to read ordinary printed matter by ear. Its action was due to the chemical element selenium, whose crystalline variety conducts electricity varying in resistance according to the degree of illumination to which it is exposed. The essential parts of the instrument were a revolving brass disk, perforated with eight rings of holes corresponding in vibration to the notes of a musical scale, a selenium tablet or "bridge" on which a strong current is concentrated after passing through the disk's perforations and over which the printed matter is passed, and a telephone receiver connected with the "bridge" by a high-voltage battery, over which are heard the varying characteristic sounds for each separate letter.

Dr. Fournier d'Albe transmitted also by radio May 24, 1923, the first photographic portrait broadcast from London, and the following year invented a system of wireless telewriting and telephotography based upon acoustic resonance. He was a Fellow of the Institute of Physics, an associate of the Royal College of Science, and a vice-president of the British Radio Association. Among his publications were: *The Electron Theory* (1906, trans. into German, Italian, Spanish, and Russian); *Two New Worlds* (1908); *New Light on Immortality* (1909); *Wonders of Physical Science* (1911); *Contemporary Chemistry* (1912); *Life of Sir William Crookes* (1923); *The Moon-Element* (1924); and *Hephæstus or the Soul of the Machine* (1925).

FRANCE. AREA AND POPULATION. The area of France, including Alsace-Lorraine, is 212,659 square miles and the population at the census of March, 1931, was 41,834,923 (40,743,897 in March, 1926). The estimated population in 1932 was 41,840,000. There were 2,890,923 foreigners in the country in 1931. About half the French people live in rural districts and half in urban communities. In 1932, births numbered 722,246; deaths, 660,882; marriages, 314,878. Comparative figures for 1931 were: Births, 730,249; deaths, 680,710; marriages, 326,358. The leading cities, with their populations in 1931, are: Paris, 2,891,020; Marseilles, 800,881; Lyons, 579,763; Bordeaux, 262,990; Nice, 219,549; Lille, 201,568; Toulouse, 194,564; St. Etienne, 191,088.

EDUCATION. Primary education is free and compulsory for children from 6 to 13 years old. The school system is centralized under the Superior Council of 52 members, which acts in collaboration with the Minister of Education and a consultative committee. In 1930-31, there were 3170 public infant schools, with 343,088 pupils; 503 private infant schools, with 30,241 pupils; 68,700 public primary schools, with 3,759,125 pupils; and 11,646 private primary schools, with 876,310 pupils. Higher elementary schools on Nov. 15, 1930, numbered 561, with 74,782 pupils. For secondary education, there were in November, 1931, 361 boys' schools, with 141,565

students; and 203 girls' schools, with 65,758 students. The 17 free universities in France had an enrollment of 78,674 on July 31, 1931. Various other institutions provided technical and professional training.

AGRICULTURE. France has a well-balanced economic system, with about 41 per cent of the working population engaged in agriculture and with active mining, metallurgical, manufacturing, and fishing industries. The area of France is 136,101,760 acres, of which in 1929, 87,021,115 acres were under crops, in fallow or grass. The forest area was 25,170,407 acres; moor and uncultivated land, 12,561,333 acres. The area and production of the chief crops in 1931 and 1932 are shown in the accompanying table, from the *Statesman's Year Book*.

FRENCH CROPS: AREA AND PRODUCTION

Crop	Area (1,000 acres)		Production (1,000 metric tons)	
	1931	1932	1931	1932
Wheat	12,834	13,389	7,188	9,018
Mixed grains ..	202	180	93	95
Rye	1,838	1,775	750	893
Barley	1,864	1,836	1,039	1,168
Oats	8,558	8,525	4,591	5,129
Potatoes	3,532	3,520	16,300	15,868
Beets	619	624	6,197	7,024

In 1931, 3,827,388 acres under vines produced 1,305,281,000 gallons of wine; the 1932 production was 1,258,490,280 gallons. The value of silk production was 4,197,000 francs in 1932 (14,714,000 francs in 1930). The number of silk producers declined from 35,670 in 1930 to 18,286 in 1932. Livestock on farms at the beginning of 1933 included 2,900,000 horses, 135,000 mules, 228,000 asses, 15,643,000 cattle, 9,762,000 sheep, 6,488,000 swine, and 1,463,000 goats. According to provisional returns, the 1933 wheat crop was 92,170,560 metric quintals, as compared with the 1932 bumper crop of 90,771,340 metric quintals (quintal equals 3.67 bushels). The 1933 wine production was 49,691,000 hectoliters (47,634,000 in 1932).

MINING AND METALLURGY. The French iron ore deposits in Lorraine are among the richest in the world. Coal supplies are insufficient for domestic needs and are supplemented by imports, chiefly from Germany. Production of the chief minerals in 1932, with 1931 figures in parentheses, was (in metric tons): Coal, 46,260,000 (50,016,000), excluding the Saar; lignite, 996,000 (1,040,000); iron ore, 27,768,000 (38,476,000); bauxite, 393,600 (348,000); pyrites, 190,800 (193,000); mineral oil, 85,200 (74,000). Including the Saar, the 1932 coal output was 57,700,000 metric tons. Asphalt, antimony, manganese, lead ore, rock salt, and potash salts are produced in small quantities. The output of iron and steel products, in metric tons, was: Pig iron, 5,549,000 in 1932 (8,250,000 in 1931); crude steel, 5,604,000 in 1932 (7,812,000); steel and iron work, 4,070,000; potash, 321,000. The index figures for the average monthly metallurgical production, based on the 1913 average as 100, declined from 125 for 1930 to 103 for 1931 and 72 for 1932; during 1933 it increased steadily from 76 for January to 92 for June and then declined to 79 for December.

MANUFACTURING. An upswing in manufacturing production began in July, 1932, and continued throughout most of 1933. The general monthly index of industrial production (1913 = 100), which averaged 140 in 1930, 124 in 1931, and 96

in 1932, rose from the low point of 92 in July, 1932, to 112 in June, and 106 in December, 1933. There was a continued decline in unemployment during the same period. On Dec. 23, 1933, the registered wholly unemployed numbered 303,921, compared with 271,856 for the same week of 1932. There were several million workers unemployed or working part time who were not registered. Production of electrical energy amounted to 14,361,000,000 kilowatts in 1931 (15,339,000,000 in 1930). Statistics of manufacturing production in 1931 and 1932 are shown in the accompanying table.

MANUFACTURING PRODUCTION OF FRANCE

Product	1931	1932
Silk (conditioned at Lyons) 1,000 lbs.	7,857	5,058
Wool (conditioned at Roubaix- Tourcoing) do . . .	176,827	172,065
Wool (conditioned at Mazamet) . do . .	53,413	54,577
Cotton consumption " do . .	490,372	493,019
Artificial silk 1,000 lbs.	38,320	47,354
Boots and shoes (estimated) 1,000 pairs	65,000	50,000
Alcohol 1,000 gals.	95,702	102,309
Vessels launched gross tons	103,419	88,000

* Including waste.

COMMERCE. The decline in French foreign trade was continuous from 1930 through 1933, as is indicated in the accompanying table. The recovery noted in the foreign trade of Great Britain, the United States, and several other industrial countries during 1933 was not reflected in French trade figures.

FRENCH IMPORTS AND EXPORTS

[Millions of francs]

	Imports for consumption	Exports of French products	Excess of imports
1929	58,221	50,139	8,082
1930	52,511	42,835	9,676
1931	42,199	30,421	11,778
1932	29,826	19,693	10,133
1933 *	28,425	18,433	9,992

* Preliminary.

The value of the chief imports for consumption in 1932 was (in millions of francs): Cereals, 2854.8; coal and coke, 2402.1; wine, 2316.6; oil seeds, 1332.8; petroleum, 1293.6; wool, 1270.1; raw cotton, 1137.5; machinery, 1076.4. The chief export items, in order of value, were (in millions of francs): Chemical products, 1801.6; iron and steel, 1055; cotton textiles, 971.5; silk textiles, 897.8; automobiles, 548.7; wine, 425.4; soaps and perfumes, 316.7.

The distribution of French trade, by leading countries, in 1931 and 1932, is shown in the accompanying table.

FRENCH TRADE BY COUNTRIES, 1931 AND 1932

[Millions of francs]

Countries	Imports for home use		Exports of French products	
	1931	1932	1931	1932
United States . . .	3,800.5	2,918.5	1,543.1	957.4
United Kingdom . .	3,724.3	2,457.1	5,043.4	1,961.5
Germany	6,141.7	3,618.6	2,748.8	1,669.8
Belgium	3,638.2	2,440.7	3,582.4	2,241.1
Italy	1,486.7	634.7	992.4	594.6
Spain	1,404.8	714.7	685.4	886.2
French Colonies . .	6,214.5	6,220.0	7,318.2	6,202.4
Argentina	1,428.3	1,066.8	514.3	322.1

FINANCE. Commencing Jan. 1, 1933, the French fiscal year, which formerly ended March 31, became the same as the calendar year. Previous fiscal years had closed with successive deficits, as a result of decreased revenues during the

world depression. The budget during these years normally totaled about 50,000,000,000 francs, of which nearly 45 per cent went for military expenditures and the service of the public debt. In 1930-31, actual revenues were 50,988,000,000 francs and the actual deficit was 3,199,000,000 francs. The estimates for 1931-32 balanced at about 50,640,000,000 francs and the actual deficit was 3,148,000,000 francs. For the short budget period of nine months (April to December) in 1932, the estimate balanced at 41,101,000,000 francs and an actual deficit provisionally estimated at 5,000,000,000 francs was incurred. The 1933 estimates anticipated a deficit of over 4,000,000,000 francs, with revenues of 45,600,000,000 francs and expenditures of 49,900,000,000 francs.

Preliminary 1933 returns showed actual revenues of 36,611,000,000 francs, or 487,000,000 less than in 1932. Of the 1933 receipts 28,975,000,000 francs came from indirect taxes, 7,343,000,000 from direct taxes, and 292,000,000 from national property.

Another deficit of from 6 to 8 billion francs was forecast for 1934. During the four years 1930-33, France accumulated a budget deficit of some 40 billions of francs, of which only 15,000,000,000 represented long-term loans. The remainder, in the form of short-term credits, hung over the financial market and contributed largely to the financial difficulties which forced the resignation of successive cabinets in 1933 (see *History*).

The French public debt on Mar. 31, 1932, was reported at 459,745,600,000 francs, compared with 480,821,600,000 francs a year earlier. Of the 1932 total, 243,846,200,000 francs represented the consolidated funded debt, 40,469,000,000 francs the floating debt, and 175,430,400,000 francs the external debt. The franc equals \$0.0392 at mint par.

COMMUNICATIONS. The seven French railway systems had 25,964 miles of line open to traffic in 1931. The largest system (5667 miles) was operated by the state; the remaining six by private companies. In the same year, the main lines of the seven systems carried 777,000,000 passengers and 295,700,000 metric tons of freight, incurring an aggregate deficit of 2,579,500,000 francs. In 1932 the deficit increased to 3,580,500,000 francs. Highways in 1931 totaled about 405,000 miles, of which 22,369 miles were macadam. There were 6160 miles of navigable waterways. On Oct. 7, 1933, the five French commercial air lines were consolidated into one company under government control. In 1931 these lines reported a mileage flown of 5,945,000, with 34,238 passengers, 3,895,000 pounds of freight, and 504,000 pounds of mail carried. Radiotelephone service between Algiers and Paris was opened June 6, 1933.

SHIPPING. The French mercantile marine on June 30, 1932, aggregated 3,556,000 gross tons of shipping, of which 3,304,000 tons represented steam and 203,000 tons motor vessels. The steam and motor tonnage idle on July 1, 1933, aggregated 940,000 (931,000 tons on July 1, 1932). A total of 27,475 ships of 52,641,637 tons entered French ports during 1932, and 18,935 ships of 44,498,396 tons cleared. Marseilles was the most active port. Le Havre and Cherbourg, rivals for second place, handled 16,276,000 tons and 16,783,000 tons, respectively (entrances and clearances). A new landing stage for trans-Atlantic liners was opened in Cherbourg harbor July 30, 1933. A law dated July 20, 1933, provided for the reorganiza-

tion of the *Compagnie Générale Transatlantique* (French Line), by which the French government assumed supervisory powers in return for an annual subvention of 150,000,000 francs and the government's guarantee of a loan of 150,000,000 francs.

GOVERNMENT. The Constitution of 1875 vests executive power in the President, acting through a Ministry selected by him but responsible to parliament. Legislative power rests in the Chamber of Deputies and the Senate, the members of which jointly elect the President for a term of seven years. The Senate consists of 314 members, all 40 years of age or more, chosen by an electoral college for nine years. The Chamber consists of 614 members elected by direct manhood suffrage for four years. President in 1933, Albert Lebrun, elected May 10, 1932. The composition of the Chamber of Deputies elected May 1-8, 1932, was: Communists and Socialist-Communists, 20; Socialists, 130; Republican Socialists and French Socialists, 33; Radicals and Radical Socialists, 153; Independent Radicals, 74; Republicans of the Left, 48; Democrats, 15; Democratic Republican Union, Democratic and Social Action, Independents, 127; others, 15. For Cabinet changes in 1933, see *History*.

HISTORY

An unbalanced budget hung like the sword of Damocles over the heads of four successive French cabinets during 1933, causing the downfall of three of them. Yet the country sank ever deeper into a financial morass. Facing a budgetary crisis as menacing as that of 1926-28, France at the end of 1933 was ready for another Poincaré to restore financial equilibrium. Related to the budget crisis was the battle to retain the gold standard, in a world of rapidly depreciating currencies. Franco-German relations presented another ever-present problem for France, which grew more acute during 1933. The issue of the French war debt to the United States also remained to plague her statesmen. On the other hand, French relations with Italy, Great Britain, and the Soviet Union grew more cordial, largely as a result of Adolf Hitler's spectacular appearance upon the European stage.

PAUL-BONCOUR OVERTHROWN. The Ministry formed by Senator Joseph Paul-Boncour on Dec. 18, 1932, ended its brief and stormy existence on Jan. 28, 1933, when its budget proposals were rejected by the Chamber, 390 to 193. In this, as in succeeding budget battles, the Socialists played the dominant rôle. Following the victory of the Left in the parliamentary elections of May, 1932, the Socialists held the balance of power between successive Left governments and the opposing Right and Centre parties. They had overthrown Edouard Herriot Dec. 14, 1932, by refusing to support his proposal for payment of the December 15 war-debt installment to the United States. Now they withdrew their support of Paul-Boncour's Radical-Socialist government on a budget item providing a 5 per cent reduction in the salaries of civil service employees. The fall of the ministry was accompanied by mass protests against higher taxation staged in Paris by brokers, farmers, and taxpayers' organizations. These and subsequent demonstrations by numerous other interests reflected the wide-spread rebellion among the French taxpayers at the steady increase in taxation over a ten-year period. But the general insistence upon a reduc-

tion in government expenditures was matched by the determination of the civil service and other entrenched groups not to permit governmental economy at their expense. In this conflict of interests, the civil servants enjoyed the decisive support of the Socialist leaders.

THE DALADIER MINISTRY. A new Radical-Socialist ministry, containing many holdovers from the preceding cabinet, was formed January 31 by Edouard Daladier. The Premier also held the War portfolio. Paul-Boncour accepted the post of Foreign Minister. Georges Bonnet, former Minister of Public Works, received the important Finance portfolio. Other important figures were Camille Chautemps, Interior; Pierre Cot, Air Minister; Albert Sarraut, Colonies.

The Daladier Ministry, formed as it was along the same lines as its predecessor, was expected to receive short shrift from the Chamber. It took office at a time when the economic situation was growing steadily worse. Government revenues were declining along with foreign trade and the tourist traffic. The government was called upon to bolster with subventions and loans the railways, shipping lines, and other important national industries. Labor troubles were frequent and the demand for tax reductions grew ever more insistent. The press was critical and reflected the national discontent. André Tardieu, Joseph Caillaux, and others were calling for radical governmental reforms so as to strengthen the executive power.

Amid these multiple difficulties, the new Premier guided his government with masterly skill and tact. Favorably impressed by his declaration of policy, the Chamber approved his ministry by a vote of 370 to 200. The Socialist leader, Léon Blum, indicated that his party would support Daladier "with reservations." This support and even M. Blum's leadership of his party was soon tested in the government's strenuous effort to balance the 1933 budget—a battle which continued until June 1. The first section of the budget law, covering only the month of March, was finally approved by both the Chamber and the Senate on March 1. It provided for economies equivalent to about \$80,000,000 and new or increased taxes totaling about \$126,000,000. The remaining deficit was to be covered by borrowing.

The Ministry's victory in the Chamber on the budget measure, by a vote of 359 to 352, was the result of a split in the Socialist ranks. Of the 128 Socialists in the Chamber, only 24 followed M. Blum in voting against the measure, while 104 voted for it. Another Socialist split occurred in connection with Premier Daladier's successful attempt to secure the adoption of the budget for the entire year 1933. In the vote in the Chamber on the war budget, to which the party was opposed in principle, 90 Socialists voted for military credits rather than countenance the defeat of the cabinet and the probable establishment of a more conservative government. Unable to hold his followers in line, M. Blum resigned as Socialist leader. He was reinstated at a special party conference at Avignon in April, where a majority voted to preserve the principle of nonparticipation in coalition governments.

Meanwhile, Socialist deviations had enabled the Daladier government to pass its most crucial test in the Chamber. The budget bill for the year, as adopted by both houses June 1, still showed

GREAT BRITAIN

an estimated deficit of some 1,200,000,000 francs. But national fears were relieved. Government securities rose sharply on the Bourse. The gold reserve of the Bank of France again increased. And the government was left free to give its undivided attention to the problems confronting it at the World Economic Conference and elsewhere.

The prolonged budget struggle had held up other legislation throughout most of the parliamentary session. Between June 1, when the budget was finally approved, and July 8, the date of adjournment, a number of important bills were rushed through both houses. One law fixed the price of wheat at 115 francs per quintal (220 pounds) for the year beginning July 15, 1933. At the beginning of each month, the price was to be raised an additional $1\frac{1}{2}$ francs. Importation of foreign wheat was suspended for two months. The government was authorized to fix the price of flour and bread and to borrow 400,000,000 francs to put the law into effect. The existing law regulating the wine market was revised. A minimum alcoholic strength for wines placed on the French market was fixed and new plantations were limited for the next five years. Railway legislation was adopted placing two government representatives on the board of directors of each railway. A special commission was set up to supervise the purchase of railway equipment. While refusing to take over the French Line, the government on July 7 secured parliament's approval of a law increasing the state's supervisory powers over the affairs of the shipping concern (see *Communications*). The law of Apr. 1, 1926, by which pre-war rents were raised a specific amount annually, was suspended until July 1, 1934. An amnesty law covering certain political crimes committed before Jan. 1, 1933, also was passed as a bid for further Socialist support.

Before parliament adjourned, M. Daladier received (June 9) an overwhelming vote of confidence on his domestic and foreign policies. He promised his firm opposition to inflation of the currency, reaffirmed the necessity for restoration of the gold standard in countries which had abandoned it, and favored redistribution of the world's gold stocks through a return to normal economic conditions rather than through banking measures. He convincingly defended France's acceptance of the Four-Power Pact (see *ITALY under History*), holding this course necessary to prevent a break with Great Britain and other European countries. During the summer, the Premier greatly improved his prestige and parliamentary strength by his vigorous foreign policy. His firm but conciliatory policy toward Germany, his vigorous defense of the gold standard and of the principles of currency stabilization at the World Economic Conference, and his refusal to meet the June 15 war-debt installment to the United States all met with favor in France. Meanwhile, the economic condition of the country had improved somewhat. On August 26 the number of registered unemployed was 235,850, or 30,000 less than on the same date of 1932. Industrial and commercial activity showed increases in important lines. Yet declines continued in government revenues, railway operations, and foreign trade, as compared with the previous year.

THE SOCIALIST SCHISM. The summer witnessed a steady widening of the rift in the Socialist

ranks on the issue of the party's relations to the Radical-Socialist government. At the regular party conference in Paris in July the majority faction, headed by M. Blum, censured the conduct of the moderates, led by Pierre Renaudel, in voting for the government's budget. Refusing to capitulate, the Right wing members met on July 19 and gave notice that, contrary to party instructions, they could not refuse in advance to vote for the 1934 budget. A Right manifesto issued August 23, signed by 51 Deputies and 8 Senators, reiterated their opposition to the majority's policy. When parliament reconvened October 17 to consider the 1934 budget an open break between the two wings of the party was in prospect. The issue came to a head at the party's national congress held Nov. 4 and 5, 1933. Thirty members, headed by M. Renaudel, resigned or were expelled, leaving only 100 orthodox Socialists in the Chamber.

FALL OF DALADIER. Speaking at the Radical-Socialist party congress at Vichy on October 8, Premier Daladier outlined his policy on the budget and disarmament. He declared that his government was prepared to stand or fall on a financial programme which would insure the safety of the franc and reestablish national financial stability. As to disarmament, he said that his government would refuse any reduction in French armaments without an international agreement for progressive disarmament guaranteed by the establishment of permanent and automatic supervision and control.

The expenditure budget, as introduced by the government, called for appropriations of 50,442,952,000 francs, or a decrease of 43,758,000 francs from the final figures for 1933. Estimated receipts were some 7,500,000,000 francs below this figure. To eliminate this deficit the government proposed a number of new taxes and economies, the chief of which called for a levy of 2,000,000,000 francs upon civil servants and others with stable incomes. The Premier attempted to hold his moderate supporters in line by his economies while winning over the Socialists by radical revenue proposals. He did retain the backing of the Right wing Socialists, but on his proposal to reduce the salaries of government employees the moderate Centre and the Left wing Socialists combined with the conservative Opposition to defeat the ministry 329 to 241 (October 24).

THE SARRAUT MINISTRY. A new ministry was formed on October 27 by Albert Sarraut, a prominent Radical Socialist and a publisher of the influential *La Dépêche de Toulouse*. It included most of the members of the defeated ministry, with the addition of certain leaders of the Centre, such as François Pietri, the new Minister of Colonies. M. Paul-Boncour was retained as Foreign Minister to insure the support of the moderate Socialists and M. Daladier accepted the War portfolio. Other leading members were: Vice President and Minister of Justice, Albert Dalimier; Interior, Camille Chautemps; Finance, Georges Bonnet; Budget, Abel Gardey; and Air, Pierre Cot.

The Sarraut Ministry entered office confronted by a serious budgetary crisis. Its hands were partially tied by the growing tax riots on the one hand and the threat of a strike of civil servants on the other. It faced the seemingly impossible task of placating both the tax payers and the civil servants and at the same time balancing the budget. The transitional character of the

ministry was evidenced in its first appearance before the Chamber of Deputies November 3. It survived by a vote of 306 to 32 but some 276 deputies abstained from voting, including all of Léon Blum's Socialists and most of the other Centre and Right groups.

Although upheld (545 to 11) in its policy toward Germany in a test vote on November 14, the Sarraut Ministry fell on November 24, when it seemed on the point of winning its battle to balance the budget. Its budget proposals, announced November 15, called for administrative economies totaling 3,000,000,000 francs, a 4 per cent cut in government pensions, the elimination of some civil service posts, etc. These measures were expected to reduce the deficit by some 5,363,000,000 francs. Most of them had won the Chamber's approval when Premier Sarraut made the mistake of accepting a Socialist amendment to the budget measure. Deputies of the Centre and Right immediately abandoned their neutral attitude and the ministry was defeated in the next vote (321 to 247).

THE CHAUTEUPS MINISTRY. The new Cabinet formed on November 27 by Camille Chautemps was composed almost entirely of Radical Socialists; it represented merely a reshuffling of the Sarraut Ministry. Both the Socialists and the Republicans—the nearest groups to the Radical Socialists in political complexion—refused to enter the Chautemps Ministry. Consequently, its position was no stronger than that of its predecessors. Besides the Premier, the chief figures were: Foreign Affairs, Joseph Paul-Boncour; War, Edouard Daladier; Navy, Albert Sarraut; Air, Pierre Cot; and Finance, Georges Bonnet.

On its first appearance before the Chamber of Deputies December 2, the Chautemps Ministry received an unexpectedly decisive vote of confidence (391 to 19). Its financial proposal resembled those of the Sarraut Ministry. To meet the estimated 6,000,000,000-franc deficit, it proposed to reduce expenditures, including civil servants' salaries, check up more closely on tax evaders, and to increase taxation on alcoholic beverages, export licenses, and civil servants' salaries of more than 12,000 francs annually. The Socialists again withdrew their support from Premier Chautemps on December 8, when he insisted upon pay cuts for government employees. The following day the Chamber gave him a vote of confidence (345 to 150) on this issue and on December 19 the Senate did likewise (201 to 58), with the Socialists abstaining. As finally passed on second reading in the Chamber December 24, the budget bill provided for 4,632,000,000 francs in economies and new revenues. The budget was still some 1,400,000,000 francs out of balance, but the deadlock had been broken and the Chautemps Ministry had triumphed where its three predecessors had failed. In addition it secured authority from Parliament for a loan of 10,000,000 francs to consolidate the floating debt. On December 24 Parliament adjourned until Jan. 9, 1934.

Although Premier Chautemps' budget victory offered some encouragement, there was considerable pessimism in France as the year closed. Statistics for 1933 showed a sharp drop in the birth rate, a further decline in French savings accounts, an average decrease of 12 per cent in the value of government rentes (bonds), a 6 per cent decline in railway receipts, and an increase in the registered unemployed to 335,000 at the end of the year. Government revenues had declined 487,000,-

000 francs below the 1932 level and trade had slumped also. There was widespread impatience with the government, exasperation at the frequent Cabinet overturns, and demands for reform and governmental reorganization. To make matters worse, one of the most serious railway disasters on record occurred on December 23. A local train crowded with persons going home for the Christmas holidays was struck in the fog at Lagny by the Paris-Strasbourg Express. The death toll was 200 and some 300 others were injured.

FOREIGN RELATIONS. As in previous years, the dominant factor influencing French foreign policy during 1933 was the rise of the Hitler movement in Germany. The accession of Hitler to the Chancellorship of the Reich on January 30 and his subsequent success in crushing the Republic and establishing an undisputed dictatorship eliminated hope in France that the territorial revision of the Versailles Treaty might be accomplished by peaceful means under the aegis of the League of Nations. Nevertheless, the successive Left ministries in power during the year met the German challenge with moderation and restraint. This moderation was induced in large part by the knowledge that Hitler's aggressive policies had completely isolated Germany and secured powerful support for French foreign policies.

At the beginning of 1933, France and her allies in eastern Europe (Poland and the Little Entente) faced the threat of an anti-treaty bloc of nations headed by Italy and Germany and supported by Austria, Hungary, and Bulgaria. The illegal shipment of arms from Italy into Austria and Hungary, revealed by an Austrian Socialist newspaper in January, increased the general tension. France and Great Britain joined in delivering a veiled ultimatum to Austria, which evoked a furious outburst in the Italian press (see AUSTRIA under *History* for details of the Hirtenberg arms affair).

The spectacular realignment of European foreign policies produced by the Nazi régime in Germany was forcibly demonstrated a few months later. Then France and Britain joined Italy in extending the financial and diplomatic support with which Chancellor Dollfuss in Austria was able to repulse the Nazi onslaught and preserve Austria's independence (see AUSTRIA, GERMANY and ITALY under *History*).

The Franco-Italian reconciliation was made possible through the French government's conditional acceptance of the Four-Power pact, proposed by Mussolini and supported by Prime Minister MacDonald of Great Britain. Il Duce hoped that by means of the pact the fundamental differences between Germany and France could be adjusted, with Italy and Britain acting as "honest brokers." Speaking in the Chamber of Deputies April 6, Premier Daladier admitted the possibility of treaty revision by saying that France agreed that no treaty was eternal. France, he asserted, wished to find a pacific procedure of revision which would have the consent of interested states. France was ready to reduce armaments progressively, on condition that no state would attempt to rearm. Accordingly the French reply to the Mussolini proposals, delivered April 11, sought to maintain a basis of collaboration with Britain and Italy, while insisting that the "big four" negotiations should proceed within the framework of the League and that the in-

terests of Poland and the Little Entente be guaranteed.

Before the negotiations on the Four-Power pact were completed, it was rendered useless, temporarily at least, by events in Europe. Nazi propaganda activities in Austria were declared by France in a note of August 6 to the German Foreign Office to be a violation of the spirit of the pact. And with the withdrawal of Germany from the Disarmament Conference and the League of Nations on October 14, the French considered that the pact was automatically dead. On October 17, Premier Daladier made a noncommittal response to Hitler's proposal for direct Franco-German negotiations. "If an entente is sincerely desired," he asked, "why begin with a rupture?" However, Franco-German negotiations for an agreement on armaments were proceeding at the end of 1933, with Italy and Great Britain acting as conciliators.

Italian chagrin at the failure of the Four-Power pact was offset in some degree in November, when the French accepted Mussolini's plan for improvement of economic conditions in the Danubian states (see ITALY under *History*). Previously, the success of Italian diplomacy in checking Nazi absorption of Austria had aroused some alarm in France, where it was feared that Mussolini would take advantage of the occasion to establish Italian hegemony in central Europe. Meanwhile the bonds between France and her allies had been drawn closer by the Nazi menace. For the same reason, the Anglo-French entente reached at the Lausanne Conference in 1932 was cemented more strongly. Common fear of Germany furthered the rapprochement between France and the Soviet Union, which had been inaugurated by Premier Herriot in 1932. On Feb. 11, 1933, the Franco-Soviet non-aggression pact was ratified by the French government, the exchange of ratifications taking place February 15. A visit to Russia in August and September by former Premier Herriot and a party of prominent Frenchmen was followed on September 15 by the arrival at Moscow of Air Minister Pierre Cot at the head of a French air squadron. As the champion of the League of Nations, France won many friends among the smaller countries of Europe and of the world following the German attack upon the League.

FRANCO-AMERICAN RELATIONS. Franco-American friendship had been severely strained toward the end of the Hoover Administration due to French resentment at Mr. Hoover's moratorium proposal of 1931 and American anger at the French default on the war debt payment of Dec. 15, 1932. This irritation was allayed to some extent by the advent of the Roosevelt Administration in March, 1933, and President Roosevelt's friendly gestures. Soon after his inauguration he proposed that France send a representative, preferably M. Herriot, to Washington to confer with him on Franco-American problems. With an entourage of officials and advisers, M. Herriot arrived in Washington April 23. He sailed for home April 28, without reaching any understanding as to war debts, in which the French were primarily concerned. France defaulted on the war debt installments due the United States June 15 and December 15. At the end of the year, this issue continued as the principal source of dispute between the two countries. See **REPARATIONS AND WAR DEBTS.**

The Roosevelt-Herriot conversations were be-

lieved to have laid the foundation for collaboration between their respective countries with regard to "economic disarmament," the restoration of stable monetary policies, the raising of world prices by reducing barriers to world commerce, and the execution of public works programmes. However the abandonment of the gold standard by the United States April 19 had already launched the United States upon an economic policy fundamentally at variance with that of France. The necessities of the domestic situation forced President Roosevelt to repudiate the international economic policies which he had contemplated at the time of his talks with M. Herriot.

The depreciation of the dollar in terms of foreign currencies threatened to drive France off the gold standard. At the World Economic Conference, France headed a bloc of nations in opposing any negotiations upon tariff reductions unless the United States agreed to end the fluctuations of the dollar. The stabilization issue was the rock upon which the conference was wrecked (see **ECONOMIC CONFERENCE, WORLD**). On October 12, France denounced the international tariff truce, which had been entered into by most of the nations of the world in advance of the London conference.

OTHER DEVELOPMENTS. In the Far East, France came into conflict with Japan over the French annexation of a group of small islands in the South China Sea, dominating the sea route to French Indo-China (see JAPAN under *History*). A tariff convention between France and Spain, supplementing that of Oct. 23, 1931, became effective June 23, 1933. An important trade agreement with Canada, signed at Ottawa May 12, became effective June 10, 1933, for one year.

See **UNION OF SOVIET SOCIALIST REPUBLICS** under *History*; **LEAGUE OF NATIONS**; **UNITED STATES OF EUROPE**; **DISARMAMENT**.

FRANZ, SHEPHERD IVORY. An American psychologist, died in Los Angeles, Calif., Oct. 14, 1933. He was born in Jersey City, N. J., May 27, 1874, and was graduated from Columbia University in 1894, receiving the Ph.D. degree from the same institution, after intervening study at the University of Leipzig, in 1899. He served as assistant in physiology at Harvard University during 1899-1901 and as instructor in physiology and medical physics at the Dartmouth medical school during 1901-04. After acting for two years as physiologist and pathological psychologist at the McLean Hospital for the Insane at Waverley, Mass., he was called to George Washington University, holding the chair of physiology in its medical school until 1921 and of experimental psychology in its graduate school until 1924. He acted also from 1907 to 1924 as psychologist, from 1910 to 1919 as scientific director, and from 1919 to 1924 as director of laboratories at St. Elizabeth's Hospital, the government hospital for the insane in Washington. During 1920-24 he was instructor in neurology at the Naval Medical School and during 1922-23 lecturer in psychology at the Johns Hopkins University.

Called to the University of Southern California as lecturer in psychology in 1924, Dr. Franz

served after 1925 as professor of psychology at that institution and also as chief of the psychological and educational clinic of the Children's Hospital in Hollywood. He was president of the Southern Society of Philosophy and Psychology in 1911, of the American Psychological Association in 1920, and of the Western Psychological Association in 1927 and during the War was a member of the psychological committee of the National Research Council. In addition to editing the *Psychological Bulletin* during 1912-24 and *Psychological Monographs* during 1924-27, he published a *Handbook of Mental Examination Methods* (1912), *Nervous and Mental Reeducation* (1923), and *Persons One and Three* (1933) and contributed to the *Psychological Review* and other scientific journals about 100 articles on psychology, neurology, and psychopathology.

FRASER, WILLIAM ALEXANDER, A Canadian author, died in Toronto, Ont., Canada, Nov. 10, 1933. Born in Pictou Co., N. S., in 1859, he was educated at Westchester, N. S., and spent several years as an oil prospector in the Canadian Northwest. He assisted also over a period of nine years in developing the oil resources of India and Burma. He later vividly described the life of these regions in *The Eye of a God, and Other Tales of East and West* (1899); *Mooswa and Other Animals of the Boundaries* (1900); *The Outcasts* (1901); *Sorrow and Old Friends* (1901); *Blood Lilies* (1903); *Sa-zada Tales* (1905); *Thirteen Men* (1906); *The Lone Furrow* (1907); *The Three Sapphires* (1918); *Bulldog Carney* (1920); and *Caste* (1922). Even more popular were his tales of horse racing, including *Thoroughbreds* (1902); *Brave Hearts* (1904); and *Delilah Plays the Ponies* (1927). Among Mr. Fraser's poems were the national song, *Canada, God, and our Land*.

FREEMASONRY. *Universality*. Masonic orators and writers are fond of stressing their order's wide diffusion. "Masonry knows no state line; it is universal," said the Georgia representative at the laying of the new Federal building's cornerstone at Chattanooga, Tenn., Jan. 10, 1933. At the sesquicentennial of the lodge at Larne, Ireland, the orator spoke of their pride in the "great fellowship which spans all distance, bridges all differences of speech and brings men together by a common inspiration." Speaking at an open meeting of Arcadia Lodge No. 2096 of London, Sir Kynaston Studd told of his experience as a member of a deputation which had visited India and noted the leveling effects of bringing together in the same lodge men of diverse creeds and castes. The Provincial Grand Master of Netherlands East Indies reports that

There are quite a few Javanese Masons, also Malays and a few Chinese. No color line is drawn. The Oriental is inclined to a contemplative conception of Freemasonry; the spread of good will among all people and love of humanity has taken deep root among the native brethren.

The Universal League of Freemasons, organized at Boulogne in 1905, held its annual Congress at the Hague, August 31 to September 3. It invites all Freemasons to participate and announces as its aim "the pacification of the world and the universal brotherhood of mankind." In Switzerland, the organization arranges for Masonic pilgrimages—e.g. to Egypt and Palestine.

This feature is best exemplified by a review of affairs in the leading jurisdictions.

America (United States of). On February 22, the George Washington National Memorial Association, held its 23d annual convention in the

auditorium of the new memorial temple at Alexandria, Va. (See 1932 YEAR BOOK, p. 303.) The Virginia Grand Master extended a welcome to the delegates and Alexandria-Washington Lodge, of which the first American President was once Master, entertained them in a stated communication on Washington's birthday. The Northern (U. S.) Supreme Council held its 121st annual communication in Boston, September 26 to 28. Melvin M. Johnson was elected Grand Commander, to succeed the late Leon Abbott, for three years, on September 27th and that evening the 33° was conferred on 60 candidates. On October 8 the General Grand Council of Royal and Select Masters assembled in the Masonic Temple at Washington. Robert A. Woods of Princeton, Ind., was elected General Grand Master for the ensuing three years. The session was followed immediately by that of the General Grand Chapter of Royal Arch Masons, of which William S. O'Hara of Toledo was elected General Grand High Priest. The body declined to approve the so-called council of "allied degrees" recently formed. The Earl of Cassilis, leading Scotch Mason, was among the visitors, and St. Louis was selected as the next place of meeting in 1936. In the following week the Supreme Council of the Southern Jurisdiction (U. S.) was in session at Washington. The number of visitors was smaller than for many years and the customary pilgrimage to Mt. Vernon was omitted. No new active members were elected and there was no award of the grand cross.

The leading Masonic anniversary in the United States was the bicentennial of the Grand Lodge of Massachusetts, observed June 25-28 at Boston. That distinguished body was warranted as a provincial grand lodge by the premier Grand Lodge of England in 1733 and on April 30 of that year, Maj. Henry Price (1697-1780) was commissioned provincial grand master. His jurisdiction was extended, in the following year, over the whole of North America. In 1769, under the authority of the Grand Lodge of Scotland, St. Andrew's provincial grand lodge was opened in Boston with Joseph Warren (later hero of Bunker Hill) as its first master and in 1792, these two provincial grand lodges united to form the present Grand Lodge of Massachusetts, which thus claims to be the premier grand lodge of the United States. At the celebration, representatives were present from the grand lodges of England (Sir Francis J. Davies, Provincial grand master of Worcestershire), Scotland (Lord Belhaven and Stenton, Grand Master, who delivered an address), Nova Scotia, Ontario, Prince Edward Island, Quebec, Queensland, Rio de Janeiro, and 27 of those of the United States. Music was furnished by the Haverhill Masonic choir which rendered "God Save the King," followed by "America" in closing. Past Grand Master, Melvin M. Johnson, delivered the address of the occasion.

Austria. The annual report of Grand Secretary Misaer, of the Grand Lodge of Vienna, at its annual communication on March 11, showed an increase in membership with two new lodges chartered—one in Vienna (Saraastro) and the other at Shanghai, China (*Lux Orientis*). There are altogether 26 constituent lodges, four of which are outside of Austria, with a total membership of 1870. The Grand Lodge addressed a memorial in behalf of peace to the disarmament conference and observed the anniversaries of Haydn, George Washington, and Goethe. Charity was dispensed to a considerable extent during the year.

Belgium. The centennial of the Grand Orient was observed May 4-6 with representatives present from various European grand bodies. A brilliant musical concert marked the opening and there were two banquets—one for the poor (at both Brussels and Antwerp) and the other for members and visitors. A ritualistic session was held on Sunday and a jewel and diploma were awarded.

Brazil. In the year when the national convention began to consider a proposed new constitution the governing bodies of Masonry, the Grand Orient and the Supreme Council, effected a separation and grand lodges have been formed in eight of the states.

British Empire and Commonwealth. England. The number of lodges under the United Grand Lodge increased from 4622 to 4696, during the year and 200,000 Grand Lodge certificates were issued. On July 12, in the presence of eminent Masons, the King and Queen of England opened with ceremony the Royal Masonic Hospital at Ravenscourt Park, London, built at a cost of about \$1,700,000. The dedicatory prayer was offered by the Archbishop of Canterbury and His Majesty, in response to an address by the Duke of Connaught, Grand Master, and uncle of the King, spoke at some length. But the crowning Masonic dedication of the year was that of the Masonic Peace Memorial, at 52 Great Queen St., London, on July 12. The "Memorial" is a huge building which also serves as the headquarters of the Grand Lodge of England and the "central home of the craft." It was recently completed, after 14 years of construction, at a cost of £1,000,000. The dedication ceremonies were conducted by the same Grand Master, now 83 years old.

Around him were other officers of the Mother Grand Lodge, including the Prince of Wales and his younger brother, Prince George, Senior Grand Warden, and representatives of grand lodges of every continent, including many from the United States, and the provincial and district grand lodges. The 2000 who filled the main hall were augmented by about 4000 more in the various other halls of the massive structure which extends 450 feet along Great Queen St. and supports a tower as high as Niagara—100 feet—overlooking central London. The delegations were greeted in the order of the seniority of the jurisdiction which they represented and numerous memorials and illuminated addresses were received.

Canada. The total number of Masons in the Dominion is reported as 201,454 and of lodges, 1379. The *Masonic Sun* of Toronto advocates a stricter investigation of applicants as to character and fitness. Preparations have begun for observing in 1938, the bicentennial of Canadian Masonry. Southern Cross Lodge No. 44 (Scotch Constitution) of Vancouver, B. C., held a session in the Scottish Rite Temple at Tacoma in April and conferred the Master's degree according to the Scotch ritual. About 100 of its own members were present with over 2000 visiting Masons and the Grand Masters of British Columbia, Washington, and Oregon.

Ireland. Increase in membership throughout the jurisdiction as a whole with special progress in the province of Antrim is reported.

New South Wales. The total membership was reported as 64,254; of lodges, 594. Aubrey Halloran was Grand Master during the year.

Queensland. The total membership was reported

as 21,111; of lodges, 354. Sir John Goodwin was Grand Master during the year.

Czechoslovakia. On October 27, the National (native) Grand Lodge celebrated its 10th anniversary. Its heroes, according to a message from its Grand Master, Dr. Charles Weigner, are

Huss, the prophet of freedom of conscience against medieval force; Comenius, the teacher of nations and one of the creators of modern Masonry; Masaryk, a disciple of truth and one of the builders of the new democratic Europe.

The "Jan Huss League of Slav Freemasons in America," made its second annual pilgrimage to Praha (Prague) for the observance of its hero's martyrdom which occurred on July 6, 1415.

China. A new lodge was opened at Nanking under a warrant from the Philippine Grand Lodge. A council representing the various grand jurisdictions working in China has also been formed.

Germany. In April, the Grand Master of the National Grand Lodge was advised by the "Nazi" government that the order would be allowed to continue only by changing its designation to that of the "National Christian Order of Frederick the Great," discontinuing all international relations, eliminating all non-Germans and all secrecy. It will be seen that this meant the practical suppression of the fraternity as theretofore existing; and such has been the result; although some of the bodies purport to continue under the title above given.

Paraguay. Under a decree of the Grand Master, as in Brazil, the Grand Lodge is divorced from the Grand Orient and the Bible is placed on the altar.

San Domingo. On February 27 the annual communication of the Supreme Council was opened at Santo Domingo City. No deaths were reported for the year and 45 new honorary members were elected, one of whom had received his first degree more than 60 years before. Charters were issued for 10 new bodies and steps were taken to revise the liturgies and reprint them as well as the statutes.

Spain. The annual communication of the Grand Orient adopted a Masonic passport in booklet form; provided for a Masonic publishing house; resolved that historical textbooks, especially those for schools, be revised by eliminating references to war and demanding equal rights for Moroccans with Spaniards. Diego Martinez Barrio was elected Grand Master. Deaths reported included José Moreira, 33°, member of the Spanish Grand Orient and Supreme Council, authority on Masonic history in Spain and Spanish America; Carmen of Burgos, Grand Maestra of the Lodge of Adoption Amor and lecturer on special subjects.

CEREMONIALS. Freemasonry, as the successor of a guild of builders, has inherited much of the latter's nomenclature, symbolism, and ceremonial—notably that of

Cornerstone Laying. In 1933, cornerstones of United States public buildings were laid by Masonic Grand Lodges in Chattanooga, Tenn., on January 10; in Atlanta, Ga., on February 11; at Reno, Nev., on May 13; at Norfolk, Va., on September 7; and at Columbus, O., on September 24.

Claremore Lodge No. 53 of Oklahoma, was presented with an old cornerstone which it had laid officially 28 years before and which contained various historical relics. Apropos of the third ceremony above mentioned, the Roman Catholic bishop of Reno, wrote the postmaster of that city,

contending "that the Masons are intruding into a sphere that is public business in this matter." In reply the latter traced the history of Masonic cornerstone laying in this country and declared that "until now, there has been neither assertion nor implication that there was anything objectionable, unrighteous, or offensive in that proceeding."

On July 4, under the auspices of the Centennial Commission, the Grand Lodge of North Carolina reproduced the ceremony of laying the cornerstone of the State capitol at Raleigh 100 years before. It is reported that "thousands lined Fayetteville St." along which the Grand Lodge marched in procession.

Lord Harewood, Provincial Grand Master of West Yorkshire, laid the cornerstone of St. Christopher church at Lower Shiregreen, Sheffield, in the presence of 18 lodge masters, many other Masons and the general public. The cornerstone of a strictly Masonic building was laid for Chatham Hall Lodge No. 152 (warranted in 1810) on June 17 by William Wallace, Provincial Grand Master of Antrim, Ireland.

CHARITIES. A Freemasons' orphanage at Stockholm is claimed to be the oldest Masonic charitable institution. It was founded by Adolphus Frederick, King of Sweden, in 1753, after he had become Grand Master of the order in that country. The Illinois Grand Master called a relief conference of Cook County (Chicago) lodge officers. The Scottish Rite bodies of Tacoma, maintain a Masonic Service Bureau and have obtained employment for nearly 1000. Those of Columbus, O., organized a Masonic Cooperative Bureau for the same purpose. The Shrine, as is well known, maintains numerous hospitals for crippled children. The organization known as the "Grotto," seeks to enable boys of the Masonic Homes to learn trades. Annuitants numbering 2040, are represented as receiving \$110,000 annually from the Royal Masonic Benefit Institution of the United Grand Lodge of England. Subscriptions of Mark Masons of the province of Hertfordshire, to the Benevolent Fund, averaged over £6 per capita. Netherlands Masons dedicated an institute for the blind of both sexes in the presence of Queen Wilhelmina, her daughter, Princess Juliana, and the Prince Consort, who expressed their appreciation of the noble enterprise. The Dominican Supreme Council set aside for charity 10 per cent of all receipts by it or its tributary bodies. The Grand Lodge of New South Wales appropriated £1210 for miscellaneous charities, mostly hospitals, in addition to its regular ones.

CIVIC ACTIVITIES. Lodges of five outside nationalities met in London and resolved on a greater effort for world peace. American Masons are generally strong supporters of the public school system and correspondingly opposed to State aid for private schools of any class. In Montana they helped to defeat on March 1, the bill to furnish free text books to the private schools of the State. In California they participated in the rejection on June 27 of "Proposition No. 4," an initiated bill to relieve from taxation the property of private educational institutions. In Ohio, they assisted in preventing the passage of a measure which would have enabled the parochial schools to share in the common educational funds. The Attorney General had previously rendered an opinion that such a measure would be unconstitutional.

The prominence of royalty and the nobility in

English Masonry finds its reflection in other branches of civic life. Guildhall Lodge No. 3116 of London is but 28 years old and 22 of its Masters, including, as we have seen, the present one, have been Lord Mayors of the city. In the United States, President Roosevelt is the 14th Masonic President, having received the Master Mason's degree on Nov. 28, 1911 in Holland Lodge No. 8. In an address delivered almost exactly eight years later, at the cornerstone laying of the new building of Stansbury Lodge No. 24 (of which he is an honorary member) of Washington City, he expressed himself as

proud to say that no family in the country as a whole is more closely identified with Masonry than the Roosevelt family.

He received the 32° of the Scottish Rite in the Albany Consistory on Feb. 28, 1929 and became a member of Cyprus Temple, Nobles of the Mystic Shrine at Albany, on Mar. 25, 1930. He is also a member of the Grotto and of the Tall Cedars of Lebanon, whom he received at the White House during their annual convention in Washington in May, 1933. Of his Cabinet, Secretaries Dern and Roper are Scottish Rite Masons and Attorney General Cummings has been since Aug. 1, 1892, a member of Hiram Lodge No. 1 of New Haven, Conn. During the evening of February 17, 1933, in Architect Lodge No. 517, New York City, and in the presence of over 1500, President-elect Roosevelt assisted in "raising" to the Master Mason's degree his son Elliott, and later addressed the assemblage.

Mayor LaGuardia of New York City is a life member of Garibaldi Lodge No. 542, of that metropolis and Ferdinand Pecora, who was the Recovery party candidate for district attorney of New York City, and has conducted the banking investigation for the Senate Committee, is Past Master of York Lodge, No. 197 of the same city and was recently appointed deputy district grand master of the 2nd Manhattan district, which has 24 lodges. Many members of Congress, governors, and other high officials of the country are affiliated with the order. Attorney General Bennett of New York, a Catholic, was invited by Truth Lodge No. 888, to deliver its annual greeting to the State's 350,000 Masons.

LITERATURE. The year's output of Masonic publications has not been extensive. One of the most permanent is *The Morgan Episode in American Freemasonry* (The Roycrofters, East Aurora, N. Y., 152 pp.) by Rev. David Upton Mock of Batavia, N. Y., a member of Batavia Lodge No. 475. It followed closely upon *The Strange Disappearance of William Morgan* (Macoy Publishing Co., 302 pp.) by Thomas A. Knight. Both writers lay stress on the fictitious nature of the Morgan story, the evil nature of its promoters and the mercenary and political motives which inspired its exploitation. Another notable work of the year is the second issue of *Freemasonry in the Thirteen Colonies* (Macoy Publishing Co., 273 pp.) by J. Hugo Tatsch, covering a period hitherto much neglected in the history of the American craft. The Grand Lodge of Czechoslovakia has launched a quadrilingual bulletin.

FRENCH ACADEMY. See ACADEMY, FRENCH.

FRENCH CAMEROON. See CAMEROON.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA. A French colonial empire extending in a northeasterly direction from the Atlantic Ocean be-

tween Spanish Guinea and the Belgian Congo inland to the Anglo-Egyptian Sudan. It comprises the four French colonies of Gabun (area, 104,320 square miles; population in 1931, 387,283); Middle Congo (172,411 square miles; population 661,909); Ubangi-Shari (236,363 square miles; population 1,090,084); Chad (398,955 square miles; population 1,053,006). Total area, 912,049 square miles; total population, 3,192,282 including 3806 Europeans. The chief towns are Brazzaville, the capital, 4000 inhabitants; Banqui, 13,301; Fort Lamy, 6100; Libreville, 4326. In 1932 there were 150 schools with a total of 11,266 students.

The products are wild rubber, ivory, coffee, cacao, ground nuts, palm oil, and cotton. Copper, lead, and zinc are found. For 1931, imports were valued at 224,920,537 francs (franc equals \$0.0392 at par); exports, 119,152,370 francs. The general budget for the four colonies balanced at 86,875,000 francs. Local budgets for 1932 were balanced as follows: Gabun, 17,185,000 francs; Middle Congo, 23,600,000; Ubangi-Shari, 17,800,000; Chad, 17,048,200. The public debt, in 1930, amounted to 363,800 francs.

The governor-general, assisted by a secretary-general and a council of government, has general supervision, but each colony is governed by a lieutenant-governor assisted by an administrative council. Governor, Raphael Antonetti.

FRENCH FILMS. See **MOTION PICTURES.**

FRENCH GUIANA, gé-à'-nà. A French colony on the northern coast of South America between Brazil and Surinam (Dutch Guiana). Total area, about 34,740 square miles; total population (1931 census), 29,085 of whom 5954 were in the penal settlements. There are penal settlements at Cayenne and Maroni. Cayenne, the capital, had 12,000 inhabitants in 1931. In 1930-31 there were 3263 students in the various schools.

Agriculture is limited. Only about 7900 acres were under cultivation. The crops consist of maize, rice, gutta percha, tobacco, manioc, cacao, and coffee. The forests are rich in commercial gums and tropical lumber. The important industries are gold mining and the extraction of rosewood essence. In 1931, imports were valued at 42,698,693 francs (franc equals \$0.0392 at par); exports, 30,153,575 francs. Three main highways and many secondary roads connect Cayenne with the centres of population in the interior. The capital has steamboat communication with the other towns in the colony. There are about 30 miles of railway.

The budget for 1932 balanced at 16,578,950 francs; the public debt was 635,000 francs. A governor administers the colony assisted by a privy council, and a council-general elected by French citizens of the colony. French Guiana sends 1 deputy to the French Parliament. Governor in 1933, M. Bouge.

FRENCH GUINEA, gín'-t. A French colony on the west coast of Africa between Sierra Leone and Portuguese Guinea, forming a part of French West Africa (q.v.). Lieutenant-Governor in 1933, M. Vadier.

FRENCH INDIA. The five French dependencies in India along the western coast of the Bay of Bengal about 100 miles south by west of the city of Madras and north of the island of Ceylon. Total area, about 196 square miles; total population (estimated Feb. 26, 1931), 290,460, divided among the five dependencies as follows: Pondichéry, 188,064; Karikal, 58,228; Chander-

nagor, 27,393; Mahé, 11,959; Yanaon, 4816. French residents numbered about 1113. The chief towns are Pondichéry, the capital, with 43,449 inhabitants in 1931; and Karikal, 17,558. In 1930 there were 59 primary schools and 3 colleges with 10,922 students.

Manioc, rice, and ground-nuts are among the main crops. Imports of the ports of Pondichéry, Mahé, Karikal, and Yanaon for the year 1931 amounted to 96,215,000 francs (franc equals \$0.0392 at par); exports 173,695,000 francs. In 1931, 271 vessels entered and cleared the four ports mentioned above. There were 43 miles of railway open to traffic.

The budget for 1932 was estimated to balance at 2,675,595 rupees (rupee equals \$0.3650 at par). The governor is assisted by an elective general council. French India is represented in the French Parliament by one senator and one deputy. Governor in 1933, Adrien Juvanon.

FRENCH INDO-CHINA. A French dependency south of China and east of Siam and Burma, consisting of the colony of Cochin-China; the protectorates of Annam, Cambodia, Tongking (Tonkin), and Laos; and Kwangchow (Kwangchowwan), leased from China in 1898. The capital city is Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices remove to Saigon. The area and population are shown in the accompanying table.

Division	Sq. miles	Pop. (1931)	Capital
Cochin-China ..	24,274	4,484,000	Saigon
Cambodia	69,866	2,806,000	Pnom-Penh
Annam	56,976	5,122,000	Huê
Laos	89,320	944,000	Vientiane
Tongking	44,660	8,096,000	Hanoi
Kwangchow ...	328	250,000	Fort Bayard
Fr. Indo-China .	285,424	21,702,000	Hanoi

The total population included 42,000 Europeans and 418,000 Chinese. Chief cities are Cholon (Cochin-China), 134,000 inhabitants in 1931; Hanoi, 124,000; Saigon, 122,000; Haiphong (Tongking), 122,000; Binh-Dinh (Annam), 74,000; Huê, 124,000; Vientiane, 10,000. In 1931 there were 5164 elementary schools for native children with 330,000 students; 14 high schools with 5036 students; the Indo-Chinese University at Hanoi with 472 Indo-Chinese students, and the school of Medicine and Pharmacy with 80 students.

PRODUCTION. The principal industries are agriculture, mining, and fishing. The region tributary to Saigon is a great rice growing district of the world. Rubber, sugar, cinnamon, and tea are other agricultural products. The 1931-32 production of rice (rough) for Indo-China was 5,612,000 metric tons from 13,105,820 acres. Rubber exported in 1932 amounted to 14,000 metric tons. Mineral production in metric tons was as follows: Coal (1932), 1,680,000; cement (1931), 152,000; natural phosphates (1931), 13,000; zinc (1932 estimate), 10,000; chrome ore (1931), 1400; tin ore (metal content), 1000.

COMMERCE. The various divisions of French Indo-China were united into a Customs Union in 1887. Rice, fish, rubber, coal, pepper, cattle and hides, corn, zinc, and tin ore are the chief exports. In 1932, total exports were valued (preliminary report) at 1,021,000,000 francs (franc equals \$0.0392 at par). The principal imports are metal goods, cotton and silk tissues, kero-

sene, and automobiles. Total imports (1932 preliminary report) were valued at 967,900,000 francs.

FINANCE. There is a general budget for Indo-China and a separate budget for each of the component divisions. The general budget for 1933 balanced at 74,980,950 piastres (piastre equals 10 francs). Public debt of Indo-China on Jan. 1, 1932 amounted to 66,352,400 piastres. Local budgets were estimated to balance as follows: Annam (1932), 8,086,105 piastres; Cambodia (1931), 11,434,020; Cochinchina (1931), 17,000,000; Kwangchow (1931), 620,000; Laos (1932), 4,246,100; Tongking (1932), 12,946,590.

COMMUNICATIONS. On Jan. 1, 1932 there were 5252 miles of colonial routes and 10,222 miles of local roads. Government owned railways (leased in part to private operators) extended 1488 miles in 1931. In the same year there were 4000 miles of telephone line; and 11,425 miles of telegraph line in 1930. Ships entering the ports in 1931 totaled 2094 and aggregated 4,075,394 net registered tons; ships clearing totaled 2020 and aggregated 4,100,012 net registered tons. Weekly air mail service is maintained between Saigon and Europe.

GOVERNMENT. A governor-general heads the government, assisted by a secretary-general, a government council, and a grand council for economic affairs. A French resident-superior administers the affairs of each of the states except Cochinchina which has a governor at its head. Governor-General in 1933, Pierre Pasquier.

FRENCH IVORY COAST. See FRENCH WEST AFRICA.

FRENCH LITERATURE. There is constantly discussed in France the book business crisis, but overproduction of books is what strikes the observer. There is perhaps a relation between the two. Authors, knowing how hard it is to find a market, turn out better copy, which publishers cannot afford to discard. There is, of course, a certain amount of trash, but, on the other hand, so much of general excellence that a selection is very hard to make in this article. Even the Surrealists offer to-day prose that one can understand. The works on literary history of a superior kind have multiplied considerably: it is difficult to keep track of them.

Again, the distinction between literature and non-literature is often non-existent; one knows not where to draw a line. How would it be possible to ignore Maeterlinck's *La grande loi*, or Mauriac's *Le romancier et ses personnages* or *Dieu et Mammon*? In the latter the most successful of present-day novelists (who was elected this year to the French Academy) discusses the relation of the novelist with his characters, and his responsibility when he is—like Mauriac himself—a Catholic writer. Neither can we omit A. Maurois's *Chantiers américains*, written after a trip made specially to observe at first hand the Roosevelt experiments by one of the ablest writers of to-day. The same is true of *Quand Israël n'est plus roi* by the brothers Tharaud, whose fame rests largely on their novels depicting Jewish populations of the Near East. Can we ignore *Londres* by Paul Morand, who published recently his brilliant *New-York*? Or, in the domain of history, Pierre Gaxotte's views on *Le siècle de Louis XV*, a bold attempt at rehabilitating this monarch, or D. Mornet's *Origines intellectuelles de la Révolution*? Even Rosstand's *L'Aventure humaine: Du germe au nouveau-*

né has been everywhere discussed as a literary product.

One must mention also in this connection the constantly increasing number of literary prizes offered in France. Among the more important was the Prix Osiris, valued at 100,000 francs and offered every third year, which went to Camille Jullian, author of the magnificent *Histoire de la Gaule* which raised him to the rank of the great historians like Augustin Thierry and Michelet. The Grand prix de littérature went to Henri Duvernois, novelist and playwright, whose most recent works are *À l'ombre d'une femme*, and the play *Maison de confidences* at the Grand Guignol. The Grand prix du roman (French Academy) was awarded in June to Roger Chauviré for *Mademoiselle de Boisdauphin*, the dénouement of an old, aristocratic family, of which a charming girl is the tragic victim. (Chauviré, who teaches French at the University of Dublin, was known already for a poem *Tombeau d'Hector*, crowned by the Société des gens de lettres, and by his *Geste de la branche rouge, ou l'Iliade irlandaise, inspirée par les Gallois*). Part of the Prix Gobert went to J. M. Carré, author of lives of Goethe, Stevenson, Rimbaud, and, in 1933, of *Voyageurs français en Egypte*. The Prix Lasserre, valued at 10,000 francs, was awarded to Marius Ary Leblond.

The Prix Goncourt, which was awarded to André Malraux chiefly for his last book *La Condition humaine*, depicting the unceasing civil wars in China with a powerful realism skillfully mixed with keen human psychology, was aimed also at his earlier *Les Conquérants* and *La Voie Royale* (having the same background). Geneviève Fauconnier's *Claude*, the story of a woman who courageously struggles with life and wins our sympathy and admiration, carried the honors of the Prix Femina; there may well be many elements of autobiography in this novel, as the author herself is the courageous mother of five children reared on a farm which she herself is managing in the Charente. The Prix Renaudot was taken by the much discussed *Le Roi dort* of Ch. Braibant, a clever picture of a peasant child in Champagne who is to be the heir one day of the family's estate, but is in the meanwhile well under the control of a commanding mother. The style is, at times, shockingly realistic and brutal, and one sees the influence of Céline's *Voyage au bout de la nuit*, which was crowned last year by the same jury and which aroused considerable discussion.

Why not recall that, as in the case of Goethe in 1932, France celebrated the centenary of Walter Scott on January 2, in a great ceremony at the amphitheatre of the Sorbonne, in the presence of the President of the Republic, of the British ambassador, and under the patronage of the Minister of Public Instruction. At the banquet which followed, presided over by the Marquis de Vogüé, the eulogy was delivered by Professor Cazamian.

A remarkable exhibition of *Rabelaisiana* was held in the spring at the Bibliothèque Nationale in commemoration of the fourth centenary of the appearance in print of *Pantagruel*. An exhibition in Bordeaux commemorated the 400th anniversary of the birth of Montaigne, and a statue of the great essayist, by Landowski, was inaugurated at the Sorbonne June 24. (The statue will be placed finally on Place Clugny near-by.)

POETRY. Let us begin by mentioning a few of the Prix de poésie. The French Academy awarded one of 5000 francs to Paul Fort, several years ago elected *roi des poètes*, and the author of the well-

known *Ballades françaises*. La Maison de poésie, fondation Émile Blémont, gave the prix Petitdidier (12,000 francs) to Emmanuel Égarter, for his complete works; the Prix Blémont, to Henry d'Yvignac for *L'Écharpe de Viviane*; the Prix Verlaine, to Henri-Puvis de Chavannes for *Visage de la Terre*; and the Prix Edgar Poe, to René-Louis Piachaud (of Geneva) for *Le Poème paternel*. The Société des gens de lettres awarded the Prix Jacques Normand to Jacques Hameline for *Idole de cendre*, and a special prize of 3000 francs to Mlle. Suzanne d'Olivera Jackowska for her translation in free verse of the best of Poe's poems. The Prix Sully Prudhomme went to Marie-Louise Boudat for *Eve* (the title being borrowed from Péguy). One of the most coveted of the poetry prizes, the Prix Moréas, went to Jean Lebrau for *Images de Moua* and *Ciel sur la Garigue*.

Among the other publications of the year were Saint-Georges de Bouhélier's *Choix de poésie* (the fortieth anniversary of his entering upon a literary career was commemorated by a ceremony at the Sorbonne). Rosemonde Gérard (Mme. Edmond Rostand) published a new volume, *Féeries*, and Fr. Mauriac, the new Academician, brought out *L'Adieu à l'adolescence*. R. Valléry-Radot published an *Anthologie des poètes catholiques* (which completes *Anthologie des poètes religieux* by M. Allem, 1932).

Of the lesser known poets, let us first name some who are inclined to resist modern tendencies, especially Yves-Gérard Le Dantec (poetry critic of *Le Correspondant*) in *L'Aube éolée*; Noël Ruet, in *Cercle magique*; and Gaston Pulings, in *Dans cet exil aride*. Pierre-Jean Jouve betrayed a rather mystic turn of mind, although not religious in the orthodox sense, in his *Sueur de sang*, to which he added a commanding preface. The naïve, delicate, and humane poetry of Banville was reflected in Henri Strentz's *Complainte pour les innocents*. Valéry continued to exert a fascination on poets, for example, in Henri-Gautier du Bayle's *Faste*.

Most poets, however, are trying to strike a new note. Tristan Tzara, former leader of the Dadaists now considered effaced, persisted in his attempts to derationalize poetry; his last volume is called *L'Antitête*. Disarticulated poetry was offered also by Marcel Raval in *Au jour la nuit*, René Laporte in *Le somnambule* (entirely in the domain of Surrealism) and Hubert Dubois in *L'Heure entre chien et loup*. Wild attempts to amaze the bourgeois were found in Ernst Moerman's *Fantômes* and Gisèle Vallerey's *La Chanson de l'esclave*. Jacques Baron in *Peines perdues* (preface by Ribemont-Dessaignes, former Dadaist) gave vent to a general ire. Merouyan Barsamian's *Les Poètes dans l'arche de Noé* was a charming selection of poems about animals.

That poetry is not losing its grip in France is shown in the number of publications discussing poetry. In a preface to a new edition of the *Roman de la Rose*, M. Gorce pointed out a relation between the mystic code of love in the thirteenth century and the biblical Song of Songs.

Attention is especially drawn to A. Bejot's *L'Évolution poétique en France, Du langage à la poésie, du vers bas-latin au vers libre, de l'art naïf à l'art syllabique, du barde celtique au poète d'après-guerre*; M. Raymond's *De Baudelaire au Surréalisme, essai sur le mouvement poétique contemporain* (very much praised); and a curious article in the October issue of *La Nouvelle*

Revue Française entitled "Tableau de la Poésie." Finally P. Valéry's *De la diction des vers*, in which he seems to extend the olive branch to the *poésie pure* of Brémont (see YEAB BOOK, 1929).

Many journals have mourned the death of the poet Fagus (Felix Fayet), and an edition of his works in six volumes is being prepared. An anarchist at first, he died an ardent royalist and Catholic. He was the singer of the primitive soul in all its aspect, the author of *La Danse macabre*, *La Guirlande de l'espousée*, *Frère tranquille*, *A l'enseigneur* (about Shakespeare). Besides Fagus, the death of Rictus (Gabriel Randon), chiefly known as the author of *Les Soliloques du Pauvre*, must be recorded.

THEATRE. There have been an unusual number of successful plays. *Stève Passeur's Une vilaine femme*, which opened in December, 1932, continued in 1933; it was a revival of *Pas encore*, produced in 1927, but considerably altered in plot, the woman who refuses to lose youth being passionately portrayed by Mme. Simone. As to René Fauchois's *Attention à la peinture*, it met with even greater success in the United States in its adaptation under the title of *The Late Christopher Bean*, both stage and cinema.

Among the most successful, or most discussed, plays of the year was *Le Vol nuptial*, by Fr. de Croisset, produced by Baty. It was a very amusing and, at times, somewhat bold love story of a man and a woman, both aviators; the whole success of the play rested on its brilliant wit and clever performance. Whether to attribute the long run of Alfred Savoir's *La Voie lactée* to the real merit of the play or to the fact that the public openly saw in it a personal satire on Sacha Guitry's love affairs, as he parted with Yvonne Printemps, is difficult to say. *Maria*, by the same author, was played by Mme. Simone, with a part not very different from that in *Une vilaine femme*, i.e., a woman à l'âge dangereux. This time, however, she is so conscious of that fact that she willingly frees her lover, who does not want the separation at all, and even provides her substitute; the result was: three wrecked lives. Marcel Achard had a very clever comedy in *La Femme en blanc*, a bewitching woman who delights in nothing else than to create quarrels around her and who enjoys seeing her lover, who is an officer, fight duel after duel for her sake. Late in the year Achard had another clever play, *Petrus*, in which a woman, trying to shoot a man, hits another who promptly falls in love with her. Raynal's play, *La Francerie*, constructed in the same manner as *Le Tombeau de l'Aro de triomphe*, was again a discussion of the War by three symbolical characters (a German officer, a French woman, and a French boy) during the battle of the Marne; the German officer explains why the German plan cannot fail and, of course, it does fail. There was no action but the play received the highest praise from some critics.

Another who belongs to the stage generation now at its best is Jacques Deval. He had two important plays, one more pretentious, the other lighter but on the whole more successful. *Prière pour les vivants*, frankly pessimistic, represented in a series of pictures the "seven ages" of a man mediocre, even harmful to his surroundings. When he dies we see his heir develop into a man of exactly the same sad type, and we foresee his grandson continuing the melancholy tradition. Deval continued this note of gloom in a vein of satire in *Tovaritch*. A couple of the old Russian nobility become, incognito, servants in the house of a

socialist deputy. The amusing situations are easily imagined and the author makes the most of them.

A stirring play was *Milmort*, by Paul Demasy, which, with ruthless frankness but much skill, pictured a situation similar to that presented in *The Barretts of Wimpole Street*, namely, the unnatural love of a father for his daughter. Stève Passeur produced in the fall *L'Amour gai*, in which he turned into gayety his usual bitterness; the public seemed more surprised than pleased. Denys Amiel in *Trois et une* showed three brothers, a sportsman, a financier, and an artist, in love with one woman; she yields to the first, but finally all three leave her. Jean Sarment's *Peau d'Espagne* is pure dry wit—a wealthy shirtmaker poses as an English lord, and a rather disreputable midinette as a languid Spanish lady; the whole world, we are given to understand, is built on such absurd and mutual trickeries.

Jean-Jacques Bernard tried his hand at a risky theme in *Jeanne de Pantin*, an idealistic girl who wants to liberate modern youth from materialism as Joan of Arc tried to free France from the English; it ends in piteous failure. This preaching mood is new with Bernard. The revival of *L'Invitation au voyage*, typical of *le drame par les silences*, was more in his style. Jean Giraudoux in *Intermezzo* turned again to the unreal; this mixture of fairy tale, ghost story, socialism, and politics, although hailed as a masterpiece by the critics, did not retain public interest very long. The veteran Bernstein scored early in the year with *Bonheur*, a play acted by Yvonne Printemps, in which an anarchist wins the love of the cinema star he had tried to kill, but he finally understands that there can be nothing in that love, and just walks off. At the end of the year Bernstein scored again with *Le Messager*. Not quite so original, it was the story of a man who sends greetings to his fiancée by a friend who falls in love with her—all ends piteously.

In spite of scant praise from the critics, Saint Georges de Bouhélier found much public response to his two historical dramas, *Napoléon* and *Danton*. In the former he claimed that the return from Elba was a machination of the English who wanted an excuse to send Napoleon much farther away. The latter was a spectacular presentation of some scenes of the Revolution. There was presented in Geneva Gaston Sorbets's *La Moisson verte*, depicting the hardships brought on a family by the war. The same author gave at the Odéon, in November, *La Colombe poignardée*, recounting a fictitious intrigue during some revolutionary period. The attempt to put on the stage *Les Caves du Vatican* by Gide (Studio des Champs Elysées) met with little success.

Some of the best farcical plays were: *Monsieur le Comte*, by Yvan Noé and Vera Stacpole (based on the old idea of a man who has a double); *Teddy et Associé* by the same Yvan Noé; *Une Poule sur un mur* by L. Marchand; *La Demoiselle de Mamers* by Yves Mirande; *Maman, marietoi* by Dekobra; *La Main dans le sac* by Veber; *Le Téméraire* by H. Decoin. Both comic and sentimental was *Mandarine* by Jean Arnouilh. At the Grand Guignol appeared *Quinze couples*, a number of sketches by various authors.

Sacha Guitry's wit received unusual recognition, his plays being given simultaneously at no less than five Paris theatres. His new plays included *Adam et Eve* (one act, at the Comédie Française), *Le renard et la grenouille* and *Un*

Tour au Paradis (Michodière), and *Châteaux en Espagne* (Variétés).

Events in Germany brought to the limelight three plays: *Les Juifs* by Tschikieroff (translated by Mme. J. J. Bernard, and played by the Pitoëfs at the Vieux Colombier), *La Maison d'Israël* by Matei Rousson and Adolph Orna (Renaissance), and *Ezechiel* by Albert Cohen which caused quite a scandal at the Théâtre Français.

Henri Ghéon remained the moving spirit of the *Compagnons de Jeux* who offer plays in the spirit of the medieval mysteries. In January he gave a *Job*. He produced also a morality play, *Violante, comédie romanesque en quatre journées sur un thème de Tirso Molina*, which was acted by the *Compagnie des Quinze*; it was a very free adaptation of a Spanish play by Tirso, Don Juanesque in character. A splendid contribution was made by the recently founded *Compagnie de la petite scène* (who act in a hall holding about 100 persons); they give classical plays by young actors, such as Marivaux's *Prince travesti*, or modern plays, like Bernard's *L'Invitation au voyage*.

Several extremely clever adaptations of foreign plays were acclaimed in 1933; indeed one may almost say that they were the sensational successes of the year. Early in the spring appeared Porché's adaptation of *La Paix* by Aristophanes; then Charles Vildrac's adaptation of *Songe d'une nuit d'été* (Shakespeare's *Midsummer's Night Dream*). More successful even was another Shakespearean play, *Richard III*, as arranged by Obey for Dullin of the Atelier. Finally there was *Coriolan* (Shakespeare's *Coriolanus*) at the Théâtre Français. Dostoevski's *Crime and Punishment* produced by Baty, was seen by all Paris, as was also Ben Jonson's *Volpone*, adapted by Jules Romains and Zweig. Two plays by the Danish author, Mme. Karen Bramson, *Le Professeur Klenow* and *Bonheur*, attracted much attention. Another Scandinavian play was Strindberg's *Mademoiselle Julie*. Schnitzler's *Liebelein* was less successful. Quite modern plays thus adapted were Roland Mackenzie's *Musical Chairs* (Polka des chaises); and, strangest of all, *Abie's Irish Rose* arranged by no less than Tristan Bernard under the title *Bloch de Chicago*.

The appearance of Emete Zacconi, the famous Italian actor, created quite a furor. He gave some Ibsen, some Shakespeare, some Turgeniev, and Mirbeau's *Les Affaires sont les affaires*.

The marionettes of Salzburg (especially in *Vie scandaleuse et fin terrifiante du célèbre magicien, le Docteur Johann Faust*) and the Italian Piccoli met also with great success. Here may be mentioned the inauguration in the presence of the Minister of Public Instruction of a new Guignol for children in the gardens of the Luxembourg.

The Prix Eugène Brieux, after long tergiversations, was finally awarded to André Obey for his *Bataille de la Marne* (given in 1932), and for the preceding year to Antoine for his general achievements for the stage.

Many books dealt with the problems of the stage or with individual playwrights, such as Lugne Poë's continuation of his memoirs, *Sous les étoiles*; Antoine's *Le Théâtre*, II; Edmond See's *Mouvement dramatique*, 1932-33; and A. Mortier's *Quinze ans de théâtre*, 1914-1930. There were also discussions by Jean Richard Bloch on *Le Destin du théâtre* (he wants something new) and by F. Proché, who is particularly severe on the Théâtre Français, in *La Revue de Paris* for September 15th.

The great actor, Firmin Gémier, died November

26. René Benjamin published *Sacha Guitry, roi du Théâtre*.

THE NOVEL. For the most important prize novels, see the foregoing. In the March issue of *Les Marges*, Eugène Monfort, the veteran novelist, challenged the tendency of those endless novels in several volumes which he calls "romans fleuves" and which may be a reaction against the "romans ruisseaux" of which we had many for some years; neither is to be advocated. All the same, the "romans fleuves" keep coming out. René Behaine's *Histoire d'une société* reached its ninth volume with *La Solitude et le silence* (pessimistic). Romain Rolland's *L'Âme enchantée* reached the Tome II, *L'Enfantement*, of Part IV (pacifist), Jules Romains published the fifth and sixth volumes, *Les superbes* and *Les Humbles*, of *Les Hommes de bonne volonté* (unanimism theory). Jacques de Lacretelle gave the second volume, *Les Fiançailles*, of *Les Hauts-Points* (a family which wants to keep its hereditary domain). H. Béraud produced the third volume, *Ciel de suie*, of his powerful historical epic, *Conquête du pain* (here he judges rather severely the spirit of Lyons). Jean Richard Bloch began a *roman en série* with *L'Aigle et Ganymède* (an enthusiastic American, through her art of dancing, enthuses the Parisian bourgeois). Finally a talented newcomer, Robert Francis, in a novel of almost 600 pages, *La Grange aux trois belles*, began the history of a family under the Third Republic.

One of the most praised single volume novels of the year was Marcel Prévost's *Ebroue*, the name of a faithful servant of an old professor who, under pretext of extreme care, seems to plot against him with the agreement of his wife. Abel Hermant in *Le Fils d'un Inca*, which may remind one of Voltaire's *L'Ingénu*, uses the old theme of a primitive observing our civilization. J. J. Tharaud had one of the most original and timely novels of the year, *La Jument errante*, in which is sketched the history of the Jewish race through the centuries. Roger Martin du Gard in *Vieille France* gave a vivid but not very charitable picture of provincial life (a shrewd postman who knows how to know all the private affairs of people on his route and pulls all sorts of strings). Ed. Jaloux in *La Grenade mordue* exposed with some bitterness the artist life in Paris.

Eugène Monfort published *L'Évasion manquée* (of a husband); J. H. Rosny, aîné, *Le bel amour de Jeanne de Navres* (a late love), and *Helgvor du Fleuve bleu* (one of his prehistoric novels); and J. H. Rosny, jeune, *La Cité infernale* (the slums of Paris). H. Bordeaux in *Les Déclassés* portrays a man who wants generously to marry below his social class, but is misunderstood by his new mates. In *Guiette, Marie, Louise, Minie* he describes a lover attracted by four charming girls. Pierre Benoit in *Port de France* struck a very different note with the wild adventure of a Martinique girl, in love first with a very civilized Parisian, and then falling under the fatal influence of a beastly mulatto (romanesque enough!). A. de Chateaubriant, author of *La Brière* (Grand Prix du roman, 1923), came before the public this time with a very symbolic story of a *gentilhomme breton* who discovers on his estate a treasure of very unusual nature, namely, a butterfly which "by contemplation" assumes the color of the leaf on which it settles—so ought man to attain an end by contemplation and not by action; the hero converts a young man to his views.

Paul Margueritte in *Nos égales* continued his

campaigns for feminism, pacifism, and other reforms. G. Duhamel in *Le Notaire du Havre*, as in the *Salavin* series, which came to a close with *Tel qu'en lui-même*, turned his attention to mentally mediocre humans (here especially a sort of Micawber). Mauriac in *Le Mystère de Frontenac* studied (as in *Le Nœud de vipère*, 1932) the complex feelings that family ties will create—not always of the best sort. Mme. Colette scored with *La Chatte*, in which the sensual, cruel beast is not the cat but the woman. Simone Ratel was awarded for *La Maison des Bories* the Prix interallié (this award, which corresponds to the Prix Renaudot, is given by journalists while awaiting the decision of the Prix Femina, in the Parisian building called *La Maison interalliée*); she tells one of those gloomy family dramas which in literature are quite in fashion to-day. Similar unpleasant stories were: Deberly's *Le Fils indigne*; Aug. Bailly's *L'Excommuniée*; J. Jolinon's *L'Arbre sec*; M. Genevoir's *Gai l'amour* (a rustic Phèdre); Jean Prévost's *Rachel*; A. Lamandé's *Jeu d'amour*; and Ch. Géniaux's *Découverte de l'amour*.

Collette Yver lashed the *affolés d'argent* of recent years in *Mammon* 1924. E. Pérochon (*Les Yeux clairs*), Jean Giono (*Le Serpent étoilé*), and Ch. Silvestre (*L'Orage sur la maison*) offered novels in their usual style. Francis de Miomandre in *Les Egarements du cœur* pictured a situation which reminds one very much of Rostand's *Cyrano de Bergerac*. Francis Carco in *L'Ombre* probed once more, as in his famous *L'Homme traqué*, the problem of conscience after a crime.

One of the real successes of the year in the domain of the novel was André Chamson's *L'Auberge de l'abîme*, the story of a man who after the disbandment of Napoleon's army in 1815 meets with a tragic fate at the hands of a world full of rancor for the soldiers of the era just closed. M. Larrouy, author of *Odyssée d'un transport torpillé*, gave another of his sea stories in *Cargo tragique*. And here is the place to mention E. Peisson's *Parti de Liverpool*, which claims to tell (under another name, however) the true story of the *Titanic* disaster. In Kessel's *Wagon-lit* there is a picture of the cosmopolitan mobs traveling; the author sketches chiefly Russians. A. Billy in *Princesse folle* portrays the modern girl, somewhat as Henry James did in *Daisy Miller*.

Scenes of real savagery were offered in André Savignon's *Au petit bateau*. In Demaison's *Tropiques* we have, this time, not the taming of wild beasts but the nefarious effect of climate on white men living in Africa. Ph. Hériat, the famous young author of *L'Innocent*, depicted cruel moral suffering in *La Main tendue*, reminding one thereby of Daudet's *Le petit chapeau*, but the story is told with less humane feeling. The same author in *Araignée du matin* told a story of friendship but among weak specimens of humanity. Four renowned women writers produced acceptable novels: André Cortis in *Appel de flammes*, Marie-Louise Paileron in *Si j'avais su*, Germaine Acremant in *Les Ailes d'argent*, and Irène Némirowski in *L'Affaire Kourilof*. Fr. Lefèvre in *L'Amour de vivre* gave, without much reserve, the story of a *coq de village*, while Drieu de la Rochelle tried to portray a modern Don Juan in *Gilles*.

Populism seemed somewhat in retreat in 1933. The Prix du roman populiste went to Henri Polès for *Sophie de Tréguier*. Except for Léopold Chauveau's *Pauline Gropsain* and two volumes of short stories, E. Dabit's *Faubourgs de Paris* and

Jean Pallu's *Marées* (sort of film scenarios), there was nothing to mention.

For amusing novels there were Henri Ormesan's *Le Candidat Lauriston*, a satire on politics in Corsica, and G. de la Fouchardière's *Joseph Pantois, fils de gendarme*. Two war novels were published. One was by the late Dumur, *Lafayette, nous voilà*. The other, *Ainsi que l'albatros*, rather a post-war novel, was by Phil Barrès, author of *La Guerre à vingt ans*.

The following are mentioned for the original themes presented: H. Dorgelès's *Comme au ciel* (scholars who are trying to discover some medical secrets); J. Malègue's *Augustin ou le Maître est là* (a distinctly Catholic novel which was one of the most praised of the year, receiving the Prix Northcliffe); Jean Cassou's *Souvenirs de terre* (two souls, damned for having violated their religious vows of chastity as monk and nun, converse in after life; they are still passionately in love, but are deprived of their bodies to satisfy that passion).

Among the authors who recently came to the front was Roger Verceel, whose *Au large de l'Eden*, a story in the polar seas, was striking for its gripping power, being awarded the Prix Femina Américain, and who added another strong novel by the end of the year, *Le Maître du rêve* (a sort of *Père Goriot*). Pierre Mélon, a lawyer in Lyons, won the Prix littéraire du Temps with *Achmet Reis*; this is a sixteenth century story of a handsome African pirate, with many love adventures and other adventures, pigmented by the account of a long and carefully prepared vengeance. Another new comer was Albert Soullou, who plans a series of novels under the general title *Le Temps promis*; the first volume, called *Elie ou Ford*, questioned which was to win, industrialism or *le lyrisme aîlé*. René Jouget in *Le Jardinier d'Argentueil* discussed the gamblers on the stock market, gold, inflation, etc., while Raymond Desorties in *Le Tétrabie* evoked a monster machine which will combine ship, automobile, and aircraft. Pierre Neyrac in *L'Indifférence perdue* tried to win public applause by using the brutal style that so well succeeded with *Céline* last year. Jean Blanzat's *A moi-même ennemi* pictured those humans who delight in being unhappy, while Paul Nizan in *Antony Bloyé* depicted the weakling in the style of Duhamel's *Salavin*.

The best volumes of short stories were: Pierre Millé's *La Femme et le député* (title of the first story); Paul Benoit's *Chavalier 6*, followed by *L'Oublié*, and four other stories; P. Bourget's *L'Honneur du nom*, and four other stories; A. Maurois's *L'Anglaise et d'autres femmes*; H. Pourrat's *Sorciers du canton* (the writer's authority on peasant folklore and superstitions has long been recognized); and Paul Morand's *Rococo*. Gabriel Nigod was awarded the Prix de littérature régionaliste for *Contes de la Limousine*. The Belgian, Jean Tousseul, had three striking stories in *Le Passé*.

Two books on the novel were A. Bopp's *Tout sur le roman*, and Jacques Arnaut's *Le Roman de tous les romanciers, les situations*.

VARIOUS ITEMS. Some of the books belonging here have been mentioned already in the first part of this article. One must add, in the first place, several autobiographical works by men of letters. There is a new volume by Barrès, *Mes cahiers*, V, which brings the series almost to a close. Then there is Henri Lavedan's *Avant l'oubli*, very charming souvenirs of childhood, reminding one

of those by Anatole France. A. Hermant's *Souvenirs de la vie frivole* recalled more of the cold Stendhal. Pierre Champion's *Mon vieux quartier* (the Latin Quarter) was very rich in documentation. The still very young Henri de Montherlant in *Mors et Vita* gave war remembrances and published again the famous *Chant funèbre pour les morts de Verdun*. Young also is Jules Supervielle, the poet born in Montevideo, who called his book *Boire à la source*. R. Escholier told of his childhood in *Gascogne*.

To this group belongs also Maurois's *Mes songes que voici*; Jacques Chadourne's *L'Amour du prochain*, in which he summarizes the psychology of his well-known novels; and Fr. Nohain's *Guide du bon sens*. Philosophizing on literary topics we have Émile Bauman's *Le Cantique éternel*; *la symphonie du désir*, in which, as a good Catholic, he emphasizes the nothingness of human love (*Amour d'égarément, even amour satanique*) in the case of such famous characters as Sappho, Iseult, Julie de Lespinasse, Emma Bovary, Don Juan. Profoundly Catholic too was Mauriac's *Pèlerins de Lourdes*. Le Goffic in *Brocéliande* exalted the poetry of Celtic legends, while René Lalou's *Le Clavecin non-temperé* appealed to eclectic tastes. Fr. Nohain published a new installment of his *Fables*. In *Affaires de mœurs*, one will find a selection of the best pages of one of the keenest satirists of modern life, La Fouchardière, whose daily column in *L'Œuvre* delights thousands of Frenchmen every day.

French authors still continue to travel and record their impressions. Very successful was H. Béraud's *Le Feu qui couve* (will it be war?). Paul Morand, after *Paris* (1932), offered a no less acceptable *Londres, par un écrivain qui a traversé 150 fois la Manche*. Suarès pictured a Marseilles under the title of *Marsiho*. Two books on Egypt attracted much attention: Fr. Carco's *Palace Egypte* and Jacques Boulenger's *Au fil du Nil*; and we might add here Jean-Marie Caré's *Écrivains français en Egypte*. The posthumous *Marchés d'esclaves*, by Kessel, revealed that slavery is far from being a dead custom to-day. History and literature, no less than geography and literature, remained in close contact in such works as Suarès's *Vues sur Napoléon*; Octave Aubry's *Trahison de Marie-Louise*; and Maurois's *Edouard VII et son temps* (trans. *The Edwardian Era*).

Some interesting biographies were Guy de Pourtalès's *Wagner*; Ed. Jaloux's *Goethe*; and J. Boulenger's *Nostradamus*. Dr. Cabanès published two volumes on *Les Condé, Grandeur et décadence d'une famille princière*. H. de Versonneix's *Sabrez*, the recollections of a cavalry man who served at the opening of hostilities in the World War when cavalry was much in demand. Olivier Cérans passed from cavalry to infantry and gave his *carnet de route in Du sabre à la baïonnette*.

Owing to the popularity of Mérimée's *Colomba* in the United States, the novel has been filmed; and so has *Madame Bovary*. An edition of Romain Rolland's *Jean-Christophe* for children has been prepared by Mme. Hélier-Malaurie in two volumes.

LITERARY HISTORY AND CRITICISM. Chronologically arranged were R. Fawtier's *La Chanson de Roland, étude historique* (which discusses Bédier's theories); M. Wilmette's *Le Poème du Gral et ses auteurs*; F. Desonay's *François Villon*; Kathleen Chesney's *Guillaume Cretin, Œuvres poétiques*; Noël Dupire's *Le Rhetoricien Jean Molinet, 1435-1507*; Plattard's *Montaigne et son temps*; Bonnerot's *Pour bien lire Montaigne*; G.

Cohen's *Ronsard, vie et œuvres*; Magendie's *Le Roman français au 17^{me} siècle*; and P. Emar'd's *Tartuffe, sa vie, son milieu et la comédie de Molière* (which identifies Tartuffe with Charpy de Ste. Croix, of the Compagnie du St. Sacrement). H. Lyonnet's *Les Premières de Molière*; J. Lhermet's *Pascal et la Bible*; A. M. Schmidt's *Saint-Evremond ou l'Humaniste impur*; E. Bauman's *Bossuet moraliste*; H. Brémond's Tome XI, *Le Procès des mystiques, de l'Histoire littéraire du sentiment religieux en France depuis la fin des guerres de religion jusqu'à nos jours*. (The death of the author means that the work stops here).

The sixth volume of *L'Histoire de la littérature française* (under the direction of Calvet), G. de Gigord's *De Télémaque à Candide*; J. M. Carré's *La Philosophie de Fontenelle, ou le sourire de la raison*; Claude Ferval's *Madame du Deffand, L'esprit et l'amour au 18^{me} siècle*; André Cazès's *Grimm et les Encyclopédistes* (important); *Correspondance générale de J. J. Rousseau*, vols. 18 and 19 (up to 1770); and P. Trahard's fourth and last volume of *Les Maîtres de la sensibilité au 18^{me} siècle* depicted the eighteenth century. For the nineteenth and twentieth centuries there were Hugo P. Thieme's *Bibliographie de la littérature française de 1800 à 1930* (3 vols.), with a complementary *Essai sur la civilisation française*; J. Gastard's *La Jeunesse de René* (Chateaubriand); Pierre Moreau's *Conversion de Chateaubriand*; Marie-Jeanne Durry's *La Vieillesse de Chateaubriand* (2 vols.); Baronne Constant de Rebecque's *Julie Talma à Benj. Constant*; Marcel Morand's *Le Romantisme français en Angleterre, 1815-1848*; Bailly et Harris's *État présent des études Lamartiniennes*; and V. Giraud's *La Vie tragique de Lamennais*. Victor Hugo received special attention with the publication of R. Escholier's *La Place royale et Victor Hugo* and F. Gregh's *L'Œuvre de Victor Hugo* (once holder of the Hugo chair at the Sorbonne), while several volumes of Hugo's works were issued as the *édition nationale*—*Les Châtiments* (2 vols., ed. by Berret), *Chansons des rues et des bois* (ed. by Mme. Daubray), and one volume of plays (*Torquemada*, Amy Robsart, and *Les Jumeaux*, ed. by Mme. Daubray).

Balzac by E. R. Curtius, the famous German critic, has been much praised in the French edition. There were also L. Allard's *La Comédie de Mœurs en France*, II, 1815-1830; Galopin's *Frédéric Ozanam* (belles-lettres); G. Jarbinet's *Les Mystères de Paris*; A. Boschot's *Théophile Gautier*; Maxime Leroy's *Taine*; Gerard Gailly's *L'unique passion de Flaubert*, Mme. Arnoux; R. Dumesnil's *Flaubert*; Jacques Chenevière's *La Comtesse de Ségur*; Abbé Le Muer's *Vie et œuvre de Coppée*; Fr. Porché's *Verlaine tel qu'il fut* ("ange et pourceau"—some pronounced the book great, some the opposite); Benjamin Fondane's *Rimbaud le voyou*; Paul Chauveau's *Alfred Jarry, ou la naissance, vie et mort du Père Ubu*; H. Tabureau, *Guillaume Apollinaire* (which created a revival of interest in that original figure); Ch. Sénéchal's *Romain Rolland*; Daniel Rops's *Péguy*, and J. J. Brousson's *Les Vêpres de l'Avenue Roche* (new revelations of Anatole France by his discharged secretary).

The twentieth century already seems to be ripe for critical appreciation. Thus we have Ch. Sénéchal's *Les grands courants de la littérature française contemporaine*; René Groos's *Les Lettres de 1900 à 1933: Poésie, théâtre, critique, roman*; J. Erhard's *Le Roman français depuis Marcel*

Proust; J. Charpentier's *Estuanié, romancier du mystère*; L. P. Quint's *André Gide, vie, œuvres*; and R. Schwob's *Le vrai drame d'André Gide*. G. Cohen published in a small volume his *Explication du cimetière marin par Valéry*. A valuable volume by E. L. Tinker was devoted to *Les Écrits de la langue française en Louisiane*.

The fourth part of the *Dictionnaire de l'Académie*, has been issued, as well as a new edition of the much discussed *Grammaire de l'Académie*, with various corrections. There was also a vindication of the latter published by C. Aymonier, *La Grammaire de l'Académie et ses critiques*. A new volume was added to the monumental *L'Histoire de langue française* by Ferd. Brunot, which terminates the eighteenth century, and Millet had an important work on *La Grammaire et la Phonétique, ou l'enseignement des sons du français depuis le 16^{me} siècle à nos jours*.

LITERARY EVENTS. There is not much to mention that has not been said before. An inscription was placed on the house of Anatole France, Quai Malaquais, Paris. A statue was erected in the Place Malesherbes, Paris to Alexandre Dumas, père, and dedicated on November 5.

Abel Bonnard was received in the French Academy on March 16, while Fr. Mauriac, who was elected on June 1, was received on November 16.

NECROLOGY. The list is long this year: Abbé Henri Brémond, and Camille Jullian, both of the French Academy; Valléry-Radot (author of the famous *Vie de Pasteur*); Comtesse de Noailles; G. de Pawlowski (the genial author of *Voyage au pays de la 4^{me} dimension*, and dramatic critic of the *Journal de Paris*); Professor Zyromski, of Bordeaux (famous for his studies on Sully-Prudhomme, Lamartine, and the Guérins); Marc Elder (winner of the Prix Goncourt in 1913); A. Lamandé (author of *Vie gaillarde de Montaigne*); L. Dumur (novelist, and for years secretary of the *Mercur de France*); and Othon Guérac, of Cornell University (author of *Les Citations françaises*). The poets, Fagus and Rictus, as well as the actor Gémier, have been mentioned before.

FRENCH SOMALILAND, sö-mä'lë-länd, or **FRENCH SOMALI COAST**. A French colony between British Somaliland and Eritrea in East Africa, occupying the western shore of the southern entrance to the Red Sea and extending inland about 56 miles from the coast. Total area about 8880 square miles; population (July 1, 1931), 69,362 including about 1362 Europeans. The port of Djibouti, the capital, had 11,366 inhabitants in 1931, of whom 628 were Europeans. The coast fisheries, salt mines, and inland trade are the chief sources of livelihood. In 1931, 22,000 metric tons of salt were exported. Trade in 1931, most of it in transit to or from Ethiopia, comprised imports of coal, sugar, cotton goods, and butter with a total value of 220,006,000 francs and exports of salt, coffee, ivory, skins and hides, etc., with a total value of 189,911,000 francs (franc equals \$0.0392 at par). Railway mileage in 1932 was 59 miles. There were 546 steamships aggregating 2,053,600 tons entered the port of Djibouti in 1931. The budget for 1932 was estimated to balance at 14,935,350 francs. The colony is administered by a governor, assisted by an administrative council. Governor in 1933, M. Chapon-Baissac.

FRENCH SUDAN. A colony of France and a division of French West Africa (q.v.). The government is administered by a lieutenant-governor,

under the governor of French West Africa. Lieutenant-Governor in 1933, M. Fousset.

FRENCH WEST AFRICA. A French colonial empire in West Africa comprising the interior and Atlantic colonies shown in the accompanying table.

Colony *	Sq. miles	Pop. (1931)	Capital
Dahomey	47,131	1,112,000	Porto Novo
Dakar, Circle of	61	53,982	Dakar
French Guinea . .	96,888	2,236,968	Conakry
French Sudan . . .	581,933	3,568,925	Bamako
Ivory Coast	184,247	3,885,153	Bingerville
Mauritania	322,252	823,819	Saint Louis
Niger, Colony of	482,577	1,810,953	Niamey
Senegal	77,731	1,584,273	Saint Louis
French W. Africa	1,792,220	14,575,973	Dakar

* Upper Volta ceased to be a colony on Jan. 1, 1933, and its territory and population were divided among three other colonies as follows: French Sudan received 20,226 square miles and 713,167 inhabitants; Ivory Coast, 59,212 square miles and 2,018,837 inhabitants; Niger, 27,290 square miles and 268,239 inhabitants. The lieutenant-governor of Mauritania resides in Saint Louis in the colony of Senegal.

The total population for 1931 included 21,088 Europeans of whom 14,400 were French. The principal native tribes are the Ouolofs, Bambaras, Mandingos, Peuhls Faulbés, Mossi, and Kroumen. In 1931 there were 870 schools with 62,708 students, including 195 evening schools for adults with 9089 pupils. The chief towns were Dakar, with 42,000 inhabitants in 1931; Saint Louis, 30,000; Porto Novo, 27,000; and Bamako, 20,000.

PRODUCTION, ETC. The 1931 production of the chief agricultural products was: Ground-nuts, 510,232 tons; palm oil (raw), 50,500 metric tons; cacao, 19,212 tons; cotton, 4842 tons. Other products are crude rubber, gums, fruits, timber, and hides as well as such native crops as millet, maize, and rice. Cattle raising is extensively carried on.

In 1931, total imports were valued at 707,858,471 francs (of which 388,209,645 francs were from France); total exports, 651,272,975 francs (of which France took 399,357,133 francs). The general budget for French West Africa for 1933 balanced at 179,723,000 francs. For 1932 the total budget balanced at 811,470,582 francs, of which 185,538,000 francs represented the general budget, 477,856,357 francs the aggregate of the local budgets, and 148,076,225 francs the supplementary budgets. The public debt on Jan. 1, 1930 was 304,000,000 francs. In 1932 there were 25,000 miles of telegraph line, 2126 miles of railway in operation and 606 miles under construction. A total of 10,371 vessels aggregating 9,677,461 tons entered and cleared the ports in 1931.

GOVERNMENT. A governor-general, assisted by a council, administers the entire colony. Each colony is under a lieutenant-governor, Dakar and Dependencies being under a governor of colonies, all subordinate to the governor-general. The military force maintained in peace time consisted of 17,400 men, of whom 2720 were Europeans. Governor-General in 1933, M. Brévié.

FREQUENCY AND TIME CONTROL. See ELECTRIC LIGHT AND POWER STATIONS.

FRIENDLY ISLANDS. See TONGA.

FRIENDS, RELIGIOUS SOCIETY OF. A mystical religious sect which originated in England in the middle of the seventeenth century. For early history see THE NEW INTERNATIONAL YEAR BOOK for 1932.

FIVE YEARS' MEETING. In 1902 the largest body

of the Religious Society of Friends, known as the Orthodox Group, organized the Five Years' Meeting. This organization meets as a delegate body every five years and in 1933 consisted of 12 yearly meetings, with a membership of approximately 80,000. Its headquarters are in Richmond, Ind. The work of the various departments, such as missions, peace, prohibition and public morals, religious education, is under the direction of executive committees and secretaries of boards. The Five Years' Meeting also maintains seven colleges for higher education; Earlham in Richmond, Ind.; Penn in Oskaloosa, Iowa; Guilford in Guilford, N. C.; Wilmington in Wilmington, Ohio; Whittier in Whittier, Calif.; Nebraska Central in Central City, Nebr.; and Friends University in Wichita, Kans. Haverford College in Haverford, Pa. is maintained by the Philadelphia Yearly Meeting and Pacific College in Newberg, Ore., by the Oregon Yearly Meeting. The latter bodies, however, and the Ohio Yearly Meeting are not a part of the Five Years' Meeting. In 1933 the membership of the Oregon Yearly Meeting was 3135; of the Ohio Yearly Meeting 5607; and of the Philadelphia Yearly Meeting (Orthodox), approximately 4732. *The American Friend*, a bi-weekly religious journal, is published at headquarters, as is also literature for the Bible Schools of the Five Years' Meeting.

LIBERAL BRANCH. This branch was formed in 1827 as the result of a separation which centred around the doctrinal issues of the day and with which the name of Elias Hicks is associated. The Liberal Branch includes seven Yearly Meetings federated in the Friends' General Conference, which meets in even numbered years and conducts work in religious education, social service, and advancement of Friends' principles. The society emphasizes the freedom of the individual to follow the voice of God in his own soul rather than any external or church authority. The membership in 1932 was 16,251, and there were 135 meetings. Publications include the weekly periodical, *Friends' Intelligencer*, and a monthly magazine for children, *Scattered Seeds*. The society conducts several secondary schools, and Swarthmore College in Swarthmore, Pa., was founded by it. It coöperates with other branches of Friends in supporting the American Friends' Service Committee for international understanding and service in this country and abroad, and in Pendle Hill at Wallingford, Pa., a Quaker educational institution for graduate study in religion and social science.

FRUIT (APPLES, ORANGES, PEACHES, ETC.). See HORTICULTURE.

FRY, ALFRED BROOKS. An American engineer, died at Coronado, Calif., Dec. 4, 1933. Born in New York City, Mar. 3, 1860, he attended the engineering school of Columbia University and acted as a marine and mechanical engineer from 1879 to 1886. In the latter year he entered the civil service as assistant engineer in the construction of public buildings for the United States Treasury Department. On the outbreak of the Spanish-American War he enlisted, being made acting chief engineer for the United States Navy. In 1899 he was appointed chief engineer and superintendent of construction for Federal buildings in New York, retaining this position until the entry of the United States into the World War when he was made engineer aide to Admiral Bird and industrial manager of the Third Naval District. He was commissioned captain in the United States

Naval Reserve in 1918, seeing service at the New York Navy Yard, at sea, and in French and English ports. He was also a member of the board of consulting engineers for the improvement of New York State canals during 1904-11, and in 1914 was appointed consulting engineer to the Department of Water Supply, Gas, and Electricity of New York City. In 1921 Mr. Fry served on the special Panama Canal Commission and the following year was consulting engineer to the transport service of the United States Army. During 1924-26 he was supervising engineer for the Federal government at the port of New York. He then became chief inspection engineer for the supervising architect of United States public buildings on the Pacific Coast and after 1927 was consulting engineer. In the New York Naval Militia he rose from engineer-lieutenant in 1892 to commander and chief of staff in 1910, retiring in 1924 with the rank of rear admiral. He was a past president of the Society of Constructors of Federal Buildings and American member of the International Congresses of Navigation.

GALSWORTHY, JOHN. A British novelist and playwright, died at Hampstead, near London, Jan. 31, 1933. Born at Coombe, Surrey, Aug. 14, 1867, he was educated at Harrow and at New College, Oxford, where he took honors in law. After being called to the bar in 1890, he abandoned this profession and went globe trotting. Three years later, while sailing from Australia to South Africa on the *Torrens*, he became friendly with the mate, one Joseph Conrad. From a remark made by Galsworthy in later years—"I was writing fiction for five years before I could master even its primary technique"—it is possible that he had been writing at that time. He learned his craft laboriously, and it was not until he reached 40 that he achieved artistic maturity. His early fiction, published under the pen-name of John Sinjohn, included *From the Four Winds* (1897); a collection of foreign adventure stories; the artificial novels, *Jocelyn* (1898); *Villa Ruben* (1900); and *A Man of Devon* (1901); the genesis of *The Forsyte Saga*, dealing with an episode of Swithin Forsyte's youth. The first work to be published under his own name was *The Island Pharisees* (1904; revised, 1908), which was of value for its criticism of British social conventions.

Galsworthy's first novel of note was *The Man of Property* (1906), a satire on the modern capitalist whose great weakness, as impersonated by Soames Forsyte, is a possessive instinct which blinds him to all spiritual and aesthetic values. It was followed by *The Country House* (1907), the satire of which was directed against the limiting traits of the English country gentry, the adherence to tradition and to the letter of outmoded laws and customs; *Fraternity* (1909), whose ironical title referred to the artificiality of any attempt at fraternization of the English classes; *The Patriotic* (1911), the story of an aristocratic family bound by an inflexible adherence to caste; and *The Freelanders* (1915), which dealt with the social tyranny over their tenants exercised by some landowners. Galsworthy next displayed his talent as an analyzer of the emotions

of romantic passion in *The Dark Flower* (1913), which while delicately executed had as its theme one of unfortunate morbidity; *Beyond* (1917), which presented the feminine side of the grand passion; and *Saints Progress* (1919), which dealt with changing moral standards in war-time.

Prior to the appearance of *The Forsyte Saga* (1922) Galsworthy's work was but little known or appreciated outside of England. This was a trilogy, containing, in addition to *The Man of Property*, *In Chancery* (previously published in 1920), *To Let* (1921), and the interludes, *Indian Summer of a Forsyte* (1918) and *Awakening* (1920), and was soon acclaimed as one of the great works of fiction of the twentieth century. In it the author showed his perfect delineation of character, so painstakingly carried through four generations of Forsytes as to seem actual and intimate biographies. It also afforded a study in the contrasting manners, morals, standards, and ideals of each succeeding generation, with the possessive, materialistic instinct the dominating trait of the Forsyte clan. A sequel to *The Forsyte Saga* was *A Modern Comedy* (1929), containing three previously published novels, *The White Monkey* (1924), *The Silver Spoon* (1926), and *Swan Song* (1928), and the two interludes, *A Silent Wooing* and *Passers By*, which gave the reader further glimpses of the Forsyte family and its friends in a modern setting. Shorter tales relating to this fictional family were published in *Caravan* (1925) and *On Forsyte 'Change* (1930).

Galsworthy's most recent novels were *Maid in Waiting* (1931) and *Flowering Wilderness* (1932), part of another Forsyte trilogy entitled *End of the Chapter*, the third volume, *One More River*, in manuscript at the time of his death, appearing posthumously in 1933. Among his prose sketches and essays were *A Commentary* (1908); *A Motley* (1910); *The Inn of Tranquillity* (1912); *A Sheaf* (1916); *Five Tales* (1918); *Another Sheaf* (1919); *Tatterdemalion* (1920); *Captures* (1923); and *Castles in Spain* (1927). *The Burning Spear* (1923) was a satire on war-time mentality. His poetry included *Moods, Songs, and Doggerels* (1911) and *Verses New and Old* (1926).

Galsworthy was a master of the didactic drama, most of his plays being pleas for the oppressed and outcast. This was notably true of *The Silver Bow* (1906), with its theme of different legal justice for rich and poor; *Strife* (1909), the tense and moving story of a strike; *Justice* (1910), a protest against solitary confinement and other cruelties of the English prison system; *The Pigeon* (1912); *The Fugitive* (1913); and *The Mob* (1914). Among his other plays were *Joy* (1907); *The Little Dream* (1911); *The Eldest Son* (1912); *A Bit o' Love* (1915); *The Foundations* (1916); *The Skin Game* (1920); *Six Short Plays* (1921); *A Family Man* (1921); *Loyalties* (1922); *Windows* (1922); *The Forest* (1924); *Old English* (1924); *The Show* (1925); *Escape* (1926); *Exiled* (1929); and *The Roof* (1929).

Galsworthy declined knighthood in 1918, but in 1929 received the Order of Merit, one of the highest honors bestowed by the empire. After a lecture tour in the United States in 1919 he frequently returned, making long sojourns in California, Arizona, and Florida. His last visit was in 1931. In addition to being an honorary Fellow of New College, Oxford, and an honorary cor-

responding member of the American Academy of Arts and Letters, he received the honorary degrees of Doctor of Laws from St. Andrews University and Doctor of Literature from the Universities of Manchester, Dublin, Cambridge, Sheffield, Oxford, and Princeton. His career was crowned with the award of the Nobel Prize for Literature in 1932, but his failing health prevented him from attending the presentation exercises held in Stockholm in December of that year.

GAMBIA. A British colony and protectorate in West Africa occupying 6 miles on each side of the Gambia River from the sea to approximately 200 miles inland in a straight line (300 miles by river). Total area, 4134 square miles; area of the colony, which consists of the towns of Georgetown and Bathurst with adjacent land, 69 square miles. Total population (1931 census), 199,520. Bathurst, the capital, had 14,370 inhabitants in 1931. In 1932, Bathurst had six elementary and four secondary schools with 1966 pupils enrolled, and a teacher manual training school with 20 students on the register. In the protectorate the government school at Georgetown in MacCarthy Island Province had 43 students.

Groundnut cultivation is the principal industry. Cotton is grown in some provinces. Maize, rice, guinea corn, cassava, and sweet potatoes are grown for local consumption. Groundnuts exports in 1932 amounted to 37,315 tons valued at £391,659; palm kernels, 722 tons valued at £5550. In 1932, imports (including specie £5141) totaled £297,841; exports (including specie £199,020), totaled £606,514. Revenue for 1932 amounted to £208,132; expenditure, £196,015; the surplus of assets over liabilities on Jan. 1, 1933 amounted £75,026. The colony is administered by a governor assisted by an executive and a legislative council. Governor and Commander-in-Chief in 1933, H. R. Palmer.

GANDHI, M. K. See INDIA.
